REMARKS

1. Dr. Gordon Dunning called on 14 May and asked if we had considered the advisability of instrumenting the callibration shot of the scavenging test to obtain data useful in connection with the biological test. I told him that this was a matter that we had not discussed, but that it seemed quite logical to me that it be done providing the instrumentation did not delay the scavenging test. I pointed out that we were contemplating an amount of tracer much smaller, and a bang much bigger than in the biological test. He acknowledged that these were difficulties but said that he felt that we would be remiss not to put in the extra instrumentation.

2. Commander Wagner called and told me that the Corporation had indicated that they were willing and probably able to conduct the biological parts of the test. This is a switch from what he told us
