*Title:* Los Alamos National Laboratory Update

*Author(s):* Alan R. Bishop, Janet A. Mercer-Smith, and Duncan W. McBranch

*Intended for:* LANS/LLNS Science and Technology Committee Meeting  
Los Alamos, NM USA  
October 19, 2011

Los Alamos National Laboratory, an affirmative action/equal opportunity employer, is operated by the Los Alamos National Security, LLC for the National Nuclear Security Administration of the U.S. Department of Energy under contract DE-AC52-06NA25396. By acceptance of this article, the publisher recognizes that the U.S. Government retains a nonexclusive, royalty-free license to publish or reproduce the published form of this contribution, or to allow others to do so, for U.S. Government purposes. Los Alamos National Laboratory requests that the publisher identify this article as work performed under the auspices of the U.S. Department of Energy. Los Alamos National Laboratory strongly supports academic freedom and a researcher's right to publish; as an institution, however, the Laboratory does not endorse the viewpoint of a publication or guarantee its technical correctness.

## **Los Alamos National Laboratory Update**

Alan R. Bishop, Janet A. Mercer-Smith, and Duncan W. McBranch

The Laboratory provides science solution to the mission areas of nuclear deterrence, global security, and energy security. The strength of LANL's science is at the core of the Laboratory. The Laboratory addresses important science questions for stockpile stewardship, global security, and energy security. The presentation will describe research and external scientific award highlights that have occurred during the last quarter.

# Dr. Richard T. (Dick) Sayre, Scientist 6: A Game-changer for Los Alamos

- Successful hire of a leading scientist, innovator, and entrepreneur.
- Internationally renowned biologist with funded programs in energy technology, public health and genomics.
- Research with a global impact; “One of five crop researchers who could change the world” (*Nature*, December 2008).
- Has led many multi-institutional international initiatives in bioenergy and biotechnology.
- Transformational for LANL: his extraordinary expertise and leadership will complement LANL’s capabilities in computational and experimental science.
- Benefit to LANL, LANS, NNSA, and DOE to catalyze interdisciplinary research and enable new capability and technical infrastructure.
- Expected key contributions:
  - Support Laboratory mission & programs
  - Attract & develop talent
  - Enable partnerships and technology transfer
  - Bring international recognition to the Laboratory

UNCLASSIFIED

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

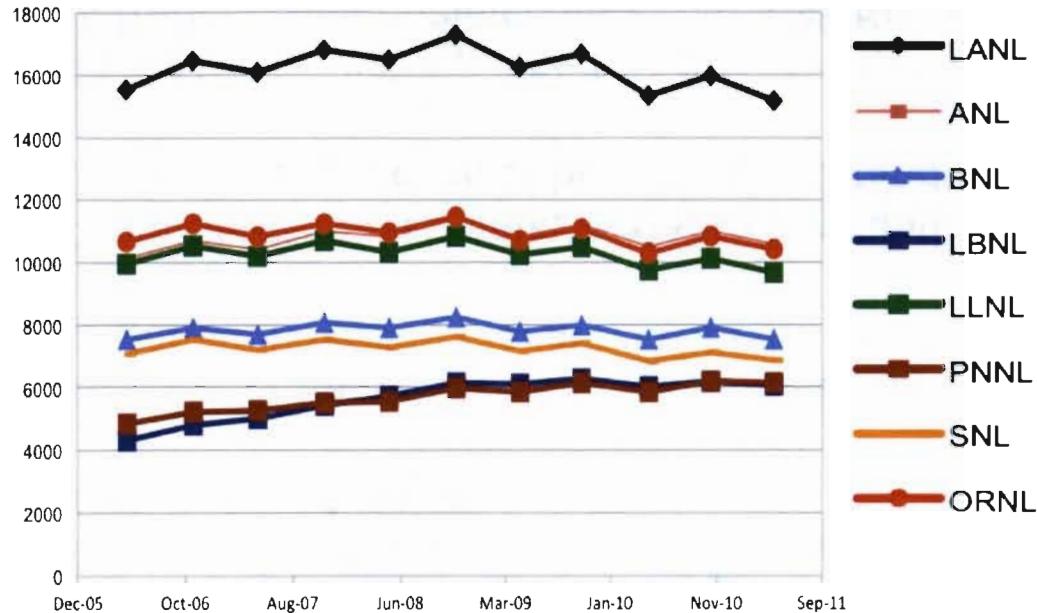

## LANL adds Marie Curie Distinguished Postdoc Fellow.

- Named after the distinguished nuclear scientist and only person honored with two Nobel Prizes in different scientific categories (Physics and Chemistry).
- Provides the opportunity to collaborate with LANL scientists and engineers on staff-initiated research.
- Open to outstanding women scientists and engineers, of all nationalities, who are engaged in research aligned with the Lab's missions.
- Candidates must display extraordinary ability in scientific research and show clear and definite promise of becoming outstanding leaders in their research.
- Other LANL Distinguished Postdoctoral Fellowships include Richard P. Feynman, J. Robert Oppenheimer, and Frederick Reines.

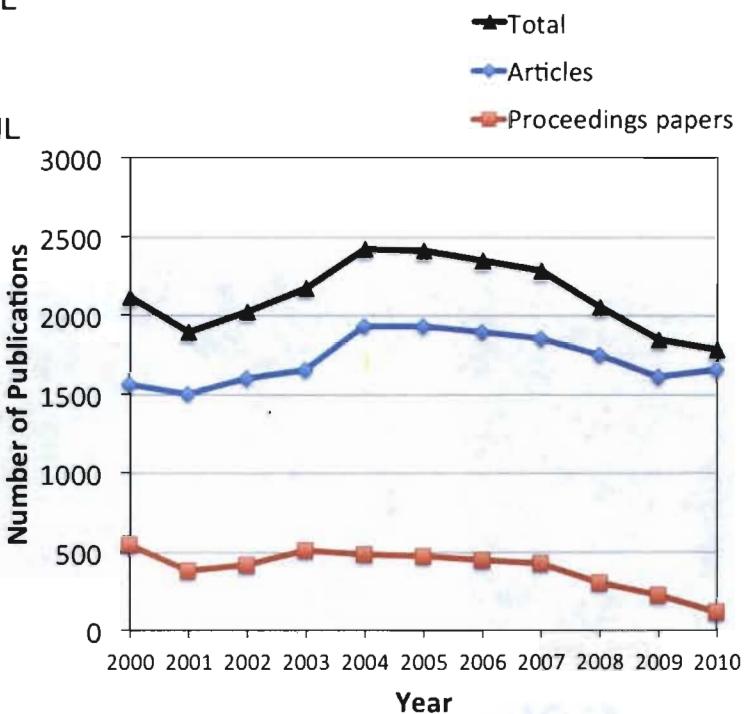

# Publications reflect the quality of science.

## Publication Comparison (moving 10 year sums): 2005-2010

LANL generated 2,079 peer-reviewed publications in FY11, the most since 2006.

## LANL ISI Publications 2000 - 2010

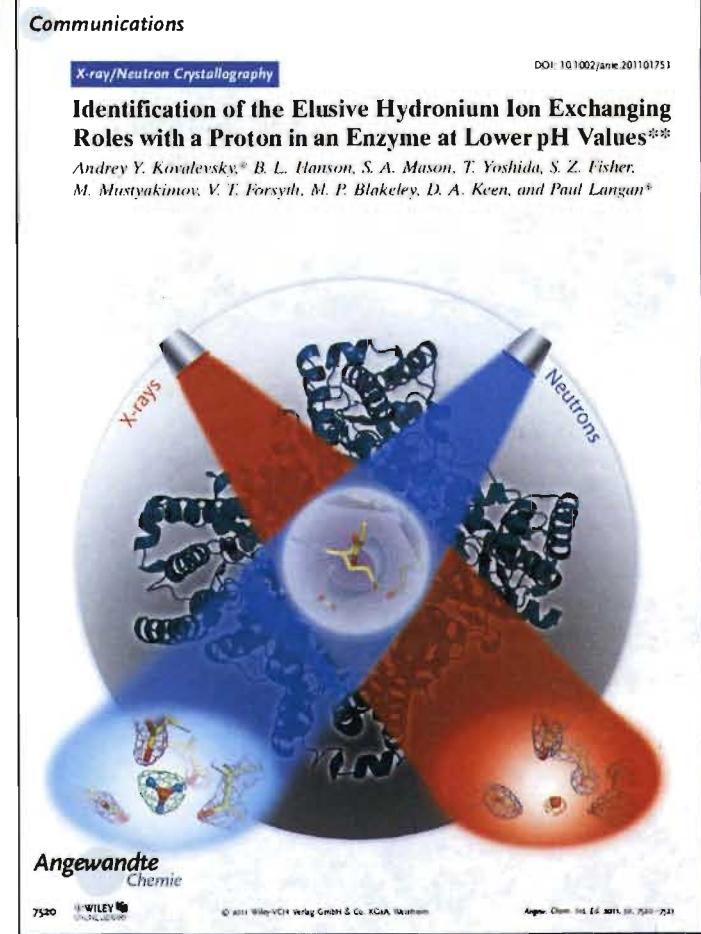

## LANSCE reveals role of hydronium ion in biocatalysis.

- LANSCE gave an unique view of the critical role that hydronium ion (water molecule bound to an additional hydrogen ion) plays in certain biological reactions (*Angewandte Chemie International Edition*).

- Enabled understanding of the role played by the elusive hydronium ion in the transfer of protons during enzyme-catalyzed reactions.

Insight could aid in treatment of peptic ulcers or acid reflux disease, or allow for more efficient conversion of woody waste into transportation fuels.

Hydronium ion is important in the catalytic mechanisms of enzymes.

# Science achievements support the Lab's mission areas for national security science.

- Solar wind samples from Genesis mission give insight into the birth of the solar system (2 *Science* papers).
- First oxygen and nitrogen isotopic measurements of the Sun demonstrate that they are very different from the elemental stable isotope ratios on Earth.
- These isotopic measurements were the top priorities of NASA's Genesis mission, the first spacecraft to return from beyond the moon.
- LANL developed the Solar Wind Concentrator for Genesis to enhance the flow of solar wind onto a small collector target.

Research enhances the Lab's Global Security mission area and Science of Signatures science pillar.

UNCLASSIFIED

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

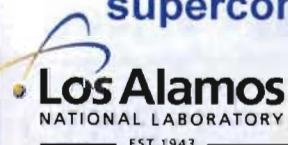

The Genesis Concentrator target after the crash of the sample return capsule

## Understanding the Complex Phase Diagram of Uranium

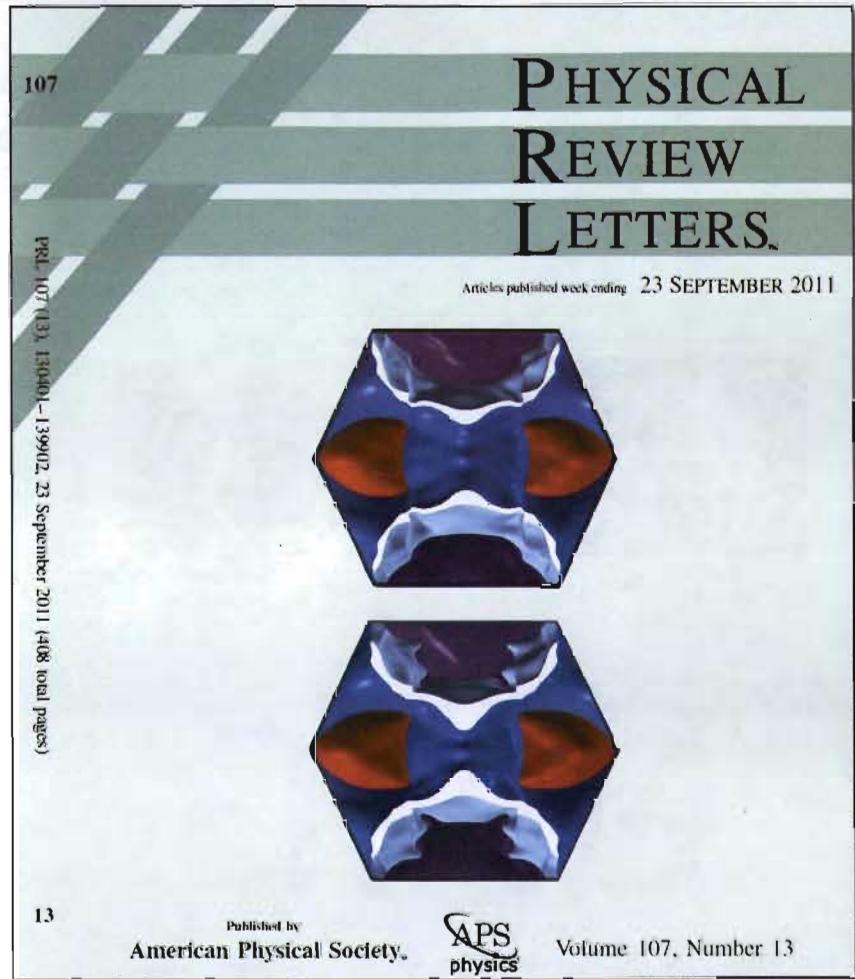

- Experimental and theoretical investigation of the role of electron-phonon coupling in determining the low temperature phase diagram of uranium.
- Theoretical calculations show that the Fermi surface nesting is unchanged when pressure is applied.
- Theoretical calculations estimate electron-phonon coupling and show that it correlates well with the charge-density-wave state.
- Charge-density-wave state does not develop because the electron-phonon coupling is too weak to transmit the electronic information to the lattice.

**Provides insight into the mechanisms that govern the interplay between charge-density-wave and superconductivity in alpha-uranium.**

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

UNCLASSIFIED

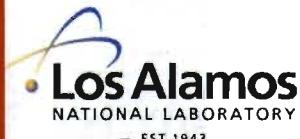

**Cross section of the Fermi-surface topology for the alpha-uranium structure calculated at ambient pressure (top) and 20 Gpa (bottom)**

## Progress in ultra-low field MRI for whole body imaging.

- Goal is a MRI system that is cost-effect, convenient, compact, and portable.
- Seek alternative to low temperature SQUIDs (superconducting quantum interference devices) in a special shielded room.
- Implementation of room temperature magnetometer eliminates need for cryogens, SQUIDs, and shielded room.
- Increasing the frequency and the prepolarization field strength improves sensitivity by more than an order of magnitude.

**Multi-channel system could enable large-size imaging of head, spine, or whole body.**

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

UNCLASSIFIED

## Experiments and simulations enable studies of protostellar jets.

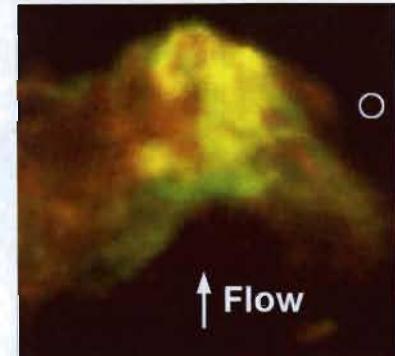

- LANL collaboration with Rice University, University of Rochester, AWE, and General Atomics uses simulations and small scale experiments to understand astrophysical phenomena (*Astrophysical Journal* 2011).
- Herbig-Haro protostellar jets have been observed long enough by the Hubble Space Telescope to create “movies” of the evolution of these jets.
- Experiments at the Omega Laser examine the dynamic behavior of plasma jets in a clumpy medium similar to the protostellar environment, but at a very different length scale.
- LANL designed and analyzed the experiments using the Los Alamos Rage codes.

Research enhanced the Lab's Information Science and Technology for Integrative & Predictive Science pillar.

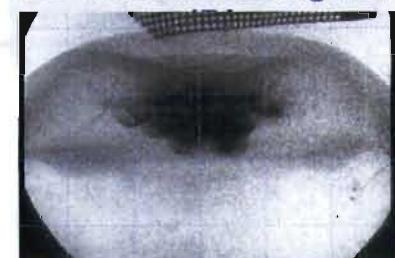

UNCLASSIFIED

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

Hubble Telescope image of bow shock in Herbig-Haro

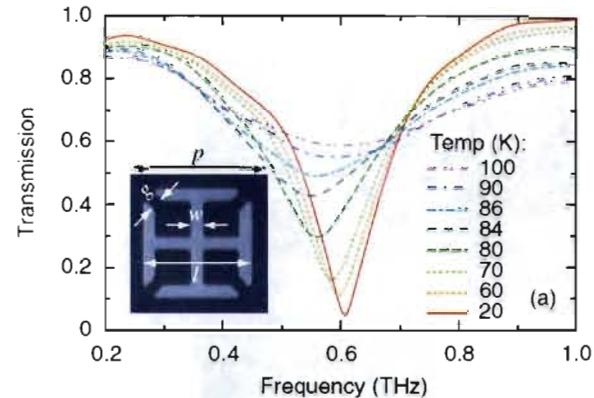

Radiograph from Omega laser experiment

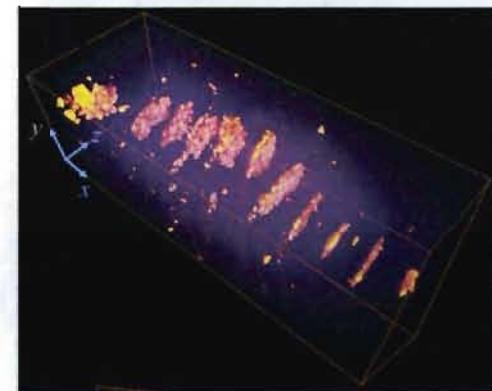

Simulated radiograph of experiment

## Advances in metamaterials support the Lab's mission areas for national security science.

- Tuned the resonance in high temperature superconducting terahertz metamaterials (*Physical Review Letters*).
  - Varying the temperature enables efficient switching and frequency tuning.
  - Numerical simulations reproduce the experiments.
  - Provides path to develop novel multifunctional metamaterials.
- Developed fast and inexpensive method to fabricate 3D metamaterial structures (*Review of Scientific Instruments*).
  - Fabricated 3D periodic structure using high-frequency acoustic waves in a resonator cavity.
  - Acoustic waves direct nanoparticles toward the nodes of the standing wave field to form parallel periodic planes within a 3D matrix of epoxy.
  - The periodic pattern becomes permanent with cure of the epoxy.

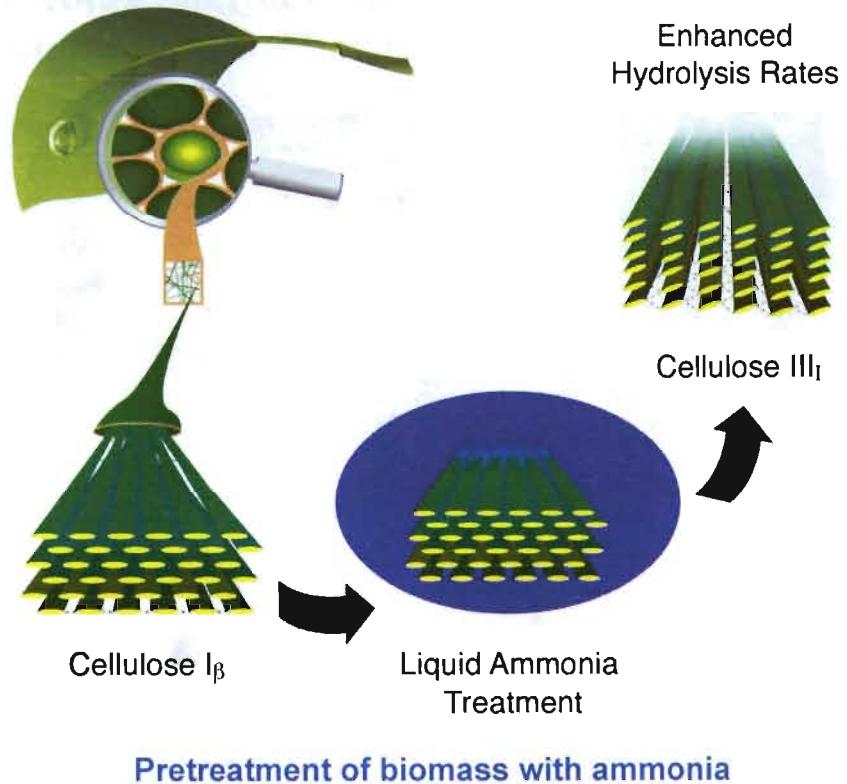

Combines superconductors and metamaterials for unique properties

Nanocomposite metamaterial containing diamond nanoparticles

## Simulations and experiments guide biofuel treatment.

- Discovered potential key to degrade biomass for biofuels (*Journal of the American Chemical Society*).
  - Employed high performance simulations and experiments.
  - Molecular modeling showed how pretreatment decreases intrasheet hydrogen bond network of crystalline cellulose.
  - Pretreatment makes cellulose five times more digestible by enzymes that convert it to ethanol.

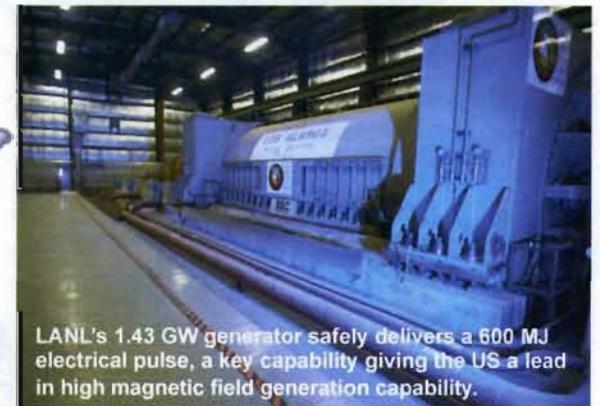

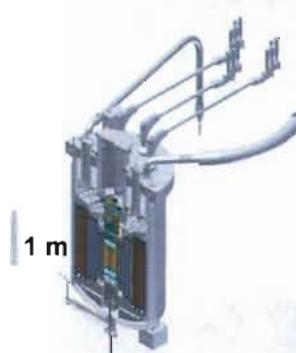

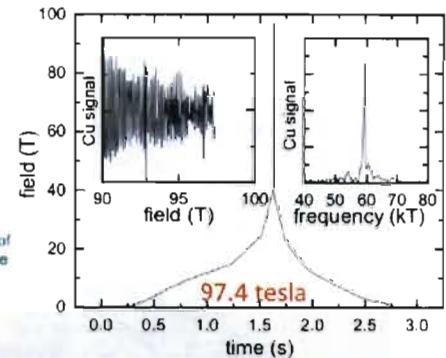

Provides potentially less costly and less energy intensive method that makes cellulose easier to degrade.

# National High Magnetic Field Laboratory's Pulsed Field Facility (NHMFL-PFF) sets new world record.

- World record: strongest magnetic field produced by a *nondestructive* magnet.
- Achieved a record field of 92.5 tesla on August 18, then surpassed their record with a 97.4-tesla field the next day.
  - Earth's magnetic field is 0.0004 tesla, a medical MRI scan has a magnetic field of 3 tesla.
- The Pulsed Magnet was engineered and built at LANL (AET, MST, MPA Divisions).
- NHMFL-PFF, a national user facility, now provides the unique capability for magnetic pulses of 95 tesla.

Confirmed 97.4 tesla via magneto quantum oscillations in polycrystalline copper.

Provides an unprecedented tool to study fundamental properties of materials and understand the physics of structurally complex systems at a quantum level.

UNCLASSIFIED

## National High Magnetic Field Laboratory's Pulsed Field Facility (NHMFL-PFF) explores material in extremes.

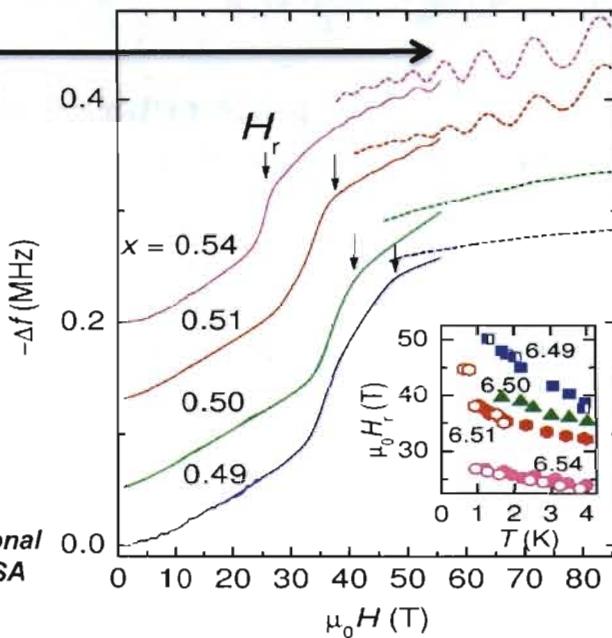

### New states of matter revealed in Ultra-High Magnetic Fields

- Magneto-quantum oscillations reveal the Fermi surface of materials.

- Each color represents a separate doping of a High  $T_c$  superconductor.

Proceedings of the National Academy of Sciences USA

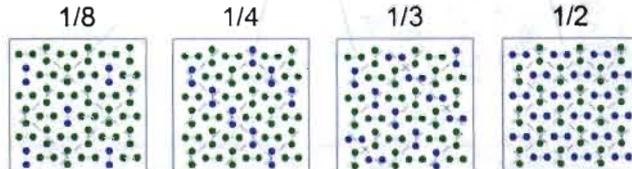

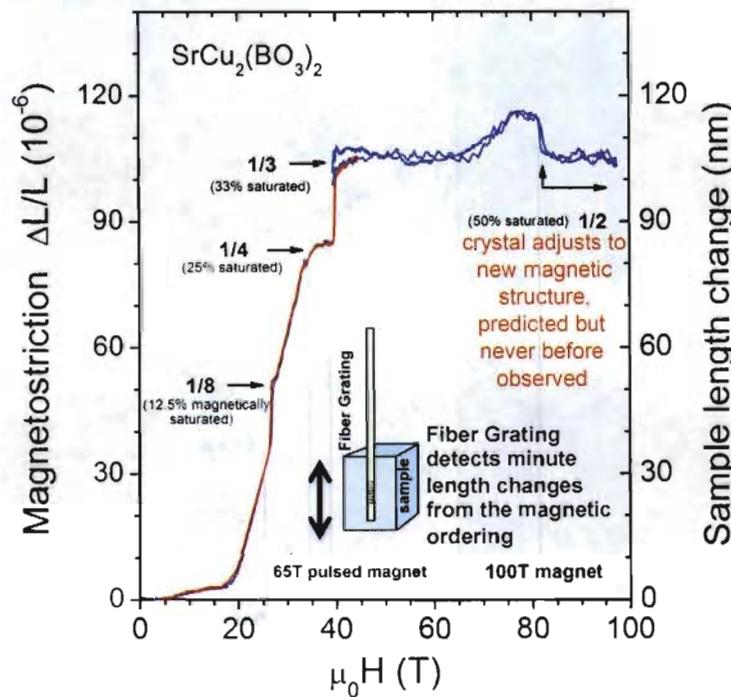

- Very high magnetic fields are essential to reveal a material's quantum energy states, which yield electronic structure and electron mass.
- Inset shows the temperature dependence of the quantum oscillations (each point represents a distinct magnetic field pulse.)

 **Los Alamos**  
NATIONAL LABORATORY  
EST. 1943

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

- Developed optical technique to sense the "magnetostriction" of a magnetic material.

UNCLASSIFIED

Multiple Magnetic States are driven by magnetic field

# Industrial partnerships enable the Lab's mission areas for national security science.

- LANL and Raytheon received a patent for the Multimodal Radiation Imager.
  - Combines two gamma-ray imaging techniques to detect radiological materials.
  - Sensitive detection is needed for accidental release or nonproliferation.
  - Imager can scan a given area from up to 100 meters away while driving

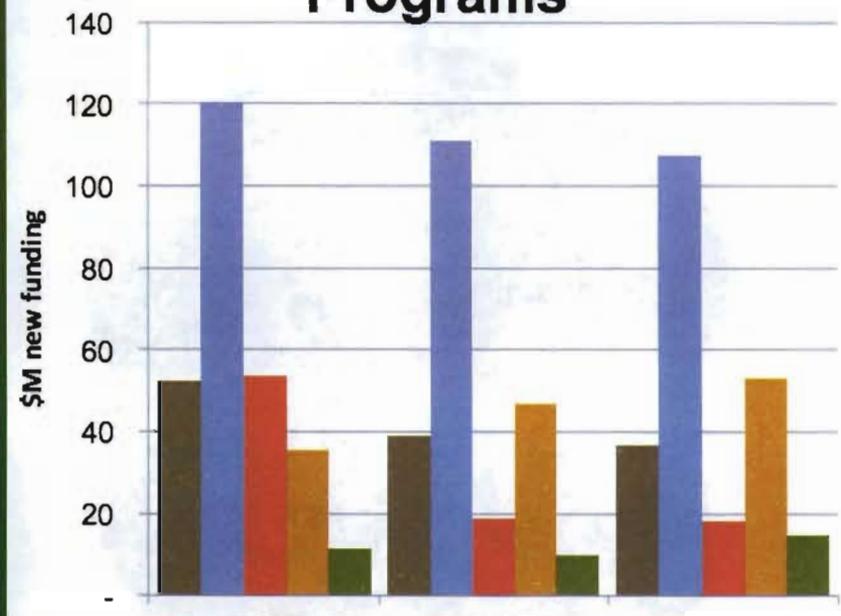

Leverages intellectual property and industry partners for mission delivery and capability enhancement.

Live testing shows path of the truck, test source locations, and images of the sources.

# Science and Energy Programs: FY10-12

## Science & Energy Programs

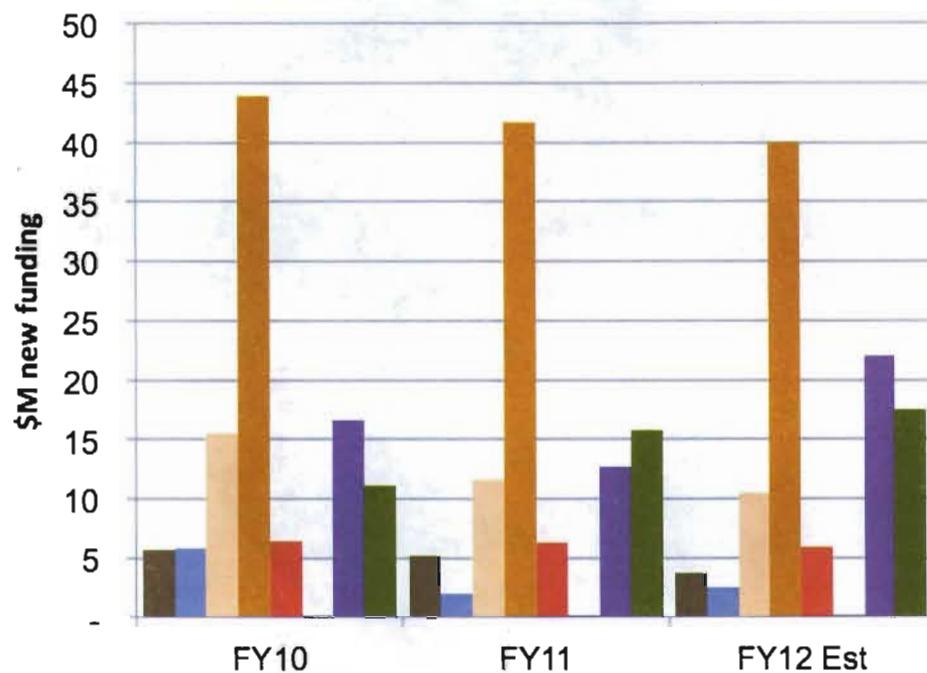

- Civilian Nuclear
- Applied Energy
- NIH

Operated by Los Alamos National Security, LLC for the U.S. Department of Energy's NNSA

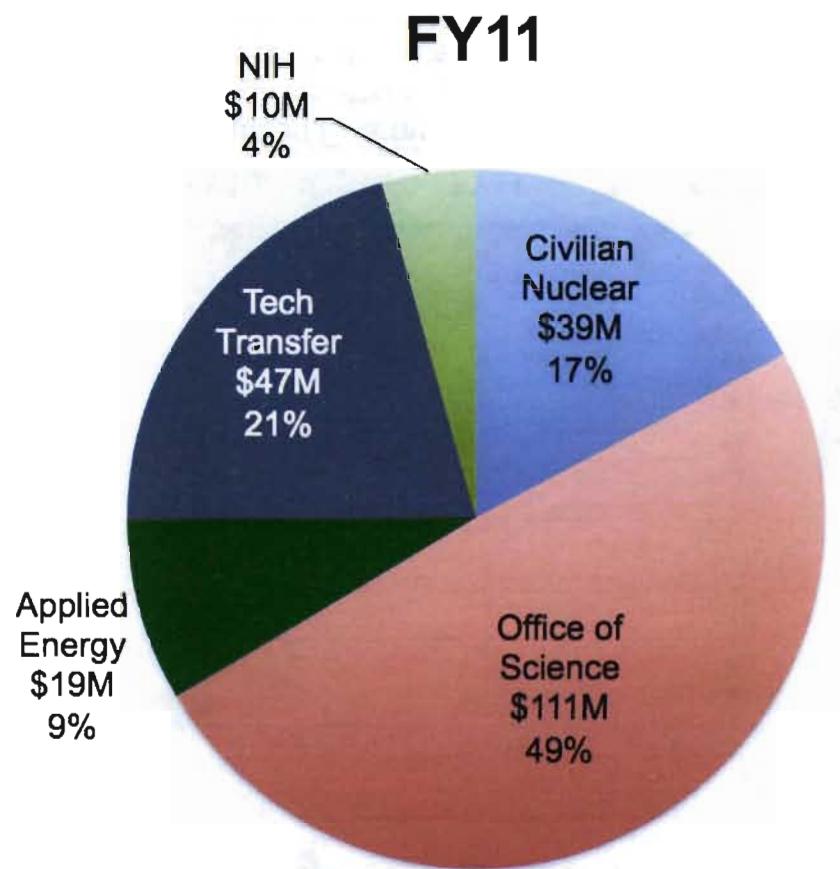

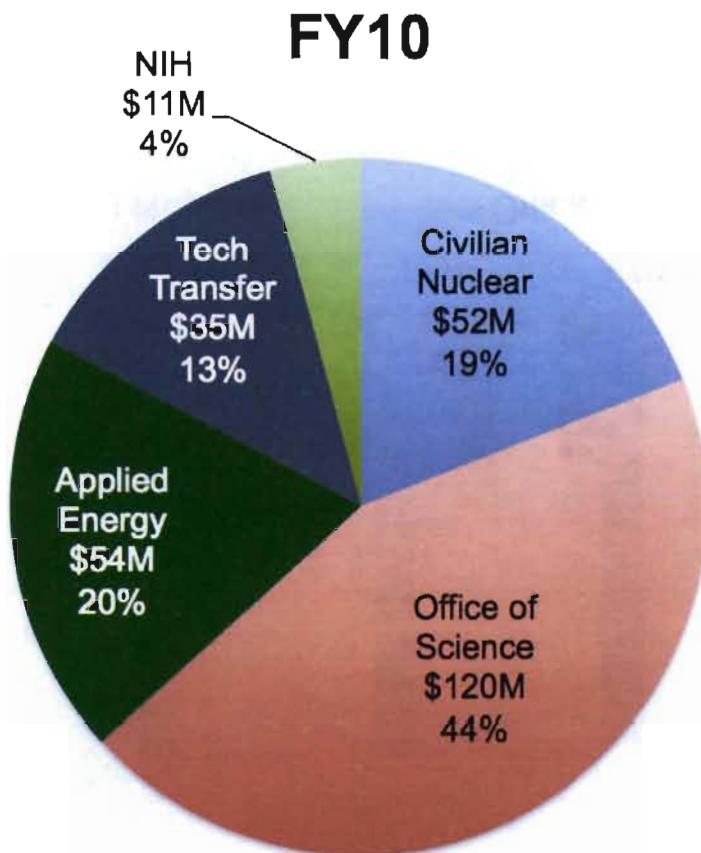

## Office of Science Program Detail

- Fusion Energy
- High Energy Physics
- Nuclear Physics
- Basic Energy Sciences
- Advanced Scientific Computing Research
- Workforce Development
- Biological & Environmental Research
- Isotope Production

UNCLASSIFIED

## Science and Energy Program Funding: FY10-11

## Equipment Obtained during FY 2011

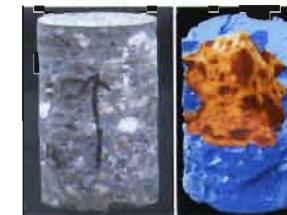

- 700 MHz Nuclear Magnetic Resonance - (\$1,718 K)
- High resolution, high transmission secondary ion mass spectrometer (SIMS) - (\$1,300 K)
- Spectral Signature Experimental Laboratory (\$596 K)
- Neutron computed tomography instrument - (\$533 K)
- Protein crystallography X-ray unit - (\$499 K)
- Spectrometer for Materials Research at Temperature and Stress (SMARTS)/HIPPO quenching furnace capability - (\$300 K)
- High resolution gamma detector in Detector for Advanced Neutron Capture Experiments (DANCE) - (\$270 K)

Mass spectrometer

Growth chamber

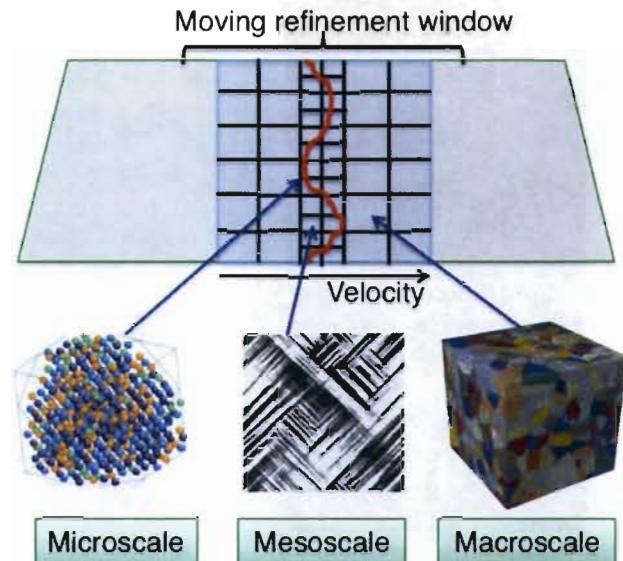

Neutron tomography

DANCE

# LANL leads the Exascale Co-Design Center for Materials in Extreme Environments (ExMatEx) and partners in others.

- Co-design is a new paradigm in which the exascale hardware, system software, and application codes are concurrently designed to create the exascale simulation environment.
- The goal is to achieve more realistic large scale simulations of materials in extreme mechanical and radiation environments.
- A predictive understanding of the response of materials to extreme conditions underpins DOE and NNSA missions and Laboratory programs.

Massachusetts Institute of Technology

## MaRIE External Advisory Board met in August, 2011

[Present: J. Hemminger (Chair), C. Baker, M. Cappiello, P. Fleury, R. Hemley, W. Herrmannsfeldt, A. Kerman, C. Mailhot, T. Mason, R. Selden, J. Birely (ex-officio)]

- **Have we articulated an acquisition strategy for MaRIE that is complete and compelling? Is our status with partnering appropriate for MaRIE's level of development?**

“The strong focus on the NA-10 call-for-proposals for long-range experimental facilities is appropriate and responsive. This is a key and unprecedented opportunity that must be seized vigorously. The acquisition strategy, including any options for a phased build, needs to remain flexible.”

“We have seen much more substance in partnering activities. Interactions with the other labs is much more advanced than we have seen in the past and this will be critical for the future development of the MaRIE program.”

- **Consistent with an NNSA-centric acquisition, are the weapons mission drivers sufficiently compelling to justify the mission need for a \$1B class facility and to intrigue and engage the broader scientific community?**

“The classified presentations had a significant degree of coherence and uniformity in the message they delivered....The presenters clearly identified the types of issues that arise in the stockpile (e.g., aging, and refurbishment). There is a growing recognition in the weapons program that a long-term experimentally-validated predictive capability will require a facility such as MaRIE.”

*DIR McMillan reiterated his commitment to MaRIE and his focus on the NA-10 facility call.*

# NNSA has launched a “New Facilities Committee” emulating Orbach 2003 SC Facility Plan.

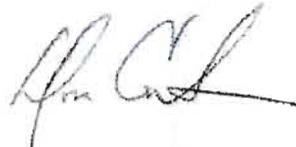

MEMORANDUM FOR PAUL HOMMERT  
PRESIDENT AND LABORATORIES DIRECTOR  
SANDIA NATIONAL LABORATORIES

CHARLES MCMILLAN  
DIRECTOR, LOS ALAMOS NATIONAL LABORATORY

GEORGE MILLER  
DIRECTOR, LAWRENCE LIVERMORE NATIONAL  
LABORATORY

FROM: DONALD L. COOK  
DEPUTY ADMINISTRATOR  
FOR DEFENSE PROGRAMS

SUBJECT: Planning for Future NNSA Experimental Facilities

ISSUE: Request that the laboratories follow the process developed by the “New Facilities Committee” (members nominated by the laboratory directors) for creating a long-term strategy for future experimental facilities.

## New Facilities Committee

**Jason Puet, NNSA**  
**Melissa Marggraff, LLNL**  
**Julia Phillips, SNL**  
**John Sarrao, LANL**

## Meetings

**LLNL, 6/28; DC, 7/14**

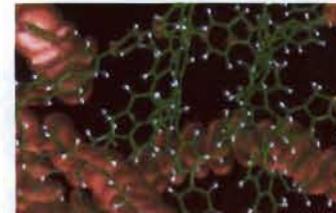

## Output

**Define values, criteria,  
proposal content, review  
process  
(NOT to perform actual review)**

**Call issued Sept. 16, 2011**  
**Proposals due Feb. 15, 2012**

# New LDRD DR Projects Beginning in FY 12

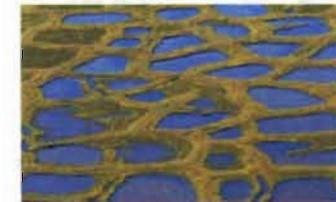

- Organic Electronic Materials: Designing and Creating Functional Interfaces
- Energy Storage
- Dynamic Earthquake Triggering, Granular Physics and Earthquake Forecasting
- Genetically Encoded Materials: Libraries of Stimuli-responsive Polymers
- TeV Jets: Nature's Particle Accelerators
- Integrated Modeling of Perturbations in Atmospheres for Conjunction Tracking
- Hydrodynamical Mix Studies at the National Ignition Facility (U)
- Advancing the Fundamental Understanding of Fission (U)
- Predicting Climate Impacts and Feedbacks in the Terrestrial Arctic
- Physics Beyond the Standard Model with the Long-Baseline Neutrino Experiment
- Hierarchical Sparse Models for Robust Analysis of Video Data
- Elucidating Humankind's Evolving Environment
- Plutonium-242: A National Resource for the Fundamental Understanding of 5f Electrons
- Modern Challenges in Actinide Science
- Quantum Science: From Information to Materials

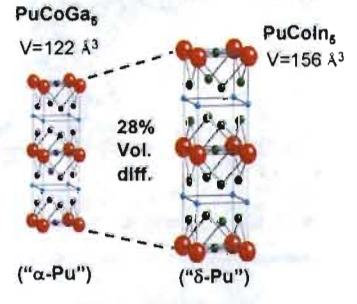

Organic Electronic Materials

TeV jets

Predicting Climate Impacts in the Arctic

# Premier National Security Science Lab: US needs now more than ever

- Accelerating discovery to innovation for technology delivery
- Interdisciplinary science of systems at scale: *From Understanding to Prediction*
- Sustaining the environment for success:
  - Excellent people
  - Exciting scientific challenges
  - Unique facilities/infrastructure

R&D Equipment

- **People:** Managing a technical workforce for science & engineering excellence
- **Delivering mission impact:** Indicators of success
- **Investing in the future:** FY12 and beyond

## Biofuel research advances with algae on several fronts.

- **First pilot-scale demonstration of oil and gas “produced water” to grow algae for biofuels**
  - Oil and gas production in the US bring about 800 billion gallons of saline “produced water” to the surface annually.
  - This impure water could be used to grow algae for biofuels.
  - Working with industrial partners on water quality for cultivation.
- **Developed an efficient, innovative process to convert algae-derived oils to hydrocarbons for fuel.**
  - The carboxylic acid groups from fatty acid oils and makes a hydrocarbon that can easily be reformed to fuels.
- **Optimized a LANL-developed process to harvest biofuel from algae.**
  - LANL process is based on the R&D Award-winning Ultrasonic Algal Biofuel Harvester.
- **Developed world’s first genetically engineered “magnetic” algae.**
  - Expressed gene from magnetotactic bacteria in green algae to create magnetic nanoparticles, enabling separation of the algae with a permanent magnet.

Algae grows in mixed media with produced water.

A dilute “pond” solution of algae before treatment (left tube) and after treatment (right tube).

## WNR Project Update

- Demolition and pit excavation complete 08/12/11
- Additional earthwork and excavation required due to poor soil conditions; some delays due to thunderstorms and poor drainage
- Structural steel delivery and concrete placement scheduled for week of 09/26/11
- Current EAC with known trends accounted for = \$2.11M
- Current funding available = \$2.4M
- Working with sub-contractor to pull schedule in as much as possible
