Drug Study for Flying Personnel

USAFSAM (SMG)

1. We have been directed to evaluate the effects of combined anti-malarial prophylaxis under simulated flight conditions. It is requested that arrangements be made to obtain a group of 4 volunteers, from airmen completing basic training at Lackland AFB, every 40 days until a total of 20 volunteers have been obtained.
2. It is requested that these volunteers be made available to this study for a period of not longer than 80 days beginning 1 February 1967.
3. It is requested that the undersigned be afforded the opportunity to interview potential volunteers for this project at such time as may be considered appropriate by training officials at Lackland AFB. I may be contacted at Brooks AFB, extension 4227, to make the necessary arrangements.
4. Volunteers must agree to take antimalarial drugs (primaquine, chloroquine and dapson) and to undergo periodic taking of blood samples, the use of diagnostic radioactive materials, and exposure to simulated altitudes of not more than 18,000 feet in the altitude chamber. All procedures are relatively innocuous but may produce transient discomfort.
5. Authority to use human volunteers in this project (Project 7755) is contained in a letter from Hq USAF (AFMSPAB), 13 October 1965, Approval of Projects Using Human Volunteers (See attachment 1).
