

## CLEANER ENERGY FOR CARS

All forms of energy that come from the ground will run out in hundreds of years. Some people try to use power from the sun or wind, but large use of this is many years away. For now, we need to work to find a better way to use energy that comes from the ground to power our cars and make lots of things while keeping the world from getting too warm.

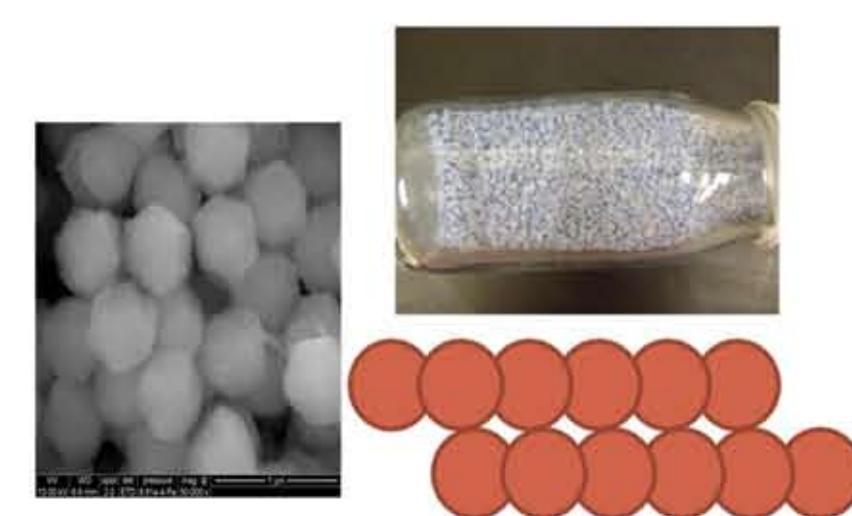

We work with one form of energy that comes from the ground. Usually this form of energy is just burned to make power. Often this form of energy is lost because it is hard to move from the place it is taken from the ground to somewhere it can be used.

We want to change this form of energy into another form that can be used to power a car. The second form is like something you drink, except that it will make you very sick. This form is much easier to move. When used to power a car, this energy form leaves the air cleaner than the energy we use now.

Now a hot way that uses lots of energy and takes much money is used to change the energy from the ground into the second form of energy. We are working to find a cool way that uses little energy and takes much less money. The key is to find the right "something that helps" to change the energy form. The "something that helps" will speed up the change and use less energy. We hope to find a "something that helps" that uses air to change the energy from the ground into energy that is easy to use in your car.

**“Something that Helps”**
