INTRODUCTION:
FILES OF THE ATOMIC ENERGY COMMISSION
DIVISION OF MILITARY APPLICATIONS
IN DEPARTMENT OF ENERGY PROGRAM OFFICE CUSTODY

by Roger M. Anders

Office of Human Radiation Experiments

Deputy Assistant Secretary for Planning and Administration

Assistant Secretary for Environment, Safety and Health

January 1996

The Department of Energy and Its Heritage: The Department of Energy (DOE) is one of the most diverse agencies in the Federal government. It was created in 1977 from a score of organizational entities from a dozen departments and agencies. DOE encourages the development of energy technologies in several areas--solar, geothermal, fossil fuel, and nuclear. It develops technologies aimed at promoting conservation of energy resources. DOE is one of the largest Federal agency supporters of basic scientific research and manages a research complex that includes some of the nation's premier laboratories. DOE helps formulate national policies for energy use and development. Perhaps surprisingly to many, DOE also runs the nuclear weapons research, development, and production complex as well as associated dismantlement and clean up activities.

DOE's nuclear weapons heritage comes from the World War II Manhattan Project which built the atomic bomb. The threads of DOE's involvement with nuclear weapons run through the following agencies: the Manhattan Engineer District (1942-1947), the Atomic Energy Commission (1947-1975), and the Energy Research and Development Administration (1975-1977). DOE not only took over functions, cultures, and traditions from these agencies, it also inherited records from them. Of these agencies, the longest lived and most controversial was the Atomic Energy Commission (AEC). The AEC also created a greater volume of records than any other DOE predecessor agency and, not surprisingly, DOE still has custody of a substantial volume of AEC records. Of the AEC records in DOE's custody, the files created by the AEC Division of Military

Applications are among the most valuable because they document government nuclear weapons research, development, testing, and related activities over a thirty year period. They contain detailed information about the AEC weapons activities and, consequently, many of the files remain classified today. DOE has custody of all extant AEC Division of Military Applications files.

The Atomic Energy Commission: From its inception in 1947 until its abolition in 1975, the AEC carried out a Congressional mandate for a large federal role in atomic energy development. The AEC maintained programs for nuclear weapons research, development, production, and testing; production of plutonium and weapons grade uranium; milling and refining of uranium ore; biomedical research into the effects of radiation and nuclear weapons; basic nuclear research in fields such as chemistry, physics, and metallurgy; development of nuclear reactors; promotion of a civilian nuclear power industry; and conduct of international Atoms-for-Peace activities. It was unique among federal agencies in combining responsibilities to both promote and regulate a technology.

The activities to which the AEC devoted the most effort were those related to military applications of atomic energy. The importance of a large and diverse arsenal of nuclear weapons for nation defense seemed self evident to the Nation and the agency during the Cold War. Thus, both the President and Congress saw creating and maintaining a strong nuclear arsenal as a top priority for the AEC throughout the Cold War period. Congress thought the task so important that, in the Atomic Energy Acts of 1946 and 1954, it specified that the AEC would have a Division of Military Applications which would be responsible for conducting research into the military applications of atomic energy and engaging in the production of nuclear weapons.

The AEC Division of Military Applications Files: The Division of Military Applications files document the activities in which the organization engaged. Obviously, they are a prime source for documenting AEC nuclear weapons programs. In addition to capturing the implementation of policy decisions, they contain important documentation on policy debates and decisions, among them that to develop thermonuclear weapons.

The AEC Division of Military Applications files were once maintained by a central mail facility. They were highly classified, stored in a single large vault area, and arranged according the agency's subject/numeric filing system. Subsequently the files were removed from this vault area and custody divided between the DOE History Division and the DOE Office of Defense Programs.

The files described on the attached inventories are all in the custody of the Office of Defense Programs. As the inventories show, these files have been divided into sixteen separate collections. Each collection, of course, contains only a small portion of the AEC Division of Military Applications files. The inventories are attached in order of the number given to each collection by DOE records management personnel.

The attaching inventories list most, but not all, AEC Division of Military Applications files which are in Office of Defense Programs custody. A few files have been placed in other collections which are composed primarily of records created by the Energy Research and Development Administration or by the Department of Energy.

The AEC Division of Military Applications files described on the attached inventories contain information on both the historically important and the mundane. Important subjects covered by the files include test ban and disarmament negotiations; nuclear mutual defense agreements and activities; program organization and management; nuclear weapons research, development, production, and testing; and nuclear weapons safety.

Arranging for Access to the Division of Military Applications Files in Program Office Custody: Access to unclassified portions of AEC Division of Military Applications files in Office of Defense Programs custody may be arranged by contacting Ms. Lorretta Bryant on 301-903-5176. (Access to unclassified portions of the AEC Division of Military Applications files in History Division custody may be arranged by contacting Ms. Betsy Scroger on 301-903-8767.)

For Further Information: Additional information on the AEC Division of Military Applications can be found in Roger M. Anders, *The Office of Military Applications* (Washington, D.C.: Department of Energy, 1980). A copy of this pamphlet is also attached.

Introduction

For the United States, along with the rest of the world, the military applications of atomic energy became frighteningly real with bombings of Hiroshima and Nagasaki. With the sudden end of World War II, the nation turned from unrestricted military development of the atom to control of its awesome power. In October 1945 the Truman administration began to grapple with the problem of controlling the atom by submitting to Congress a bill for an atomic energy commission. The administration's proposals for controlling atomic energy were considerably modified during the legislative process but by August 1946 an Atomic Energy Act was signed. During Congressional debates on the atomic energy bill, one of the major issues raised was whether atomic energy should be controlled by a civilian or military agency. For this reason the Atomic Energy Act of 1946 contained specific provisions defining civilian and military responsibilities. The Act established a civilian commission and authorized it to conduct experiments and do research on the military applications of atomic energy and to engage in the production of atomic weapons. To carry out these functions the Act established a Division of Military Application, whose director was required to be a member of the armed forces. In addition the Act established a separate organization, the Military Liaison Committee, which was to advise the Commission on the policy level of military requirements.¹

The New Division

On January 1, 1947 the fledgling Atomic Energy Commission took control of the nation's atomic energy programs and facilities from the Army's Manhattan Engineer District. Almost from its inception, the research, development, and production of nuclear weapons became the Commission's primary task. Despite the inherent "line" nature of the job, the Commission initially saw the Division of Military Application as primarily a "staff" organization. The division was to "be concerned with the broad and complicated interrelationships between military planning and the research, development, and production programs of the Commission." The division was to be "the medium for direct interpretation in the program of the Commission of the changing requirements of the military establishment with regard to atomic weapons."²

Although the Division of Military Application soon became the Commission's medium for the interpretation of military requirements, it never really was able to advise the Commission on the broad interrelations between military planning and atomic weapon production. Since the Commission could not gain access to the process of formulating military war plans, the division could not become a staff critic of military planning. Granted the division could advise the Commission about military needs during the dispute over weapon custody in the late 1940s. Yet without access to military planning the "line" activities of the division, which involved managing a complicated and highly complex technological operation -- the research, development, and production of nuclear weapons -- came to dominate the "staff" activities.³

In 1947 the Atomic Energy Commission inherited the bare essentials of a weapon production system. Conducting weapon research and development was the task of the Los Alamos Scientific Laboratory which was operated for the Commission by the University of California. Performing some weapon ordnance tasks was the Sandia branch of Los Alamos which had been established sixty miles south of the laboratory at Sandia (now Kirtland Air Force Base East) in Albuquerque, New Mexico. The Rock Island Arsenal, which produced mechanical and electrical bomb components, furnished the rudiments of a weapon production plant system. The Commission inherited no permanent weapon testing area. Despite post-war uncertainties Los Alamos had assembled a few weapons and parts since August 1945, but had not yet completely answered the question of whether nuclear weapons could be mass produced.⁴

Within two years the division had considerably modified this sparse picture by establishing the beginnings of an industrial organization to develop, test, and produce nuclear weapons. Most weapon development functions were removed from Los Alamos, allowing it to concentrate on research. In 1947 ordnance engineering was transferred to Sandia, which was considered a separate laboratory, after the contract was transferred from the University of California to Western Electric in 1949. For testing nuclear weapons the division established for the Commission at Enewetak Atoll in the Pacific a proving ground which was used for the Commission's first weapon test series in 1948. In the fall of 1947 the Y-12 plant at Oak Ridge began manufacturing weapon parts. By the end of the 1940s, the production of nuclear weapons was beginning to move out of the laboratory and into the pro-

duction plant.⁵

As the weapon program became organized, so did the Division of Military Application. By September 1948 the Division contained three branches which supervised weapon programs. The weapons branch controlled the development of nuclear weapons from initial research to stockpiling of the finished product. The radiological branch formulated and coordinated plans for the military use of radioactive materials. Finally, the power branch integrated military needs for power reactors into the Commission's reactor development program.

(See Appendix IV-1, page 19.)⁶

Full-Scale Weapon Program

In September 1949 nuclear weapons assumed a new importance when the first Russian atomic detonation was detected. At the direction of President Truman, the Commission began to develop thermonuclear weapons on a priority basis. Along with the thermonuclear quest was an increased emphasis on the development of fission weapons.⁷

By the mid-1950s the thermonuclear emergency, plus the divisional efforts begun in the late 1940s, resulted in the erection of an extensive industrial system for weapon research and development. In 1952 a second weapon research laboratory was established at Livermore, California. Plants for manufacturing weapon parts were established at Rocky Flats (1952), Kansas City (1952), Burlington, Iowa (1952), Mound Laboratory in Miamsburg, Ohio (1955), and Pinellas, Florida (1957). A weapon assembly plant was opened in Amarillo, Texas in 1952. In 1958 a Sandia weapon ordnance branch was added to the Livermore laboratory. The Livermore Sandia branch and each of the weapon production plants

were run for the Commission by an industrial contractor. Livermore was operated by an academic contractor, the University of California. Supervising the day-to-day contractor operations was the Santa Fe (later Albuquerque) Operations Office.⁸

Both experimental and completed weapons were tested at an increased tempo during the 1950s. In 1950 the division obtained for the Commission an additional weapon testing site at the Bombing and Gunnery Range outside Las Vegas, Nevada. Almost immediately Los Alamos put it to use, conducting the first continental test series in 1951. Thereafter until 1959, each year saw at least one weapon test series conducted either in Nevada or in the Pacific.⁹

As more weapons were produced and tested, the nation's nuclear stockpile grew. Control of the growing stockpile was gradually transferred from the Atomic Energy Commission and the Division of Military Application to the Department of Defense. Initially in 1951 a limited number of nonnuclear components were transferred to the Department of Defense. By 1952 complete weapons were being turned over to the military, and by 1956 most of the stockpile was in the physical, if not the formal, control of the military. Furthermore, as the stockpile grew, the number of nuclear weapons being transported and stored around the country increased. In order to be prepared for the remote possibility that a transit or storage accident might detonate the conventional explosive in a weapon, the Commission set up special teams trained and equipped to handle such an accident. The division assumed responsibility for these teams and drew up policies for safely transporting and storing nuclear weapons. In addition, the division insured that safety con-

siderations were incorporated into the design and development of new weapons.¹⁰

As the weapon production and testing system was being established, the division clarified its liaison activities with the Department of Defense in nuclear weapon development. On March 21, 1953 the Atomic Energy Commission and the Department of Defense signed an agreement defining their responsibilities in developing weapons. The division, for the Commission, was assigned responsibility for the development and production of weapons. The Department of Defense assumed responsibility for determining military characteristics, weapon suitability, and weapon acceptability. Since 1953 nuclear weapons have been developed and produced jointly under this agreement.¹¹

The Division of Military Application expanded with the weapon program. By the middle of the 1950s, the radiological and power branches had been abolished. Reflecting the expansion of the weapons production program, the division by 1956 contained a production and storage branch, a research and development branch, and a test branch, each of which supervised a major portion of the weapon production system. The production and storage branch, divided into nuclear, nonnuclear, and storage sections, oversaw the manufacture of nuclear weapons, their placement in the stockpile, and their transfer to the Department of Defense. The research and development branch supervised the research and development performed by Los Alamos, Livermore, and the two Sandias. The test branch managed weapon testing activities both in Nevada and in the Pacific. In addition to these "line" branches reflecting its increased administrative and management responsibilities, the division

contained the following "staff" branches -- administrative management, budget and financial administration, coordination and planning, and reports and information. (See Appendix IV-2, page 20.)¹²

A New Function

In 1958 the division gained a new function as a result of an amendment to the Atomic Energy Act which permitted freer exchange of weapon information with America's allies for mutual defense. Since the United States closest ally was the United Kingdom, the two nations quickly concluded a broad agreement which permitted the exchange of detailed atomic weapon information, nonnuclear weapon components, and certain weapon materials with the British. Within a year, more restricted mutual defense agreements were concluded with Canada, France, West Germany, Greece, The Netherlands, and Turkey. The Division of Military Application was given the responsibility of making an initial determination for the Commission as to what information or components could be given each nation and of monitoring jointly with the Department of Defense the information and parts which went overseas.¹³

Test Ban

Besides cooperation for mutual defense, other international activities had a major impact on Military Application functions and programs. In November 1958 the United States and the Soviet Union began negotiating a nuclear test ban treaty in Geneva, Switzerland. Although these talks collapsed in 1961, new discussions eventually resulted in a 1963 treaty banning nuclear weapon tests in the atmosphere, under water, or in outer space. Though the weapon construction and assembly plants could function as before, henceforth all weapon testing had to be con-

ducted underground (and was performed mostly in Nevada).¹⁴

The test ban negotiations had other, more immediate, impacts on the division. As the 1958-1961 negotiations proceeded, the ability to detect weapon tests underground and in outer space became a key factor in agreements being discussed. In response to this need the United States established a three-part program named Vela to improve capabilities to detect nuclear explosions. One part of the program was designed to improve capabilities to distinguish between earthquakes and nuclear explosions; another, to develop ground-based instruments for the detection of explosions in outer space; and a third, to establish satellite-based instruments for the detection of nuclear explosions in outer space. Although the Department of Defense directed the program, Military Application maintained close liaison with the Department and directed the Commission's technical activities in the program. Several underground test explosions, both nuclear and non-nuclear, were conducted by the Commission as part of the Vela program.¹⁵

To manage more efficiently increased responsibilities added by international developments and the expanded weapon production system, the division in a late 1961 reorganization added a new managerial official, the assistant director. Now six new assistant directors, rather than branch chiefs, oversaw the division's major functions. The assistant director for production and storage managed weapon production and safety programs; the assistant director for research and development, weapons research and development in the laboratories and the Vela programs; the assistant director for test, all testing activities; and the assistant director for plans and military cooperation,

the information exchange program with the United Kingdom and long-range divisional planning. Administrative, program review, and budget tasks were divided between the assistant director for administration and the assistant director for program analysis and budget. (See Appendix IV-3, page 21.)¹⁶

New Programs

After the 1963 negotiations resulted in a limited test ban treaty, President Kennedy ordered the Atomic Energy Commission to maintain the capability to resume testing in the atmosphere, under water, and in outer space if the need arose. Acting for the Commission, the Division of Military Application in conjunction with the Department of Defense, created programs to upgrade Pacific testing facilities, to keep diagnostic aircraft available, and to insure that the required nuclear and nonnuclear components were always kept on hand. By January 1, 1965 efforts on this task had progressed to the point that the United States was ready to resume testing in prohibited environments within a limited amount of time.¹⁷

During the 1960s Military Application developed several other new major programs. Originating at the Livermore Laboratory in 1957 was Project Plowshare. The objective of Plowshare was to use nuclear explosions for peaceful purposes, some possible applications of which were thought to be large-scale excavation projects, power production, isotope production, and the recovery of oils from shales, tar sands, or depleted wells. By 1960 the program consisted of both laboratory studies and field experiments and in 1961 the Commission conducted its initial Plowshare nuclear detonation in New Mexico. In 1961, however,

to emphasize the peaceful nature of Plowshare research, the Commission transferred Plowshare activities to an independent headquarters division, the Division of Peaceful Nuclear Explosives.¹⁸

Laser fusion was another new program of the 1960s. Beginning in 1962, laser fusion research investigated the ability of high-energy lasers to induce thermonuclear reactions in small deuterium-tritium pellets. Since laser fusion had weapons as well as power implications, research was confined to the weapon laboratories in the 1960s. By 1969 the concept merited increasing levels of funding and industrial emphasis, and by 1976 the requirements of managing a program of such increasing complexity required that a separate headquarters division, the Division of Laser Fusion, be established.¹⁹

Emerging from laser fusion research in the 1970s was interest in laser isotope separation. The purpose was to investigate the use of lasers to separate isotopes, especially isotopes of uranium. Research on laser isotope separation began in 1971 and by 1974 the program had grown sufficiently large to warrant a separate branch to manage it.²⁰

Transfers to ERDA and DOE

On October 11, 1974 President Gerald R. Ford signed the Energy Reorganization Act of 1974 which abolished the U. S. Atomic Energy Commission and assigned its operational functions to the newly created U. S. Energy Research and Development Administration. The act specifically transferred the Division of Military Application and its functions and programs to ERDA. The division became ERDA's liaison unit with the Department of Defense and ERDA's manager of the nuclear weapon manufacturing and testing system. The division also continued to administer

ERDA activities under mutual defense agreements.²¹ (See Appendix IV-5, page 23.)

Yet it was not certain whether the weapons program and, therefore, the division would remain a part of ERDA. Wishing to reexamine whether continued civilian control of the military atom was appropriate, Congress, in Section 307(b) of the Energy Reorganization Act of 1974, directed both ERDA and the Department of Defense to study the desirability and feasibility of transferring the division and other related classified nuclear activities either to the Defense Department or to another federal agency. A broad study of the question took a year to complete. The study concluded that the division and the entire nuclear weapon manufacturing system, as well as all other classified nuclear activities, should remain a part of ERDA. One of the reasons for leaving the system in a civilian energy agency was the unique capabilities of the weapon research laboratories, Los Alamos and Livermore, to perform nonnuclear energy research. In order to meet Congressional concerns about the difficulty of determining the impact of nuclear weapon requirements on the ERDA budget, the study recommended that both ERDA and the Department of Defense revise methods for submitting weapon program budgets to Congress.²²

In the spring of 1977, after its future had been determined, the division underwent a major reorganization. To improve the division's management of the weapon production system, weapon development, production, testing functions, and the initial stages of the weapon development cycle were consolidated under the assistant director for research, development, and testing. The remainder of the weapon development cycle, as well as weapon production, retirement, and disposal was to be super-

vised by a new organization, the Office of the Assistant Director for Operations. Management of weapon safety programs remained with the assistant director for safety, environment, and emergency actions. Long-range planning remained the function of the assistant director for planning. Administrative and budget functions were now divided between the assistant director for program support and the assistant director for financial management. (See Appendix IV-6, page 24.)²³

On August 4, 1977 President Jimmy Carter signed the Department of Energy Organization Act which abolished the Energy Research and Development Administration and transferred its functions to the newly created Department of Energy. Again a statute specifically transferred the Division of Military Application, soon to be renamed the Office of Military Application, to a new agency. Now the office would manage the weapons production system and its other related duties for a cabinet level department.²⁴ (See Appendix IV-7, page 25.)

RECORDS OF THE OFFICE OF MILITARY APPLICATION

The Historian's Office has accessioned thirty-five cubic feet of historical records from the Office of Military Application for retention in the Department of Energy Archives. The records are organized in two groups, Jobs 1178 and 1179, and are stored in vaults at DOE's Germantown facility. Within each group the files are arranged by a subject numeric filing system.

The Military Application records fall into two major subject areas: weapons test series files and weapon development files. The test series files are arranged by individual test series and contain information which the division needed for the planning and execution of the series. The archives has files on all testing done between 1948 and 1958 and some materials on the underground testing done in the 1960s. The weapon development files are organized by specific weapons and contain data which the division needed to move a weapon from initial conception to the stockpile. The archives holds a file for most weapons entering the stockpile in the 1950s.

One interesting subgroup of Military Application records are the weapon test films. During most of the test series conducted in the 1950s, one or more films were made. These films describe, in rich technological detail, the advances which were hoped for, and which were actually made, at each test series. The films depict weapon development in a manner in which no printed page can.

Most of the materials are highly classified and authorization for access must be obtained from the Chief Historian and the Director of Military Application.

The best source of information on the organization and programs of the Office of Military Application is the official files of the U. S. Atomic Energy Commission which are also retained by the Historian's Office.

DIRECTORS OF THE DIVISION OF MILITARY APPLICATION

Brig. General James McCormack, Jr., USAF	February 1, 1947- August 19, 1951
Brig. General Kenneth E. Fields, USA	August 20, 1951- April 30, 1955
Maj. General Alfred D. Starbird, USA	July 1, 1955- January 25, 1961
Maj. General Austin W. Betts, USA	January 26, 1961- February 14, 1964
Brig. General Delmar L. Crowson, USAF	February 17, 1964- June 30, 1967
Maj. General Edward B. Giller, USAF* +	July 1, 1967- June 30, 1972
Maj. General Frank A. Camm, USA*	July 1, 1972- November 23, 1973
Maj. General Ernest Graves, USA*	December 15, 1973- September 21, 1975
Maj. General Joseph K. Bratton, USA	September 22, 1975- August 17, 1979
Maj. General William W. Hoover, USAF	September 13, 1979-

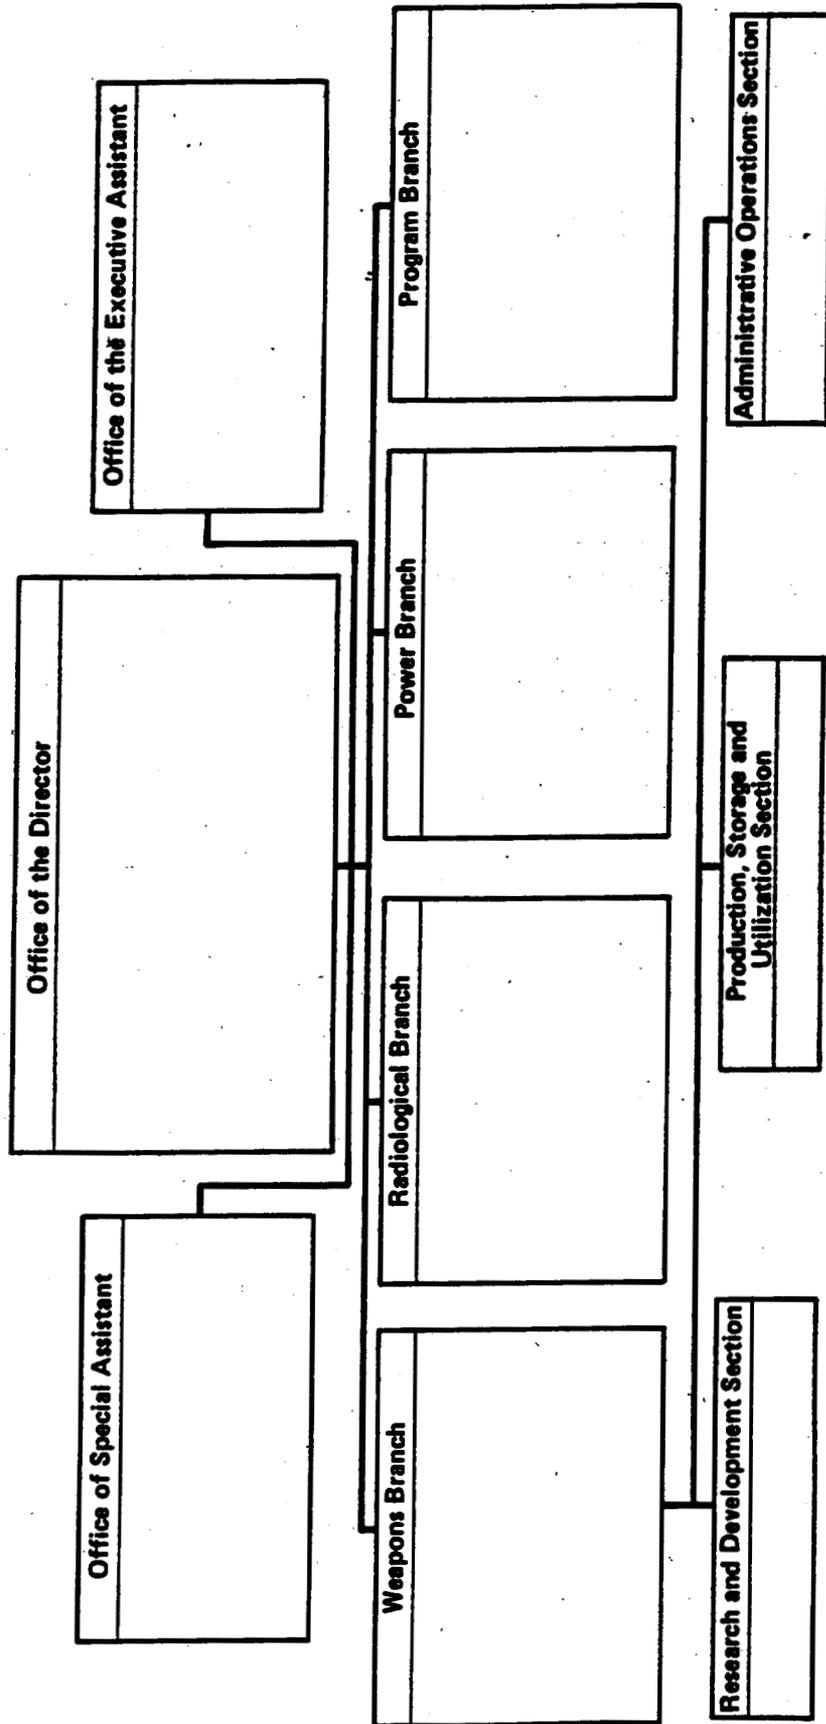

*Also held the title of Assistant General Manager for Military Application while serving as division director.

*Also held the title of Assistant General Manager for National Security while serving as division director.

CHRONOLOGY

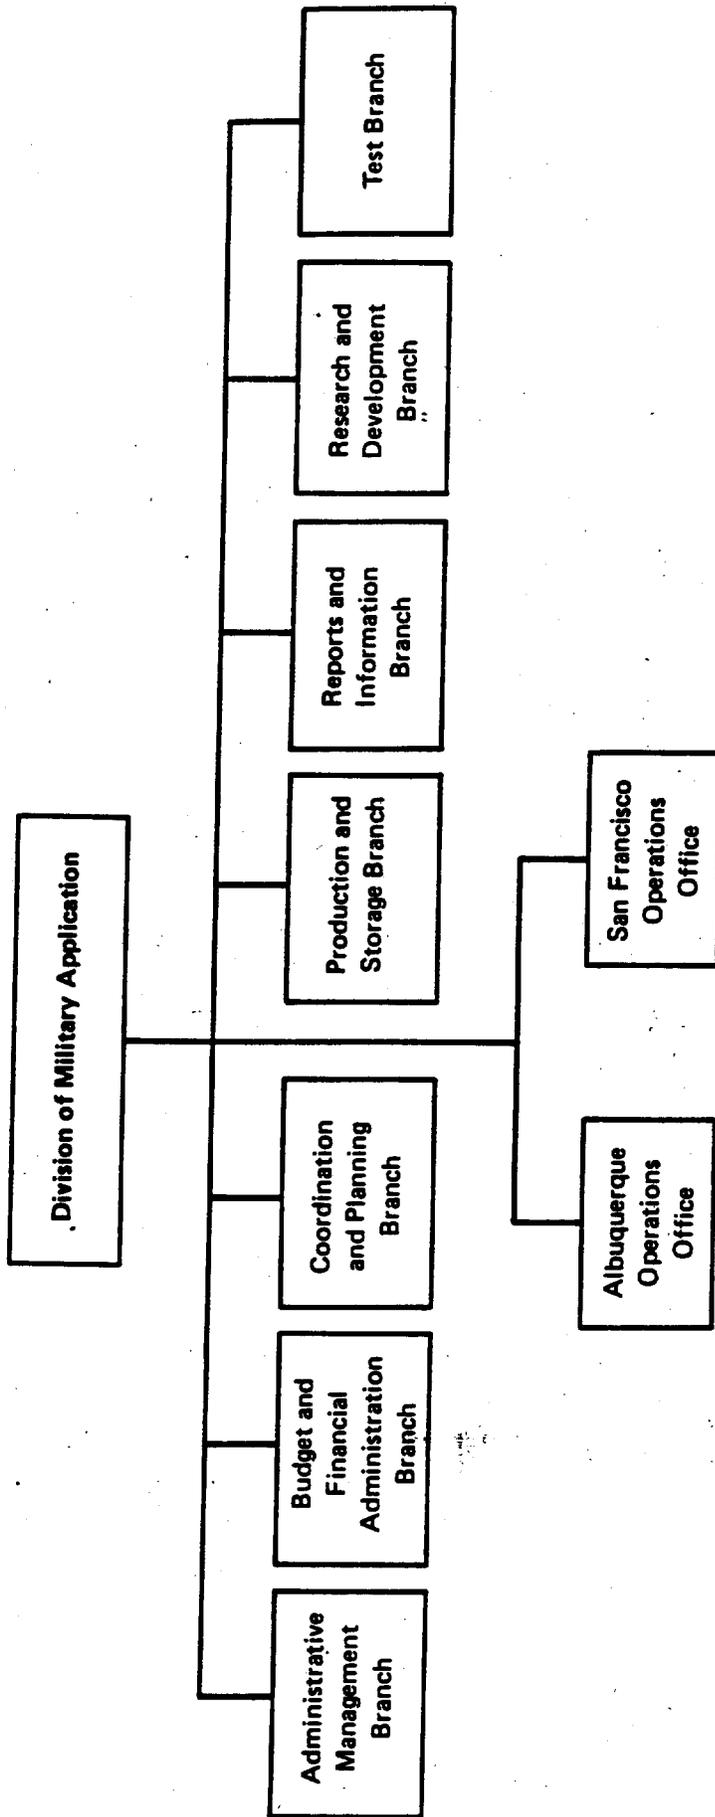

<u>DATE</u>	<u>EVENT</u>
August 13, 1942	Manhattan Engineer District created.
March 15, 1943	Los Alamos established.
August 6, 1945	Bombing of Hiroshima.
August 1, 1946	Atomic Energy Act signed.
January 1, 1947	U. S. Atomic Energy Commission takes over atomic energy programs.
April-May 1948	<u>Sandstone</u> Test Series.
September 23, 1949	President Truman announces detection of first Soviet nuclear detonation.
January 31, 1950	President Truman announces his decision to accelerate thermonuclear weapon development.
January 27, 1951	First continental test series conducted at Nevada begins.
November 1, 1952	<u>Ivy-Mike</u> shot.
March 1, 1954	<u>Castle-Bravo</u> shot.
February, 1957	First <u>Plowshare</u> symposium held at Livermore.
September, 1958	Libby-Cockcroft agreement allowing closer U.S.-U.K. cooperation for mutual defense signed.
November, 1958	U.S.-U.S.S.R. test ban negotiations begin in Geneva
December, 1961	First <u>Plowshare</u> nuclear detonation conducted near Carlsbad, New Mexico.
October 7, 1963	U. S. ratified limited test ban treaty.
October 11, 1974	President Ford signs legislation dissolving the Atomic Energy Commission and creating the Energy Research and Development Administration.
October 1, 1977	Energy Research and Development Administration dissolved; Department of Energy created.
