

Effects of varied study and test conditions on brain activity related to subsequent memory

Laura Matzen, Sandia National Laboratories

Kara Federmeier, University of Illinois at Urbana-Champaign

Michael Haass, Sandia National Laboratories

Background

- Goal of study:
 - Use event-related potentials (ERPs) to assess performance during learning and memory tasks
 - What patterns of brain activity at study are associated with the best performance at test?
 - Repetition effects
 - Dm effects
 - Can ERPs indicate whether people are using an effective study strategy?

Overview of the Dm Effect

- Difference related to subsequent memory
- Words studied while EEG is recorded:
fight, alarm, cut, nation, storm, fire, noon...

Overview of the Dm Effect

- Difference related to subsequent memory
- At test: Words are **REMEMBERED** or **FORGOTTEN**
fight, alarm, cut, nation, storm, fire, noon...

Overview of the Dm Effect

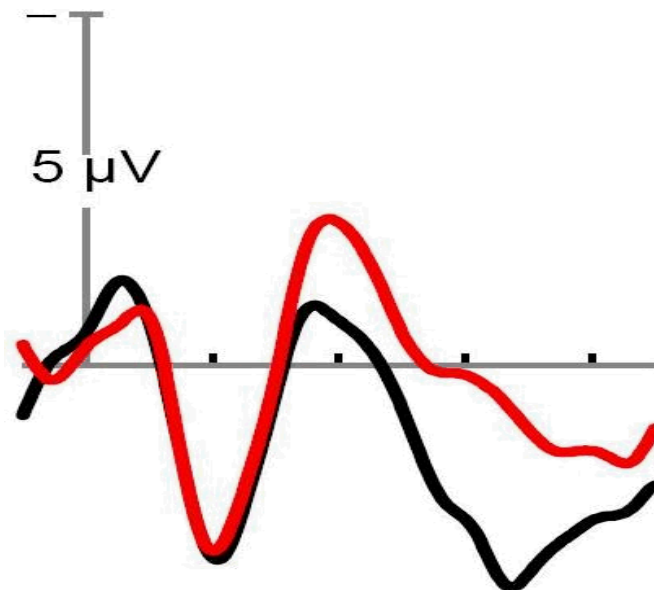

- Difference related to subsequent memory
- At test: Words are **REMEMBERED** or **FORGOTTEN**
fight, **alarm**, **cut**, nation, **storm**, fire, noon...

Overview of the Dm Effect

- Difference related to subsequent memory
- At test: Words are **REMEMBERED** or **FORGOTTEN**
fight, **alarm**, **cut**, nation, **storm**, fire, noon...

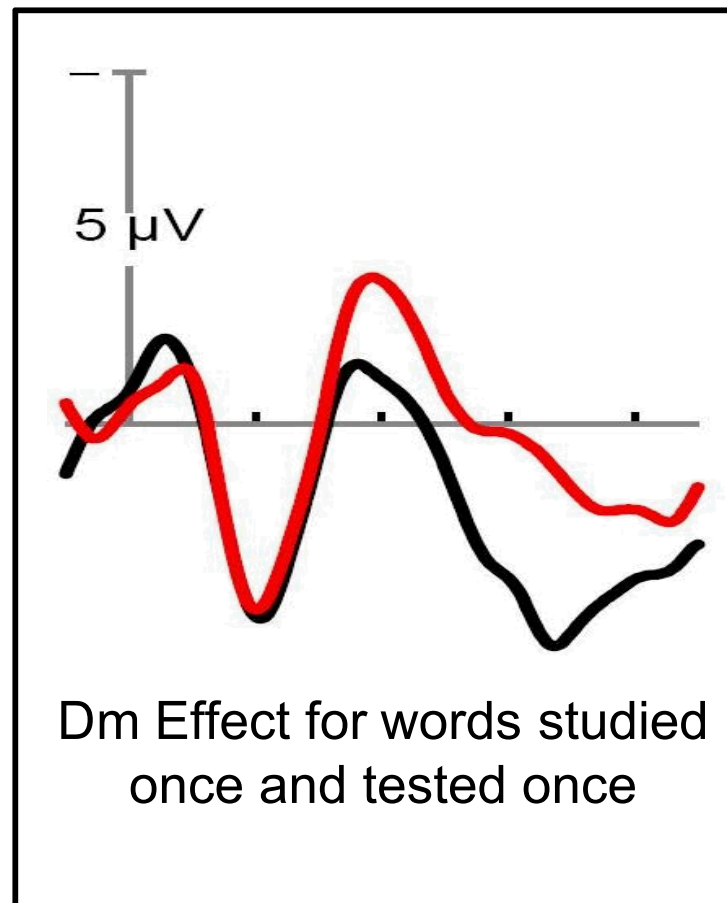

Event-related potentials (ERPs) from STUDY are sorted by memory performance:

Words that will be remembered later more positive than words that will be **forgotten**

Overview of the Dm Effect

- Dm Effect suggests that brain activity recorded at study can be predictive of later memory performance
- Which aspects of the encoding signal are predictive of later memory under more complex encoding conditions?

Words studied once

Subsequent Test

- Items from all conditions tested (or retested), along with an equal number of new, unstudied items

Predictions

- Better memory at test for words quizzed during study
- Better memory at test for spaced repetitions

Repetition effects during study

Summary of Repetition Effects

- N400 repetition effect at short lags
 - Implicit memory for repeated word
- LPC elicited by short lag repetitions and by explicit testing
 - Explicit search of memory/recollection of studying word previously
- Best behavioral memory performance associated with LPC (explicit memory) in absence of N400 facilitation (implicit memory)
- **But what about the twice-studied items?**
 - No behavioral spacing effect
 - No LPC elicited by long lag repetitions

Summary of Repetition Effects

- N400 repetition effect at short lags
 - Implicit memory for repeated word
- LPC elicited by short lag repetitions and by explicit testing
 - Explicit search of memory/recollection of studying word previously
- Best behavioral memory performance associated with LPC (explicit memory) in absence of N400 facilitation (implicit memory)
- How do the repetition effects relate to the Dm Effect?

Summary of Dm Effects

- Classic Dm Effect for once-presented words
- No Dm Effect for the first presentations of repeated words
 - More of those words would have been forgotten if not for additional presentations
 - Subsequent memory driven by second presentation of the words

Summary of Dm Effects

- What about the items that were studied twice with a long lag between presentations?
 - No spacing effect
 - No LPC
 - No Dm Effect...
- Individual differences?

Study Strategies

- Quizzing during study session benefited memory at test
- Could some participants have adopted a self-testing strategy for the words that were not quizzed?
- **Developed computational model to predict whether or not participants were using a self-testing strategy**
 - Compared behavioral performance and ERPs at study for participants classified as using passive study or self-testing strategies

Model Example

Known Conditions

First presentation of studied words

Words quizzed after long lag

Unknown Condition

Words repeated after long lag

Model Classification Results

- 18 of 23 participants classified as using passive study strategy
 - Average performance at test: 45% correct
- 5 participants classified as using a self-testing strategy
 - Average performance at test: 72% correct

ERPs Sorted by Model Classification

“Passive Study” Group

“Self-testing” Group

- First presentation of studied words
- Words quizzed after long lag
- Words repeated after long lag

Unknown
condition

Spacing Effects

■ Self-testing ■ Passive study
