# 1. EXECUTIVE SUMMARY

The Environmental Protection Department/ Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During third quarter 1992, EPD/EMS conducted extensive sampling of monitoring wells.

EPD/EMS has established two sets of flagging criteria to assist in managing sample results. The flagging criteria do not define contamination levels; instead, they aid personnel in sample scheduling, interpretation of data, and trend identification. Since 1991, the flagging criteria have been based on the federal Environmental Protection Agency (EPA) drinking water standards and on method detection limits. A detailed explanation of the flagging criteria is presented in the **Flagging Criteria** section of this document. Analytical results from third quarter 1992 are included in this report, which is distributed to all site custodians. Thirteen wells scheduled for analyses during third quarter 1992 were not sampled pending full establishment of a purgewater containment program. For more information, see the **Sample Scheduling** section.

One or more analytes exceeded Flag 2 during third quarter 1992 in 103 monitoring well series. Analytes exceeded the current Flag 2 criteria for the first time since 1984 in 21 of the 103 monitoring well series, two of which (FSL and HSL) were first sampled this quarter.

Table 1 lists those well series with constituents in the groundwater above Flag 2 during third quarter 1992, organized by location. Results from all laboratory analyses are used to generate this table. Specific conductance and pH data from the field also are included in this table.

## NOTES

# 2. INTRODUCTION

This report summarizes the Savannah River Site (SRS) groundwater monitoring program conducted by the Environmental Protection Department's Environmental Monitoring Section (EPD/EMS) during the third quarter of 1992. It includes the analytical data, field data, data review, quality control, and other documentation for this program; provides a record of the program's activities; and serves as an official document of the analytical results.

EPD/EMS is responsible for monitoring for constituents in the groundwater at approximately 135 waste sites in 16 areas at SRS (see Figures 1 and 2, pp. 14–15). The majority of this monitoring is required by U.S. Department of Energy (DOE) orders and by federal and state regulations administered by the U.S. Environmental Protection Agency (EPA) and the South Carolina Department of Health and Environmental Control (SCDHEC). The groundwater monitoring program includes the following activities:

- installation, maintenance, and abandonment of monitoring wells
- environmental soil borings
- development of sampling and analytical schedules
- collection and analyses of groundwater samples
- review of analytical and other data
- maintenance of the databases containing groundwater monitoring data
- quality assurance (QA) evaluations of laboratory performance
- reports of results to waste-site facility custodians and the Environmental Protection Section (EPS) of EPD

EPD/EMS is responsible for monitoring wells but not for the facilities that are monitored. It is the responsibility of the custodian of each waste site to ensure that EPD/EMS is informed of sampling requirements and special requests for the sampling schedule, to assist in reviewing the data, and to make any decisions regarding groundwater monitoring at the waste site.

Each custodian receives a copy of this report; also, each custodian receives site-specific data upon request, including the following:

- a computer printout of the analytical data for the current quarter and for the previous seven quarters, designed to assist in identifying trends
- a computer printout of analytical values at or above Flag 1 and Flag 2 criteria for the quarter, designed to assist in identifying elevated analytical values

## ORGANIZATION OF THIS REPORT

This report is divided into sections that focus on specific aspects of the SRS groundwater monitoring program. The **Executive Summary** section presents a tabular listing by waste site and well series of all analytes detected at or above Flag 2 criteria during the quarter. Analytes detected at or above Flag 2 criteria for the first time since 1984 are indicated in bold type.

The following five sections address sampling and assessment of groundwater quality at SRS.

The **Flagging Criteria** section lists flagging criteria for analytes and provides a short description of how the criteria were derived. The **Sample Scheduling** section discusses the preparation of the sampling schedule and the criteria for analyte selection.

During sample collection, samplers often write comments in the field logbooks that may be pertinent to the analysis of the sample. Many of the comments concern wells that went dry during sampling or the appearance of water that is colored, turbid, or aerated. These comments are given in the **Field Notes** section.

Samples are analyzed by the EPD/EMS and M-Area laboratories at SRS and by one or more off-site laboratories. During the third quarter, General Engineering Laboratories and Roy F. Weston, Inc., were the primary off-site laboratories; radionuclide analyses were conducted by Environmental Physics (a division of General Engineering Laboratories), Teledyne Isotopes, Clemson Technical Center, Inc., and TMA/-Eberline; asbestos analyses were conducted by Spencer Laboratories. The **Analytical Data Review** section contains two subsections. The **Review of the Analytical Data for Errors** subsection is a discussion of discrepancies in each laboratory's analytical data, including results that are considerably higher or lower than previous results, analyses that were omitted, and laboratory blanks that showed elevated results. The **Analytical Methods** subsection lists the methods the laboratories used for measuring concentrations of each analyte.

A number of replicate samples are analyzed by the primary off-site laboratories as part of the EPD/EMS quality control program. The **Quality Control Samples** section contains four subsections. The **Replicate and Duplicate Analyses of Samples** subsection explains the replicate analysis program, gives the statistical methods used for comparison, and lists the results of the comparisons. The **Comments on the Replicate and Duplicate Analyses** subsection discusses the replicate and duplicate analyses comparison results and their meanings. The laboratory's performance is tested using solutions with known analyte concentrations; the results and percentage of analyses within limits are found in the **Quality Control Standards** subsection.

The **Blanks** subsection discusses various types of sampling blanks and lists anomalous results obtained from analysis of samples of deionized water to aid in determining if detected constituents were in rinsewater, in sample containers, or introduced during analysis.

The **Water Level Data** section includes concurrent water elevations obtained in the A/M and other areas; these data are used by SRS personnel in hydrogeologic studies.

The **Site Index by Well Series** assists the reader in identifying the site associated with each well series. A list of terms, abbreviations, and acronyms used in this report can be found in the **Glossary** section. References cited are listed in the **References** section.

The **Analytical Results** section (**Appendix A**) includes tables listing the analytical results from all the laboratories and field data for all wells sampled during the quarter. The tables appear in alphabetical order by well name. **Appendix B** contains tables listing the analytical results of laboratory tests on sampling blanks.

## FOR FURTHER INFORMATION

The following is a brief description of documents pertaining to the groundwater monitoring program.

### Quarterly Reports

EPD/EMS has published a description of its groundwater monitoring program for each quarter since the beginning of 1986. A list of these quarterly reports follows.

### Annual Reports

DOE's *Savannah River Site Environmental Report*, which includes groundwater data for the year, site descriptions, and site maps, is a public document issued annually. A list of recent reports follows.

| Report | Document Number |
|---|---|
| 1991 | WSRC-TR-92-186 |
| 1990 | WSRC-IM-91-28 (Vols. I and II) |
| 1989 | WSRC-IM-90-60 (Vols. I and II) |
| 1988 | WSRC-RP-89-59-1 (Vols. I and II) |
| 1987 | DPSPU-88-30-1 (Vols. I and II) |
| 1986 | DPSPU-87-30-1 (Vols. I and II) |
| 1985 | DPSPU-86-30-1 (Vols. I and II) |

### Inventory and Maps of Wells

The *Environmental Protection Department's Well Inventory* provides a historical record of wells monitored by EPD/EMS, contains a list of wells currently in the EPD/EMS Groundwater Monitoring Program, and provides pertinent information about all wells listed in EPD/EMS documents. The latest version is ESH-EMS-920039, which includes site maps for active and abandoned wells.

Prior to 1991, information on well abandonment, maintenance, construction and stabilization, environmental soil borings, and surveying was included in the quarterly report. All of that information now is published separately in The Savannah River Site's Groundwater Monitoring Program annual *Well Installation Report*. The current version is ESH-EMS-910093.

### Other Data Reports

DOE's *Geoscience Implementation Plan* and *Geohydrology Program Report* describe SRS geohydrology program projects and their current status and administration.

Christensen and Gordon's *Technical Summary of Groundwater Quality Protection Program at Savannah River Plant, Volume I – Site Geohydrology, and Solid and Hazardous Wastes,* (DPST-83-829, December 1983) describes SRS waste disposal sites and analytical monitoring data.

Stone and Christensen's *Technical Summary of Groundwater Quality Protection Program at Savannah River Plant, Volume II – Radioactive Waste* (DPST-83-829, December 1983) presents representative monitoring data for radioactivity in groundwater at SRS.

Full bibliographical listings of these and other documents cited can be found in the **References** section of this report.

## NOTES

# 3. FLAGGING CRITERIA

Analyses in the data tables are assigned a flagging level (0, 1, or 2) depending on their concentration in a groundwater sample. Beginning in 1991, EPD/EMS modified its guidelines for setting flagging levels for the Groundwater Monitoring Program. The flagging criteria in Table 2 were determined as follows.

*Flag 0*: Analytical results below Flag 1 or for a constituent having no flagging criteria are classified as Flag 0.

*Flag 1*: The Flag 1 criterion for a constituent was set as one-half of the Environmental Protection Agency (EPA) final primary drinking water standard, the EPA proposed primary drinking water standard, or the EPA secondary drinking water standard for that constituent. If a constituent did not have an EPA drinking water standard, the Flag 1 criterion was set as five times a recently published 90th percentile detection limit obtained by one of the primary laboratories.

*Flag 2*: The Flag 2 criterion for a constituent was set as the EPA final primary drinking water standard, the EPA proposed primary drinking water standard, or the EPA secondary drinking water standard for that constituent. If a constituent does not have a drinking water standard, the Flag 2 criterion was set as 10 times a recently published 90th percentile detection limit obtained by one of the primary laboratories.

The following major cations, aesthetic analyses, and indicator parameters are not assigned flagging criteria: alkalinity, calcium, color, corrosivity, magnesium, odor, potassium, silica, sodium, total dissolved solids, total phosphorus, total phosphates (as P), and turbidity.

Common laboratory contaminants and cleaners, including ketones, dichloromethane (methylene chloride), and phthalates, are not assigned flagging criteria.

The following acronyms are used as abbreviated sources in the flagging criteria table. Complete information concerning documents cited can be found in the **References** section of this document.

APHA Method—A specific analytical method for testing constituent levels in a sample as established by the American Public Health Association, American Water Works Association, and Water Pollution Control Federation. See American Public Health Association et al. in **References.**

DWS—Drinking Water Standards.

EPA—Environmental Protection Agency.

EPA Method—A specific analytical method for testing constituent levels. Descriptions of these methods may be found in the EPA publications *Methods for Chemical Analysis of Water and Wastes* and *Test Methods for Evaluating Solid Waste*, and in the *Code of Federal Regulations*, Title 40, Part 136. # 4. SAMPLE SCHEDULING

Scheduling of sampling and analyses for the SRS Groundwater Monitoring Program conducted by EPD/EMS is determined by several factors. Comprehensive analyses (see Table 4) are scheduled on a regular basis. Additional scheduling is based on previous flagging levels, regulatory requirements, and special requests that fall within the scope of the Groundwater Monitoring Program. All this information was used to generate *The Savannah River Site's Groundwater Monitoring Program 1992 Sampling Schedule.*

A breakdown by laboratory of the total number of analyses performed for third quarter 1992 is shown in Table 3.

**Table 3. Number of Analyses Performed During Third Quarter 1992**

## COMPREHENSIVE ANALYSES

New wells are scheduled initially for four quarters of comprehensive analyses, except that the herbicide/pesticide suite is scheduled only during the first of the four quarters. Comprehensive analyses include indicator parameters, groundwater quality characteristics, and some drinking water characteristics. After the initial four quarters of analyses for new wells, comprehensive analyses including herbicides/pesticides are scheduled once every two years. Wells sampled exclusively for radionuclide analyses are not included in these biennial comprehensive analyses.

# SAMPLE SCHEDULING

### Scheduling Based on Flagging Levels

Beginning first quarter 1992, only the flagging criteria for comprehensive and herbicide/pesticide analyses are used to trigger scheduling. Wells are grouped for scheduling by the monitoring site or by the investigation for which they are sampled. Specific criteria for Flag 1 and Flag 2 designations are found in the **Flagging Criteria** section of this report.

Constituents classified as Flag 0 in each well series are scheduled for analyses only by custodian request or as part of the biennial comprehensive analysis program. If an analytical result for a constituent of comprehensive analyses in any well exceeds Flag 1, all wells in the same scheduling series are sampled and analyzed for that constituent once a year. If a constituent falls below Flag 1 for three consecutive sampling episodes, the individual well's flag is reduced from Flag 1 status to Flag 0 status and the flagging-based sampling ceases.

If an analytical result for a comprehensive-analyses constituent exceeds Flag 2, all wells in the same scheduling series are sampled and analyzed for that constituent twice a year. If a constituent falls below Flag 2 for three consecutive sampling episodes, the individual well's flag is reduced from Flag 2 status to Flag 1 or Flag 0 status, depending on the results, and the well is scheduled according to the lower flag.

If a comprehensive-analyses constituent has ever been flagged in a well series, it is automatically flagged for all new wells of that series. For removal from a new well, a constituent's flag must follow the rules referred to earlier.

The following constituents, although included in comprehensive analyses, do not receive flagging-based scheduling:

- Two indicator constituents, specific conductance and pH, have flagging criteria but do not trigger the scheduling mechanism.
- No flags are set for the following indicator parameters and major cations: sodium, total dissolved solids, potassium, calcium, magnesium, silica, total phosphates (as P), and alkalinity (a field measurement).

When one of the six constituents of the herbicide/pesticide suite of comprehensives is flagged, the entire suite is flagged for analyses.

### GCMS VOA ANALYSES

Twice a year all total organic halogens (TOH) are reviewed. GCMS VOA analysis is scheduled once for individual wells that have had two results for TOH greater than 10 $\mu$g/L (excluding the first TOH analysis) and have never received GCMS VOA analysis.

### SAMPLING REQUESTS

Many analyses are scheduled at the request of various SRS groups. The person or group requesting the analyses must submit a formal sampling request form to EPD/EMS. If the request is within the scope of the groundwater monitoring program, and if provision for the analyses has been made in the current laboratory contract, the analyses are added to the sampling schedule. Likewise, if a sampling request needs to be deleted, the originator of the request must submit a deletion form.

### Regulatory Requirements

All regulatory sampling requirements, such as those for the Resource Conservation and Recovery Act (RCRA), are scheduled by request.

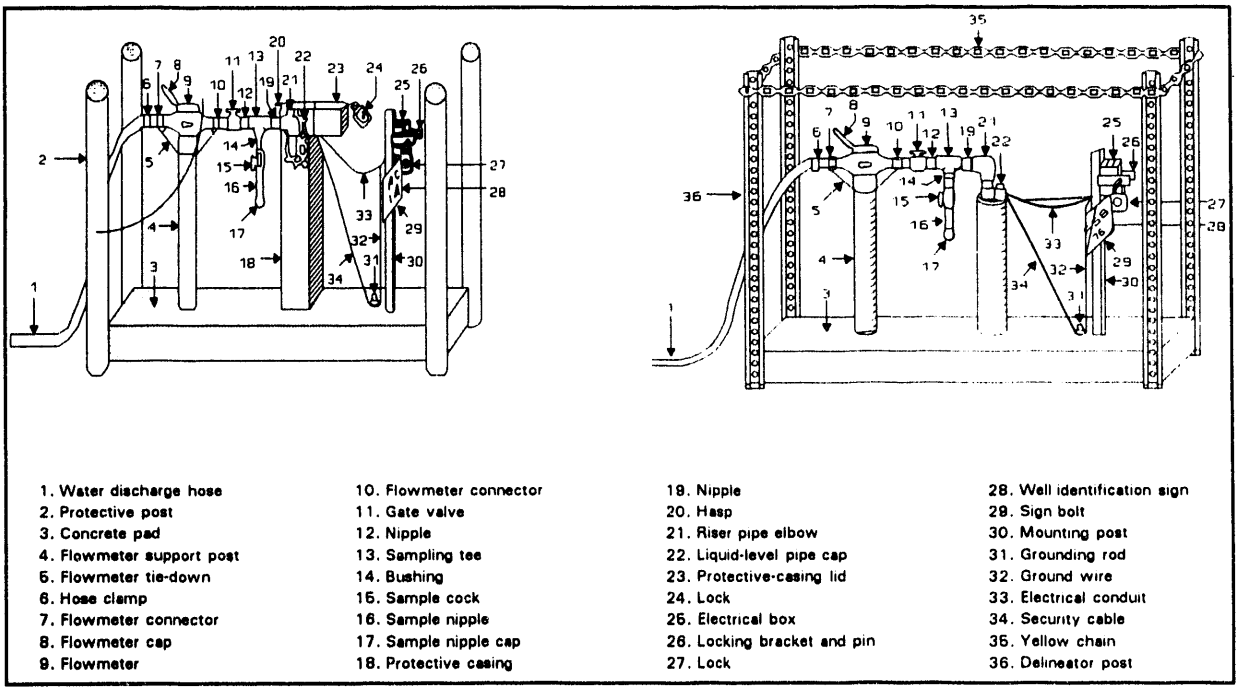
### PURGE-WATER CONTAINMENT PROGRAM

Beginning in 1991, a purge-water containment program was partially implemented to containerize and properly dispose of the water purged from certain wells before sampling. However, pending full implementation of this program, the following wells that had been scheduled for analyses as part of the groundwater monitoring program during third quarter were not sampled:

| | |
|---|---|
| BGO 26A | LFW 7 |
| BGO 37C | P 28TC |
| CRP 1 | TBG 3 |
| CRP 3 | TBG 4 |
| CSB 2A | TBG 5 |
| CSB 6A | TBG 6 |
| DCB 1A | |

Only water level measurements were taken from the above wells.

## NOTES



# 5. FIELD NOTES

Sample collection and field data measurements were performed by EPD/EMS personnel and Ge-Hy Environmental Sampling of New Ellenton, SC.

Each sampler maintained a field notebook. These notebooks are located in the third quarter 1992 section of the EPD/EMS Groundwater Monitoring Library. Field measurements may include alkalinity, pH, temperature, specific conductance, air temperature, depth to the water prior to pumping, and volume of water purged prior to sampling.

All well visitations were routine during third quarter 1992 except as indicated in Table 5. The samplers' observations about water samples, well conditions, and any special collection methods are noted in the table. All wells were pumped except for those from the following series, which were bailed: the F series; the FAC series except FAC 4; the FCA series except FCA 19D; the H series; the SSS series except SSS 20. The following individual wells also were bailed, although the other wells in the series were pumped: BG 121; CSD 1D; IDP 3D and 4; IDQ 1; K 301P; MSB 15C, 16C, 17C, 44C, and 46C; SCA 3A and 4A; TBG 5D; and ZBG 1A.

Among Z series wells, only wells Z 3 and Z 9 have casings large enough to allow sampling. Well Z 3 has a bailer stuck in it. All other Z wells have very narrow casings (~ 3/4 in.), making bailing impractical. Even if any Z wells other than Z 9 are scheduled, they are not sampled and water elevation measurements are not taken.

# FIELD NOTES

If a well runs dry during purging before a sample is collected and the well is revisited and sampled within 24 hours, this is considered one sampling event, yielding a single set of field and analytical data. For such wells, the volume purged before the well went dry during the first visitation is given in this section. The total amount of water purged from each well in one sampling event is given in the **Analytical Results** section.

Comments about dry wells, continuously pumping wells, and malfunctioning wells can be found in the **Analytical Results** section.

# NOTES

# 6. ANALYTICAL-DATA REVIEW

Sample analyses performed for EPD/EMS during third quarter 1992 were conducted by EPA methods, except as noted in Tables 21 and 22 on pages 60–69.

General Engineering Laboratories (GE) of Charleston, SC, and Roy F. Weston, Inc. (Weston or WA), of Lionville, PA, the primary contracting laboratories for sample analysis, performed all analyses, with the following exceptions:

- The EPD/EMS Laboratory (EM Lab or EM) at SRS conducted total-activity analyses of samples for shipping clearance. The EM Lab also conducted gross alpha, nonvolatile beta, tritium, and selected radionuclide analyses of samples from specified well series.

- Environmental Physics (GP) and Clemson Technical Center, Inc. (Clemson TC or CN) had radionuclide contracts; Teledyne Isotopes (Teledyne or TE) subcontracted radionuclide analyses for Environmental Physics; and TMA/Eberline (TM) subcontracted radionuclide analyses for Weston.

## REVIEW OF THE ANALYTICAL DATA FOR ERRORS

Exceeded holding time is indicated by a notation of *Q* in the analytical-results tables. See page A-2 for further information.

EPD/EMS reviews analytical data from the laboratories for errors and unusual results before entering this information into the database. All suspect data are brought to the attention of the laboratories for review, corrections, and comments.

Typical errors corrected for entry into the database include incorrect sample dates, run dates, and sample identifications; incorrectly entered analytical units, methods, and corresponding detection limits; incorrect dilution factor calculations; and analytical-data entry errors.

Analytical results that appear different from historical data collected since 1988 are brought to the attention of the appropriate laboratory. Thus, the laboratory is able to identify problems with some of these analyses, including incorrect dilution factor calculations and data entry errors. EPD/EMS corrects data files after receiving written notification from the laboratory.

Specific details concerning the corrections are entered in the *EMS Groundwater Monitoring Program Changes to the Database Logbook*, where the corrections are recorded.

### Review of GE's Analytical Data

Some of GE's results for laboratory blanks are qualified with *J1* because of problems associated with the blank itself or with the batch that the blank is in. For example, acids and base/neutrals may have a *J1* modifier if any surrogates failed. For metals analyses exhibiting surrogate failure, GE flagged *J1* those samples with results above detection limit and *J2* those samples with results below detection limit instead of using the numeric qualifier to indicate the direction of bias; see page A-2. Surrogate failure is not accounted for individually in letters accompanying data from GE.

In the past, GE has omitted *V* qualifiers from certain GCMS volatiles results because of insufficient space in the data record for all applicable qualifiers. In the future, *V* qualifiers will be applied with priority over numerical qualifiers.

The tetrachloroethylene and trichlororethylene results from well BRR 1D are suspect because of the possibility of carryover from the previous sample; the sample was not reanalyzed because holding time had expired.

Matrix interferences appear to be responsible for low selenium-spike recoveries for the following wells:

| FSB 89C | HSB 65C | HSB 85B | MSB 14B | |

Some, but not all, of the results are flagged with J1 in Appendix A.

Matrix interferences also caused unusually low spike recoveries for the following analyses: antimony for FSB113A and HSB 86B; lead for BG 67 and DCB 11; sulfate for FSB 97D; and thallium for FSB 91D. The spike recovery for sulfate for DCB 12 was unusually high, also because of matrix interference.

GE found no errors upon reviewing the records of the following laboratory blanks having elevated results. Well samples analyzed in the same batches are listed in Table 6.

GE found no errors upon reviewing the records of the EPD/EMS blind blanks having elevated results. All five of the trip blanks for total inorganic carbon showed elevated results (above 5,000 µg/L). This parameter is calculated as the difference between analytical results for total carbon and total organic carbon. The blanks for those analyses were not elevated. Table 7 lists the groundwater samples from the same analytical batches as the elevated blanks for other analyses.

| MSB 15C | Chloride, cyanide, pH, specific conductance, sulfate, gross alpha, nonvolatile beta, total alpha-emitting radium | Insufficient water for complete sample collection |
| MSB 81B | GCMS VOA | Laboratory error (3 of 4 vials were broken; the fourth didn't yield any results) |
| RCP 1A | All scheduled analyses | Chain of custody says "unable to sample due to slow (beginning) pump rate" |
| RWM 1, RWM 12 | All scheduled analyses except GC VOA | Samplers did not receive chains of custody |

### Review of the Environmental Physics Data

A technical review of the quarter's analytical data identified at least one result of the Environmental Physics analyses in Table 11 as high in comparison with historical data. A review of the laboratory records did not reveal any problems with the analyses. Analyses subcontracted to Teledyne also are included in this section.

| RCP 1A | All scheduled analyses | There is insufficient information in field log to determine reason |
| RWM 1 | Uranium isotopes by alpha spectroscopy | Samplers did not receive chains of custody |

### Review of the Weston Analytical Data

Weston subcontracted radionuclide analyses to TMA/Eberline. The results from these analyses are discussed in this section.

In narratives accompanying data, Weston provided detailed information on quality control analyses that were outside of guidance or control limits. These included a number of matrix spike recoveries for metals and blank spike recoveries for semivolatiles; nitrate calibration verification checks; and surrogate recoveries for semivolatiles and GCMS volatiles. Weston also specified a number of samples for which the relative percent difference between duplicate results for various metals is greater than 20%. These results are not consistently qualified in the analytical-results tables.

The presence of lindane in samples LFW 10A and LFW 21A was not positively confirmed on a second chromatographic column because of an interference; its presence, though reported, is questionable.

Because of elevated levels of total dissolved solids, the replicate from well ZDT 2 has a very high percent error for tritium. Samples from well BGO 50D analyzed for gross alpha, non-volatile beta, total radium, and tritium also contained high levels of total dissolved solids, as did samples from well RAC 1 for gross alpha.

The analytical modifier *V* was to be used, beginning fourth quarter 1991, to flag sample results associated with internal laboratory blanks having elevated results. (See p. A-2.) This modifier has been used inconsistently.

During third quarter, Weston qualified a few instances of laboratory blanks containing levels of silica, nitrate, and total organic halogens above the contract-specified detection limit. In

most of these, the sample result was many times greater than the blank result. However, positive metals analyses associated with elevated blanks sometimes were flagged with *J3* if the concentration in the sample was above detection limit but less than five times the concentration found in the blank. Table 13 associates well samples with specific blanks having elevated results, without regard to the modifiers used in Appendix A.

Table 17 lists scheduled analyses that were not performed by Weston or its subcontractor, along with the reasons. The two primary laboratories (GE and Weston) differ in their analytical suite assignments for certain constituents. When samples are sent to Weston only as splits or blind replicates, no adjustments are made for these differences in suites. Thus, some analytes may not be analyzed by both laboratories. These analytes are not presented in Table 17. See the **Sample Scheduling**, **Field Notes**, and **Analytical Results** sections of this report for more information on wells scheduled but not sampled this quarter.

### Review of the Clemson TC Analytical Data

Clemson TC performed some of the radionuclide analyses during third quarter. The laboratory noted that samples from wells LFW 21 and LFW 22 contained high levels of dissolved solids that interfered with the gross alpha and non-volatile beta analyses, causing elevated detection limits. The laboratory reported no problems when asked to review its records of the analyses listed in Tables 18 and 19, in which the analytical results were high or low, respectively, as compared to historical data.

**Table 18. Clemson TC Samples with High Analytical Results as Compared to Historical Data**

| Analyte | Wells |
|---|---|
| Gross alpha | FAC 5, LFW 26, LFW 30, LFW 32, LFW 37, PAC 3, PAC 6 |
| Nonvolatile beta | CMP 9B, CMP 10, FAC 5, FSS 3D†, LFW 26, LFW 30, LFW 47C, LFW 48C |

† The questioned value is at least 10 times higher than historical data. Because holding time had not been exceeded, the laboratory was asked to reanalyze the sample. However, insufficient sample remained to perform the reanalysis.
* The questioned values are at least 10 times higher or lower than historical data. Because holding time had not been exceeded, the laboratory was asked to reanalyze the sample. Both the original and reanalysis results appear in the results tables.

* The questioned values are at least 10 times higher or lower than historical data. Because holding time had not been exceeded, the laboratory was asked to reanalyze the sample. Both the original and reanalysis results appear in the results tables.

Clemson TC did not perform the scheduled analyses (gross alpha, nonvolatile beta, radium-226, radium-228, and tritium) on samples from wells SSS 11, SSS 12, SSS 20, and SSS 21 because the wells produced insufficient water.

### Review of the EM Lab Radioactive Analytical Data

A technical review of the quarter's analytical data from the EM Lab identified the total activity result for BG 55 as low in comparison with historical data and the results for analyses in Table 20 as high in comparison with historical data.

# ANALYTICAL-DATA REVIEW

## ANALYTICAL METHODS

GE and Weston performed most of the analyses conducted during third quarter, using the methods listed in Table 21.

Spencer Testing Services, Inc. (SP), conducted analyses for asbestos by electron microscopy, with a detection limit of 0.15 million structures per liter (MSL).

The EM Lab at SRS conducted selected radionuclide analyses of samples required by the groundwater monitoring program. The gross alpha and nonvolatile beta analytical methods used by the EM Lab are in-house and based on applicable EPA methods. Methods used by EPD/EMS for testing other radioisotopes also are in-house analytical methods. The EM Lab radioactivity determinations are reported as the absolute concentrations calculated from the analytical tests.

Environmental Physics, Teledyne, TMA/Eberline, and Clemson TC performed the radionuclide analyses. Their methods and detection limits, including in-house methods based on applicable EPA and DOE procedures, are listed in Table 22.

If the laboratories used more than one analytical method for an analyte, the methods are listed in the tables in descending order according to frequency of use. Generally, the method listed first was used for at least half of the analyses.

# NOTES

# 7. QUALITY CONTROL SAMPLES

## REPLICATE AND DUPLICATE ANALYSES OF SAMPLES

Blind replicate and duplicate samples are analyzed by the primary laboratories, General Engineering (GE) and Roy F. Weston, Inc. (Weston or WA), in order to satisfy quality assurance standards. The replicate and duplicate analytical results are used to generate Mean Relative Difference (MRD) indexes, which are used to evaluate a laboratory's performance.

For intralaboratory comparisons, 10% of the samples generally are analyzed in duplicate. In addition, EPD/EMS sends blind replicates of approximately 5% of the total samples to the laboratories for analysis. The results of the blind replicate analyses are used for both intralaboratory and interlaboratory comparisons.

All of these results are included in the **Analytical Results** section of this report. Results from duplicate samples are included in the main table for a given well and sample date. Results from analyses of replicate samples and from any duplicate analyses made on the replicates are reported in a second table for the same well and sample date.

Table 23 lists the names and sample dates of wells used as blind replicates for GE and Weston.

Certain analytes were not present in concentrations above detection limits in any well samples having replicates or duplicates. These analytes are not considered in further evaluation of replicate and duplicate analyses. They are listed in Table 24. See Tables 21 and 22 on pages 60–69 for the detection limits that are effective this quarter.

## Intralaboratory Comparisons

There are two types of intralaboratory comparisons: in-house duplicates and blind replicates. The mean relative difference (MRD) was developed by EPD/EMS personnel to assess the reproducibility of identical chemical analyses. For both intralaboratory comparisons, the MRD is defined as the average absolute difference between an original sample and its duplicate or blind replicate, expressed as a percentage of the mean of those two values. It is calculated as

- No replicate or duplicate analyses performed.

$$MRD = \left\{ \frac{\sum_{i=1}^{n} \left( |x_i - y_i| \,/\, [(x_i + y_i)/2] \right)}{n} \right\} \times 100,$$

where

$x_i$ = an analyte's mean concentration in a water sample for the $i^{th}$ well,
$y_i$ = the analyte's mean concentration in the replicate or duplicate, and
$n$ = the number of pairs of observations.

For the in-house duplicate comparisons, the quantities $x_i$ and $y_i$ represent the results for the original sample and the in-house duplicate, respectively. For the blind replicate comparisons, $x_i$ and $y_i$ represent the results for the known sample and the EPD blind replicate, respectively. Generally, the closer the original results and their replicate or duplicate results are to each other, the lower the MRD.

### *Normalizing Data to the Reference Detection Limit*

Because some detection limits may be anomalously high (due to dilution or other effects, for example), it is necessary to use a reference detection limit (RDL) in the MRD calculations. This is set as the 90th percentile value. All the results less than the RDL are adjusted up to that value. Results that are detection limit values above the RDL are eliminated from the MRD index calculations. By definition, fewer than 10% of the detection limit values are above the RDL.

The intralaboratory MRD indexes for GE and Weston are listed in Tables 25 and 26, respectively.

- No results above RDL among those analyses included in calculating the MRD.
* No detection limit, or no duplicate or replicate results below detection limit.

## Calculations for Interlaboratory Comparisons

For interlaboratory comparisons, the MRD is calculated as the average absolute difference between the laboratories for the $i^{th}$ well expressed as a percentage of the mean of both laboratories. For these comparisons, $x_i$ and $y_i$ represent the mean analyte concentrations for the $i^{th}$ well; $x_i$ represents the mean from one laboratory and $y_i$ represents the mean from the other. The means are calculated from the known sample results and the EPD blind replicate results.

### *Choosing an RDL*

For interlaboratory comparisons, a new RDL must be established for calculation of the MRD. The interlaboratory RDL is chosen as the 90th percentile value from the array of detection limits from both laboratories; i.e., that detection limit value at or below which are 90% of the detection limit values from both laboratories.

### *Normalizing Data to the RDL*

All the results less than the RDL are adjusted to the new RDL value. Results that are de-

tection limit values above the RDL are eliminated from the MRD index comparison and from the *t*-tests. By definition, fewer than 10% of the detection limit values are above the RDL.

In addition to the interlaboratory MRD calculations, paired *t*-tests are performed to see if the difference between the mean concentrations of an analyte from the same well reported by each laboratory is significant. The *t*-test tests the null hypothesis that there is no significant difference in the concentrations reported by the two laboratories. The MRD and the *t*-test results for analytes with at least one pair of results above the interlaboratory RDL are listed in Table 27.

High MRDs (greater than 20) were calculated for the Weston laboratory duplicate analyses of bis (2-ethylhexyl) phthalate, cadmium, dichloromethane (methylene chloride), iron, kepone, lithium, potassium, silver, tin, zinc, gross alpha, nonvolatile beta, radium-226, and radium-228 (see Table 26). Table 30 lists analytes and wells from which samples and laboratory duplicates yielded results where one result was more than twice the other. The high MRD for iron is caused by differences in duplicate samples in wells BGO 50D, BGX 12C, EPT101, EPT103, EPT116, EPT121, EPT124, FAC 5, FSB 78A, FSB100A, HMD 2D, HSB140C, LFW 28, and LFW 43B. The high MRD for zinc is caused by differences in duplicate samples in wells BGX 12C, EPT101, EPT103, EPT106, EPT111, EPT116, EPT121, EPT124, FSB 78A, FSB100A, HMD 2D, HSB 85C, and HSB140C.

Interlaboratory comparison results (see Table 27) yielded MRDs greater than 20 for several analytes: antimony, bis(2-ethylhexyl) phthalate, dichloromethane (methylene chloride), iron, tin, total dissolved solids, total inorganic carbon, total organic halogens, total phosphates (as P), turbidity, zinc, nonvolatile beta, radium-226, and radium-228. Table 32 lists analytes and wells where a result from one laboratory was more than twice the corresponding result from the other laboratory. The high MRDs for antimony, dichloromethane (methylene chloride), total organic halogens, zinc, and nonvolatile beta correspond with low *t*-test probabilities. High MRD values indicate imprecise data. Low probability values indicate a significant, consistent bias between the laboratories, with one laboratory reporting results as consistently higher or lower than another.

Analytes with significance-of-probability values of less than .050 (see Table 27) have a 95% chance that one laboratory's results are significantly higher than those from the other laboratory. Among the seven analytes with values less than .050, only silica had significantly higher values for GE. Results for antimony, dichloromethane (methylene chloride), silver, total organic halogens, zinc, and nonvolatile beta are significantly higher for analyses from Weston. The laboratories use different methods for analyzing antimony and nonvolatile beta. See the **Methods** subsection of the **Analytical Data Review** section of this report for more information.

## QUALITY CONTROL STANDARDS

During third quarter 1992, EPD/EMS conducted a quality assessment of GE. The laboratory was sent a set of certified environmental quality control standards purchased

# QUALITY CONTROL SAMPLES

from Environmental Resource Associates (ERA) of Arvada, CO (Batch Numbers 414, 540, 544, 2536, 2539, 8906, 9941, and 9944). The results are listed in Table 33.

GE's results were compared with the ERA-certified values and advisory ranges. GE did not analyze for 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene as volatiles because of a discrepancy in analytical suites on the chain-of-custody form; there was insufficient sample volume to run both suites.

The nutrients vial was not analyzed for ammonia as N because the vial was broken in the lab. The organics (herbicides/pesticides) and toxaphene vials were accidentally thrown away before the analyses were performed. Of 81 analyses reported by GE, 78, or 96.3%, fell within the advisory range.

## BLANKS

Blanks are among the quality control measures discussed in the *RCRA Ground-water Monitoring Technical Enforcement Guidance Document* (EPA, 1986d). There are two general categories of blanks: sampling blanks, which test the integrity of field sample collection methods and equipment, and laboratory quality control blanks, which test for contamination or other false positives when samples are analyzed in the laboratory.

### Sampling Blanks

Two types of sampling blanks were sent to the laboratories during third quarter. Trip blanks (denoted as QA samples throughout this report)

are sample containers of deionized water that are transported to the well sample location, left unopened, and sent to the laboratory for analysis. They can be used to check for contamination resulting from transport, shipping, and site conditions. They also are used as blind blanks to test the laboratory's reliability.

Equipment blanks (EPT) are samples of deionized water that are opened at the sampling location and poured or pumped through the sampling device or metals filter to test for equipment contamination. Results from these blanks are used to identify possible contaminants in the sampling equipment.

**Laboratory Quality Control Blanks**

Laboratory blanks, also called internal blanks, are generated internally by a laboratory to test the integrity of its procedures and equipment.

**Analytical Results and Review**

During third quarter, four trip blanks were each reported with one constituent (cadmium, total inorganic carbon, radium-228, or total alpha-emitting radium) at Flag 2 levels; another was reported with gross alpha and nonvolatile beta above Flag 2 criteria. Antimony was detected above the Flag 2 criterion in eight equipment blanks, aluminum in three equipment blanks, cadmium in one equipment blank, and uranium in one equipment blank.

The **Analytical Data Review** section lists third-quarter laboratory blanks and EPD/EMS blind blanks (trip blanks) with elevated results, along with the groundwater samples that accompanied them in their respective analytical batches.

GE found that matrix interferences appear to be responsible for low spike recoveries for antimony for EPT 6, mercury for EPT 22, and selenium for EPT 2, EPT 20, EPT 21, EPT 22, EPT 23, EPT 24, EPT 25, EPT 26, EPT 27, EPT 80, QA 36C, QA 40C, QA 42C, QA 44C, and QA 66C. Also, because of matrix interferences, GE's spike recoveries for arsenic for EPT 13 and EPT 80 were unusually high.

A number of blanks were associated with laboratory and EPD/EMS blind blanks yielding elevated results for various constituents. The following tables list the blanks having elevated results with other laboratory and EPD/EMS blind blanks analyzed in the same batches.

Radium-228 was detected in two trip blanks (QA 112C and QA 108C) from Environmental Physics; this finding was not confirmed in split samples sent to Clemson TC.

The blanks tables in **Appendix B** list the dates, field measurements, and analytical results for all three types of sampling blanks. See **Appendix A** for a key to abbreviations used in the tables.

# 8. WATER LEVEL DATA

During third quarter 1992, water level measurements were obtained for hydrogeologic projects. Most of the data presented here were obtained as concurrent data for hydrogeologic interpretation in the A/M areas. Some wells not routinely monitored for the EPD/EMS groundwater monitoring program, as well as some wells outside the A/M areas, are included in these data. Only water levels were measured for this project; no field tests of water characteristics were conducted. Ge-Hy Environmental Sampling of New Ellenton, SC, collected the data.

# 10. GLOSSARY

*See also pp. A-1 and A-2 for keys to abbreviations used in the results tables in* **Appendix A.**

**2,4-D**. 2,4-Dichlorophenoxyacetic acid.

**absolute difference**. The unsigned result of the subtraction of any two numbers.

**advisory range**. A range of acceptable analytical results established by the provider of known samples.

**aerated sample**. Groundwater sample supplied or charged with air. Aeration can occur naturally or during well pumping.

**aliquot**. A portion of a sample being used for analysis.

**analyte**. Analyzed constituent.

**analytical detection limit**. The lowest reasonably accurate concentration of an analyte that can be detected; this value varies depending on the method, instrument, and dilution used.

**analytical modifier**. See **result qualifier**.

**APHA**. American Public Health Association.

**Appendix IX**. List of constituents specified by Appendix IX in the *Code of Federal Regulations*, Title 40, Part 264. Analyses for Appendix IX constituents are required by the Resource Conservation and Recovery Act (RCRA) under specified conditions.

**associated samples**. Samples analyzed by a laboratory in the same batch with blind blanks or laboratory blanks.

**ASTM**. American Society for Testing and Materials.

**bail**. To remove water from a well by lowering a container into the water, allowing it to fill with water, and removing it from the well.

**blank**. Aliquot of deionized water generated by laboratory or sampling personnel and analyzed like a groundwater sample. See **blind blank, internal blank, laboratory blank,** and **trip blank**. See also the **Blanks** subsection of the **Quality Control Samples** section of this report.

**blind blank**. A sample container of deionized water sent to a laboratory under an alias as a quality control check.

**blind replicate**. A second sample taken from a well at the same time as the primary sample and sent to the laboratory for analysis as an unknown.

**BNA**. Base/neutral and acid extractables; groups of organic compounds analyzed as part of the Appendix IX and Priority Pollutants suites; also, a group of compounds that can be analyzed by EPA Method 625.

**cation**. Positively charged ion.

**CERCLA**. Comprehensive Environmental Response, Compensation, and Liability Act.

**certified value**. The known concentration of an analyte in a referenced sample.

**CFR**. *Code of Federal Regulations*; sections of this annual document contain EPA standards and regulations for environmental monitoring.

**chain-of-custody record**. A form that documents the collection, transport, analysis, and disposal of well samples.

# GLOSSARY

**Clemson Technical Center, Inc.** Clemson Technical Center, Inc., of Anderson, SC.

**common analyses.** Common parameters tested for, and generally found, in drinking water.

**comprehensive analyses.** A group of analyses that forms the core of the EPD/EMS Groundwater Monitoring Program each quarter. See the **Sample Scheduling** section of this report for a complete list of constituents.

**CN.** See Clemson Technical Center, Inc.

**deionized water.** Water from which all charged species or ionizable organic and inorganic salts have been removed.

**detection limit.** See **analytical detection limit.**

**dilution factor.** The mathematical factor by which a sample is diluted in order to bring the concentration of an analyte in the sample within the analytical range of an instrument (e.g., 1 mL sample + 9 mL solvent = 1:10 dilution, or a dilution factor of 10).

**DL.** See **analytical detection limit.**

**DOE.** United States Department of Energy.

**drinking water standards.** Federal primary and secondary drinking water standards, as set forth by EPA.

**duplicate.** Duplicate sample; an aliquot of a primary sample.

**duplicate result.** A result obtained from identical analyses performed on more than one aliquot of a primary sample.

**DWS.** Drinking water standards (federal primary and secondary drinking water standards, as set forth by EPA).

**E.** A code letter used in the analytical data tables signifying an exponential (e.g., 3.4E+3 = $3.4 \times 10^3$ = 3,400).

**EM.** EPD/EMS Laboratory at SRS.

**EMS.** The Environmental Monitoring Section of the Environmental Protection Department at SRS.

**EPA.** United States Environmental Protection Agency.

**EPD.** Environmental Protection Department at SRS.

**EPD/EMS.** Environmental Protection Department's Environmental Monitoring Section.

**flagging criteria.** Criteria established to help determine the relative concentration and testing frequency for analytes. See the **Flagging Criteria** section of this report for further information.

**gamma PHA.** A group of analyses performed to determine activities of gamma-emitting radionuclides.

**GC VOA.** Gas Chromatographic Volatile Organics Analyses. Also used to refer to a group of volatile organic compounds that can be analyzed by gas chromatography.

**GCMS VOA.** Gas Chromatograph/Mass Spectrometer Volatile Organics Analyses. Also used to refer to a group of volatile organic compounds analyzed by gas chromatography and mass spectrometry methods.

**GE.** General Engineering Laboratories of Charleston, SC.

**Ge-Hy.** Ge-Hy Environmental Sampling of New Ellenton, SC.

**General Engineering.** See **GE.**

**GP.** Environmental Physics of Charleston, SC (subcontractor for General Engineering).

**halogen.** Any of the elements of the halogen family, consisting of fluorine, chlorine, bromine, iodine, and astatine.

**herbicides/pesticides.** A suite of analyses. See the **Sample Scheduling** section of this report for further information.

**holding time**. The length of time during which an analysis of a sample can be reliably performed; holding times vary depending on which constituents are being analyzed.

**interlaboratory comparisons**. Comparisons conducted between two or more laboratories.

**internal blank**. Deionized water or solvent sample generated by the laboratory; one is analyzed with each batch of samples as an in-house check of analytical procedures and equipment (same as a **laboratory blank**).

**intralaboratory comparisons**. Comparisons conducted within a single laboratory.

**ion**. An isolated electron or positron or an atom or molecule that, by loss or gain of one or more electrons, has acquired a net electric charge.

**laboratory blank**. See **internal blank**.

**major ions**. A group of analyses performed in the EPD/EMS Groundwater Monitoring Program to determine the concentrations of calcium, magnesium, potassium, and silica ions and the alkalinity of the sample.

**mean**. The arithmetic mean; a single number that typifies a set of numbers.

**method detection limit**. A reproducible analyte- and method-specific detection limit.

**µCi**. Microcurie; unit of radiation equivalent to 37,000 disintegrations per second.

**µg/L**. Micrograms per liter.

**µS/cm**. Microsiemens per centimeter, equivalent to micromhos per centimeter; the unit of conductance across two points, used as the measure of specific conductance in analytical data tables.

**mg/L**. Milligrams per liter.

**MRD**. Mean relative difference. For further information, see the **Quality Control Samples** section of this report.

**msl**. Mean sea level.

**NTU**. Nephelometric turbidity units; the standard unit of turbidity measurement.

**null hypothesis**. The assumption that there is no validity to the claim that two treatments of the same thing can be distinguished by a specific procedure.

**organic**. A chemical compound based on carbon chains or rings and containing hydrogen with or without oxygen, nitrogen, or other elements.

**PCB**. Polychlorinated biphenyl.

**pCi**. Picocurie; a unit of radiation equivalent to $3.7 \times 10^{-2}$ disintegrations per second.

**piezometer**. An instrument used to measure the potentiometric surface of groundwater. Also, a well designed for this purpose.

**plume**. A volume of contaminated air or water originating at a point-source emission (e.g., a smokestack) or a waste source (e.g., a hazardous-waste disposal site).

**potentiometric surface**. The surface to which water in an aquifer would rise by hydrostatic pressure if unconfined.

**primary laboratory**. A laboratory having a contract with EPD/EMS to perform a specific set of analyses; a primary laboratory may subcontract this work to other laboratories.

**purge**. To remove water from a well prior to sampling, generally by pumping or bailing. Under the EPD/EMS Groundwater Monitoring Program, four well volumes generally are purged before sampling.

**QA**. Quality assurance.

**QC**. Quality control.

**R**. Following a well name, denotes a blind replicate.

**radioisotopes**. Radioactive isotopes.

**radionuclide**. A nuclide at an unstable, high-energy level that seeks a more stable, lower-energy level by emitting particles of energy.

Through these emissions, the nuclear configuration decays to simpler nuclides.

**RCRA**. Resource Conservation and Recovery Act.

**RCRA site**. Solid-waste management unit under RCRA regulation.

**RDL**. See **reference detection limit**.

**reference detection limit**. The detection limit chosen to allow comparison of several analyses with different detection limits. For the purposes of this report, the individual detection limits of at least 90% of the analyses are less than the reference detection limit. See the **Quality Control Samples** section of this report for further information.

**replicate**. Replicate sample; used in this report to mean only those duplicate samples sent to the laboratory as unknowns. See **blind replicate**.

**Resource Conservation and Recovery Act (RCRA)**. Federal legislation that regulates the transport, treatment, and disposal of solid and hazardous wastes.

**result qualifier**. A code used to convey additional information about an analytical result. Also called an **analytical modifier**. See p. A-2 for additional information.

**RFI Program**. RCRA Facility Investigation Program; EPA-regulated investigation of a solid-waste management unit with regard to its potential impact on the environment.

**RFI/RI Program**. RCRA Facility Investigation/Remedial Investigation Program; at SRS, an expansion of the RFI Program to include CERCLA and hazardous-substance regulations.

**run date**. The date on which an analysis is performed.

**sampling device**. Anything used in sampling, especially portable (nondedicated) pumps and bailers. Possible source of sample contamination if not cleaned thoroughly between uses.

**SCDHEC**. South Carolina Department of Health and Environmental Control.

**seepage basin**. An excavation that receives wastewater. Designed to prevent overflow or surface runoff.

**settling basin**. A temporary holding basin (excavation) that receives wastewater.

**significance of probability**. The probability of observing a statistical value as significant as, or even more significant than, the value actually observed.

**site custodian**. WSRC employee responsible for a site being monitored.

**SP**. Spencer Testing Services, Inc., of Spencer, WV (subcontractor for General Engineering).

**SRL**. Savannah River Laboratory at SRS; now Savannah River Technology Center (SRTC).

**SRP**. Savannah River Plant; now Savannah River Site (SRS).

**SRS**. Savannah River Site.

**SRTC**. Savannah River Technology Center.

**STORET**. EPA national database for storage and retrieval of water quality information and monitoring data; some of the result qualifiers listed in the **Analytical Results** section of this report are based on STORET codes.

**surrogate**. An organic compound similar in composition and test performance to one of the analytes of interest; known quantities are used in an analysis as a quality assurance measure.

**tank farm**. An installation of interconnected underground tanks used for storage of high-level radioactive liquid wastes.

**TE**. Teledyne Isotopes of Northbrook, IL (subcontractor for General Engineering).

**TM**. TMA/Eberline of Oak Ridge, TN (subcontractor for Weston).

**trip blank**. A sample container of deionized water that is transported to the well sample location, treated as a well sample, and sent to the laboratory for analysis; trip blanks are used to check for contamination resulting from transport, shipping, and site conditions.

***t*-test**. Statistical method used to determine if the means of groups of observations are equal.

**turbidity**. A measure of the concentration of sediment or suspended particles in solution.

**(U)**. Unclassified.

**USDWS**. United States Public Health Service drinking water standard.

**volatile organic compounds**. A broad range of organic compounds, commonly halogenated, that vaporize at ambient, or relatively low, temperatures (e.g., acetone, benzene, chloroform, and methyl alcohol).

**WA**. Roy F. Weston, Inc., Lionville Laboratory, Lionville, PA.

**Weston**. See **WA**.

**wellhead**. The top of a well.

**well volume**. The volume of water between the well water surface and the bottom of the screen; the volume of water standing inside the well casing.

**WSRC**. Westinghouse Savannah River Company.

# Appendix A. ANALYTICAL RESULTS

This section presents the field and analytical results for samples collected during third quarter 1992. The tables are presented in alphabetical order by well series and in numerical order within each series. The **Site Index by Well Series** section of this report contains the area name(s) for each series.

The tabular data contain all field and analytical results for well samples collected during this quarter. Results of laboratory analyses on blanks are in **Appendix B** of this report.

Further information on inability to sample or unusual conditions of sample collection, as well as samplers' observations on the samples, may be found in the **Field Notes** section of this report.

**Key to the tables:**

CN = Clemson Technical Center, Inc.
E = exponential notation (e.g., 1.1E−09 = 1.1 × $10^{-9}$ = 0.0000000011)
EM = EPD/EMS Laboratory
F = Flag
GE = General Engineering Laboratories
GP = Environmental Physics
1,2,3,4,6,7,8-HPCDD = 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin
1,2,3,4,6,7,8-HPCDF = 1,2,3,4,6,7,8-Heptachlorodibenzo-p-furan
1,2,3,4,7,8-HXCDD = 1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin
1,2,3,4,7,8-HXCDF = 1,2,3,4,7,8-Hexachlorodibenzo-p-furan
Lindane = gamma-Benzene hexachloride
µCi/mL = microcuries per milliliter
µg/L = micrograms per liter
µS/cm = microsiemens per centimeter
mg/L = milligrams per liter
Mod = analytical modifier; see p. A-2 for explanation
msl = mean sea level
MSL = million structures per liter (for asbestos)
NTU = nephelometric turbidity units
1,2,3,7,8-PCDD = 1,2,3,7,8-Pentachlorodibenzo-p-dioxin
1,2,3,7,8-PCDF = 1,2,3,7,8-Pentachlorodibenzo-p-furan
SP = Spencer Testing Services, Inc.
2,4,5-T = 2,4,5-Trichlorophenoxyacetic acid
2,3,7,8-TCDD = 2,3,7,8-Tetrachlorodibenzo-p-dioxin
2,3,7,8-TCDF = 2,3,7,8-Tetrachlorodibenzo-p-furan
TE = Teledyne Isotopes
TM = TMA/Eberline
TOC = top of casing
WA = Roy F. Weston, Inc.

# ANALYTICAL RESULTS

Interpreting data with analytical modifiers (result qualifiers):

| Analytical modifier | Definition |
|---|---|
| (Blank) | Data not qualified. Result should be interpreted exactly as reported. |
| A* | Value reported is the mean of two or more determinations. |
| J** | Estimated because quantitation in the sample or in associated quality control samples did not meet specifications. |
| L* | Off-scale high. The actual value is not known but is known to be greater than the value shown. |
| M* | Presence of the analyte is verified but not quantified. |
| Q** | Sample held beyond normal holding time. If the holding time is exceeded by less than 30 days, the sample is coded JQ; if the holding time is exceeded by 30 days or more, the sample is coded QR. |
| R** | Rejected because performance requirements in the sample analysis or associated quality control analyses were not met. |
| T* | Undetected; if present, below the criteria of detection. |
| V** | Indicates the analyte was detected in the associated method blank. |
| Y** | The sample was unpreserved or improperly preserved when received by the laboratory. |
| 1 | The associated result may be an underestimation of the true value due to analytical bias. |
| 2 | The associated result may be an overestimation of the true value due to analytical bias. |
| 3 | The associated result may be of poor precision (high variability) due to analytical bias. For Weston analyses, replicate results were outside the 20% relative percent difference (RPD) guidance limit, or, for metals, the result is between the instrument detection limit and the contract-required detection limit. |
| 4 | Matrix interference. |
| 5 | The sample result is four or more times greater than the standard concentration. |
| 6 | Reanalyzed out of holding time because of problems with the original analysis. |

* This code is based on the CLP Laboratory Data Qualifiers from the U.S. Environmental Protection Agency.

** This code is based on the STORET codes from the U.S. Environmental Protection Agency.

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/24/92
Depth to water: 147.37 ft (44.92 m) below TOC
Water elevation: 232.93 ft (71.00 m) msl
Sp. conductance: 42 µS/cm
Water evacuated before sampling: 51 gal
Time: 7:40
pH: 5.3
Alkalinity: 7 mg/L
Water temperature: 20.4°C

## WELL AMB 6

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/24/92
Depth to water: 144.65 ft (44.09 m) below TOC
Water elevation: 232.55 ft (70.88 m) msl
Sp. conductance: 38 µS/cm
Water evacuated before sampling: 26 gal

Time: 8:45
pH: 5.4
Alkalinity: 6 mg/L
Water temperature: 21.7°C

## WELL AMB 10A

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/23/92
Depth to water: 149.18 ft (45.47 m) below TOC
Water elevation: 217.32 ft (66.24 m) msl
Sp. conductance: 901 µS/cm
Water evacuated before sampling: 75 gal
The well went dry during purging.

Time: 7:20
pH: 11.7
Alkalinity: 221 mg/L
Water temperature: 19.1°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/22/92
Depth to water: 6.79 ft (2.07 m) below TOC
Water elevation: 358.61 ft (109.31 m) msl
Sp. conductance: 149 µS/cm
Water evacuated before sampling: 53 gal
Time: 14:40
pH: 8.3
Alkalinity: 68 mg/L
Water temperature: 21.9°C

## WELL AMB 13AR

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/26/92 Time: 7:50
Depth to water: 148.87 ft (44.77 m) below TOC pH: 10.9
Water elevation: 218.23 ft (66.52 m) msl Alkalinity: 96 mg/L
Sp. conductance: 213 µS/cm Water temperature: 20.4°C
Water evacuated before sampling: 67 gal
The well went dry during purging.

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/14/92
Depth to water: 106.04 ft (32.32 m) below TOC
Water elevation: 235.06 ft (71.65 m) msl
Sp. conductance: 41 µS/cm
Water evacuated before sampling: 43 gal
Time: 8:20
pH: 5.1
Alkalinity: 0 mg/L
Water temperature: 20.6°C

## WELL AOB 2

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/14/92 — Time: 8:00
Depth to water: 108.87 ft (33.18 m) below TOC — pH: 5.3
Water elevation: 236.53 ft (72.10 m) msl — Alkalinity: 2 mg/L
Sp. conductance: 25 µS/cm — Water temperature: 20.9°C
Water evacuated before sampling: 43 gal

## WELL BGO 3D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/28/92
Depth to water: 57.46 ft (17.51 m) below TOC
Water elevation: 235.24 ft (71.70 m) msl
Sp. conductance: 50 µS/cm
Water evacuated before sampling: 4 gal
The well went dry during purging.

Time: 9:05
pH: 4.2
Alkalinity: 0 mg/L
Water temperature: 25.0°C

## WELL BGO 5D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/28/92
Depth to water: 65.63 ft (20.00 m) below TOC
Water elevation: 230.67 ft (70.31 m) msl
Sp. conductance: 46 µS/cm
Water evacuated before sampling: 5 gal
The well went dry during purging.

Time: 10:05
pH: 4.6
Alkalinity: 0 mg/L
Water temperature: 21.8°C

## WELL BGO 6C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/03/92
Depth to water: 65.48 ft (19.96 m) below TOC
Water elevation: 220.12 ft (67.09 m) msl
Sp. conductance: 136 µS/cm
Water evacuated before sampling: 183 gal

Time: 9:35
pH: 8.7
Alkalinity: 62 mg/L
Water temperature: 20.5°C

## WELL BGO 6D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/04/92
Depth to water: 54.56 ft (16.63 m) below TOC
Water elevation: 230.94 ft (70.39 m) msl
Sp. conductance: 116 µS/cm
Water evacuated before sampling: 7 gal
The well went dry during purging.

Time: 8:35
pH: 6.2
Alkalinity: 40 mg/L
Water temperature: 20.1°C

## WELL BGO 9AA

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/06/92 Time: 7:35
Depth to water: 127.40 ft (38.83 m) below TOC pH: 12.4
Water elevation: 157.40 ft (47.98 m) msl Alkalinity: 1363 mg/L
Sp. conductance: 4880 µS/cm Water temperature: 19.8°C
Water evacuated before sampling: 43 gal
The well went dry during purging.

## WELL BGO 9D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/03/92
Depth to water: 53.17 ft (16.21 m) below TOC
Water elevation: 231.93 ft (70.69 m) msl
Sp. conductance: 35 µS/cm
Water evacuated before sampling: 60 gal

Time: 15:10
pH: 4.7
Alkalinity: 0 mg/L
Water temperature: 21.0°C

## WELL BGO 10AR Replicate

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/04/92
Depth to water: 142.26 ft (43.36 m) below TOC
Water elevation: 158.24 ft (48.23 m) msl
Sp. conductance: 253 µS/cm
Water evacuated before sampling: 164 gal
Time: 10:10
pH: 7.5
Alkalinity: 104 mg/L
Water temperature: 20.5°C

## WELL BGO 10B

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/11/92
Depth to water: 80.96 ft (24.68 m) below TOC
Water elevation: 220.04 ft (67.07 m) msl
Sp. conductance: 174 µS/cm
Water evacuated before sampling: 48 gal
The well went dry during purging.

Time: 7:05
pH: 10.3
Alkalinity: 44 mg/L
Water temperature: 20.5°C

## WELL BGO 12CR

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/04/92
Depth to water: 92.36 ft (28.15 m) below TOC
Water elevation: 221.64 ft (67.56 m) msl
Sp. conductance: 216 µS/cm
Water evacuated before sampling: 43 gal
The well went dry during purging.

Time: 11:20
pH: 10.5
Alkalinity: 73 mg/L
Water temperature: 22.5°C

## WELL BGO 12D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/06/92
Depth to water: 82.13 ft (25.03 m) below TOC
Water elevation: 231 57 ft (70.58 m) msl
Sp. conductance: 131 µS/cm
Water evacuated before sampling: 8 gal
The well went dry during purging.

Time: 8:10
pH: 6.4
Alkalinity: 25 mg/L
Water temperature: 20.5°C

## WELL BGO 13DR

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/13/92 — Time: 8:10
Depth to water: 67.82 ft (26.77 m) below TOC — pH: 6.3
Water elevation: 231.48 ft (70.56 m) msl — Alkalinity: 21 mg/L
Sp. conductance: 81 µS/cm — Water temperature: 20.2°C
Water evacuated before sampling: 9 gal
The well went dry during purging.

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/05/92
Depth to water: 76.46 ft (23.31 m) below TOC
Water elevation: 224.04 ft (68.29 m) msl
Sp. conductance: 123 µS/cm
Water evacuated before sampling: 16 gal
The well went dry during purging.

Time: 9:05
pH: 7.0
Alkalinity: 24 mg/L
Water temperature: 20.9°C

## WELL BGO 16A

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/20/92 — Time: 9:10
Depth to water: 143.45 ft (43.72 m) below TOC — pH: 11.7
Water elevation: 161.55 ft (49.24 m) msl — Alkalinity: 401 mg/L
Sp. conductance: 1750 µS/cm — Water temperature: 20.3°C
Water evacuated before sampling: 22 gal
The well went dry during purging.

## WELL BGO 16D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/20/92
Time: 9:35
Depth to water: 73.15 ft (22.30 m) below TOC
pH: 10.7
Water elevation: 231.45 ft (70.55 m) msl
Alkalinity: 132 mg/L
Sp. conductance: 385 µS/cm
Water temperature: 20.5°C
Water evacuated before sampling: 4 gal
The well went dry during purging.

## WELL BGO 22D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/19/92
Depth to water: 53.28 ft (16.24 m) below TOC
Water elevation: 233.22 ft (71.09 m) msl
Sp. conductance: 22 µS/cm
Water evacuated before sampling: 102 gal

Time: 11:05
pH: 4.8
Alkalinity: 1 mg/L
Water temperature: 21.6°C

## WELL BGO 25A

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/05/92
Depth to water: 134.95 ft (41.13 m) below TOC
Water elevation: 161.55 ft (49.24 m) msl
Sp. conductance: 249 µS/cm
Water evacuated before sampling: 21 gal
The well went dry during purging.

Time: 8:00
pH: 7.3
Alkalinity: 105 mg/L
Water temperature: 20.1°C

## WELL BGO 26A

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/05/92 Time: 11:30
Depth to water: 128.48 ft (39.16 m) below TOC
Water elevation: 158.72 ft (48.38 m) msl
Inaccessibility or mechanical problem prevented sample collection.

## WELL BGO 26D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/06/92 Time: 8:40
Depth to water: 56.92 ft (17.35 m) below TOC pH: 5.0
Water elevation: 228.58 ft (69.67 m) msl Alkalinity: 1 mg/L
Sp. conductance: 29 µS/cm Water temperature: 19.9°C
Water evacuated before sampling: 9 gal
The well went dry during purging.

## WELL BGO 27C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/05/92
Depth to water: 54.52 ft (16.62 m) below TOC
Water elevation: 221.48 ft (67.51 m) msl
Sp. conductance: 129 µS/cm
Water evacuated before sampling: 175 gal
Time: 12:30
pH: 6.9
Alkalinity: 35 mg/L
Water temperature: 20.2°C

## WELL BGC 27D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/06/92
Depth to water: 48.16 ft (14.68 m) below TOC
Water elevation: 228.14 ft (69.54 m) msl
Sp. conductance: 34 µS/cm
Water evacuated before sampling: 12 gal
The well went dry during purging.

Time: 9:15
pH: 4.8
Alkalinity: 0 mg/L
Water temperature: 20.0°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/06/92
Depth to water: 48.45 ft (14.77 m) below TOC
Water elevation: 226.35 ft (68.99 m) msl
Sp. conductance: 114 µS/cm
Water evacuated before sampling: 12 gal
The well went dry during purging.

Time: 10:50
pH: 5.6
Alkalinity: 12 mg/L
Water temperature: 21.0°C

## WELL BGO 31D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/13/92 — Time: 8:45
Depth to water: 46.28 ft (14.11 m) below TOC — pH: 4.6
Water elevation: 227.42 ft (69.32 m) msl — Alkalinity: 0 mg/L
Sp. conductance: 34 µS/cm — Water temperature: 21.1°C
Water evacuated before sampling: 9 gal
The well went dry during purging.

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/13/92 — Time: 7:10
Depth to water: 53.51 ft (16.31 m) below TOC — pH: 4.8
Water elevation: 226.19 ft (69.55 m) msl — Alkalinity: 0 mg/L
Sp. conductance: 68 µS/cm — Water temperature: 21.7°C
Water evacuated before sampling: 6 gal
The well went dry during purging.

## WELL BGO 33D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/07/92 — Time: 7:10
Depth to water: 49.42 ft (15.06 m) below TOC — pH: 4.6
Water elevation: 230.86 ft (70.37 m) msl — Alkalinity: 0 mg/L
Sp. conductance: 89 µS/cm — Water temperature: 21.2°C
Water evacuated before sampling: 11 gal
The well went dry during purging.

## WELL BGO 34D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/07/92
Depth to water: 41.21 ft (12.56 m) below TOC
Water elevation: 233.69 ft (71.23 m) msl
Sp. conductance: 33 µS/cm
Water evacuated before sampling: 13 gal
The well went dry during purging.

Time: 7:45
pH: 5.5
Alkalinity: 2 mg/L
Water temperature: 20.4°C

## WELL BGO 35D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/13/92 Time: 7:35
Depth to water: 38.41 ft (11.71 m) below TOC pH: 4.6
Water elevation: 235.09 ft (71.66 m) msl Alkalinity: 0 mg/L
Sp. conductance: 37 µS/cm Water temperature: 20.7°C
Water evacuated before sampling: 10 gal
The well went dry during purging.

## WELL BGO 36D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 08/07/92 Time: 9:00
Depth to water: 38.18 ft (11.64 m) below TOC pH: 4.8
Water elevation: 237.22 ft (72.31 m) msl Alkalinity: 0 mg/L
Sp. conductance: 28 µS/cm Water temperature: 20.6°C
Water evacuated before sampling: 9 gal
The well went dry during purging.

## WELL BGX 1C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92 Time: 12:45
Depth to water: 75.36 ft (22.97 m) below TOC pH: 11.4
Water elevation: 215.94 ft (65.82 m) msl Alkalinity: 171 mg/L
Sp. conductance: 510 µS/cm Water temperature: 22.1°C
Water evacuated before sampling: 15 gal
The well went dry during purging.

# ANALYTICAL RESULTS

## WELL BGX 1D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92
Depth to water: 62.09 ft (18.93 m) below TOC
Water elevation: 229.21 ft (69.86 m) msl
Sp. conductance: 62 µS/cm
Water evacuated before sampling: 7 gal
The well went dry during purging.

Time: 12:15
pH: 5.5
Alkalinity: 14 mg/L
Water temperature: 22.9°C

## WELL BGX 2B

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92 Time: 13:35
Depth to water: 78.57 ft (24.25 m) below TOC pH: 8.2
Water elevation: 211.73 ft (64.54 m) msl Alkalinity: 77 mg/L
Sp. conductance: 212 µS/cm Water temperature: 22.1°C
Water evacuated before sampling: 48 gal
The well went dry during purging.

## WELL BGX 2D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92
Depth to water: 75.95 ft (23.15 m) below TOC
Water elevation: 215.15 ft (65.58 m) msl
Sp. conductance: 65 µS/cm
Water evacuated before sampling: 21 gal
The well went dry during purging.
Time: 14:00
pH: 5.4
Alkalinity: 4 mg/L
Water temperature: 22.3°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/31/92 — Time: 15:25
Depth to water: 75.01 ft (22.86 m) below TOC — pH: 5.2
Water elevation: 215.89 ft (65.80 m) msl — Alkalinity: 3 mg/L
Sp. conductance: 37 µS/cm — Water temperature: 22.1°C
Water evacuated before sampling: 32 gal

# ANALYTICAL RESULTS

## WELL BGX 6D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/31/92
Depth to water: 70.82 ft (21.59 m) below TOC
Water elevation: 206.18 ft (62.84 m) msl
Sp. conductance: 70 µS/cm
Water evacuated before sampling: 40 gal

Time: 7:40
pH: 6.0
Alkalinity: 16 mg/L
Water temperature: 20.7°C

## WELL BGX 6D Replicate

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/31/92
Depth to water: 70.82 ft (21.58 m) below TOC
Water elevation: 206.18 ft (62.84 m) msl
Sp. conductance: 70 µS/cm
Water evacuated before sampling: 40 gal

Time: 7:40
pH: 6.0
Alkalinity: 16 mg/L
Water temperature: 20.7°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/31/92
Depth to water: 52.70 ft (16.06 m) below TOC
Water elevation: 226.70 ft (69.10 m) msl
Sp. conductance: 28 µS/cm
Water evacuated before sampling: 38 gal

Time: 17:25
pH: 4.9
Alkalinity: 1 mg/L
Water temperature: 23.2°C

## WELL BGX 10D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92
Depth to water: 51.12 ft (15.58 m) below TOC
Water elevation: 225.76 ft (68.82 m) msl
Sp. conductance: 45 µS/cm
Water evacuated before sampling: 3 gal
The well went dry during purging.

Time: 14:25
pH: 5.8
Alkalinity: 6 mg/L
Water temperature: 23.0°C

## WELL BGX 11D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/31/92
Depth to water: 40.43 ft (12.32 m) below TOC
Water elevation: 235.87 ft (71.89 m) msl
Sp. conductance: 74 µS/cm
Water evacuated before sampling: 6 gal
The well went dry during purging.
Time: 8:45
pH: 5.7
Alkalinity: 15 mg/L
Water temperature: 21.5°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92
Depth to water: 40.30 ft (12.28 m) below TOC
Water elevation: 234.80 ft (71.57 m) msl
Sp. conductance: 30 µS/cm
Water evacuated before sampling: 159 gal
Time: 7:40
pH: 5.5
Alkalinity: 8 mg/L
Water temperature: 20.5°C

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92
Depth to water: 40.30 ft (12.28 m) below TOC
Water elevation: 234.80 ft (71.57 m) msl
Sp. conductance: 30 µS/cm
Water evacuated before sampling: 159 gal
Time: 7:40
pH: 5.5
Alkalinity: 8 mg/L
Water temperature: 20.5°C

## WELL BGX 12D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/30/92 Time: 8:35
Depth to water: 35.95 ft (10.96 m) below TOC pH: 5.0
Water elevation: 239.25 ft (72.92 m) msl Alkalinity: 2 mg/L
Sp. conductance: 21 µS/cm Water temperature: 20.9°C
Water evacuated before sampling: 5 gal
The well went dry during purging.

# ANALYTICAL RESULTS

## WELL CBR 1D

MEASUREMENTS CONDUCTED IN THE FIELD

Sample date: 07/29/92 — Time: 9:55
Depth to water: 46.45 ft (14.16 m) below TOC — pH: 5.2
Water elevation: 254.15 ft (77.47 m) msl — Alkalinity: 2 mg/L
Sp. conductance: 28 µS/cm — Water temperature: 22.1°C
Water evacuated before sampling: 61 gal

Sp. conductance: 201 µS/cm
Water evacuated before sampling: 152 gal
Time: 11:45
pH: 7.4
Alkalinity: 86 mg/L
Water temperature: 20.7°C
