

# “Small”

By Joseph Montoya  
Department of Chemical Engineering, Stanford University

Sometimes, you have to think small.  
You'll probably want to think big most times,  
but often our problems take tinier eyes,  
and big ones won't see them at all.

Now, our troubles with energy are serious,  
As we speak, our world gets warmer,  
and even if you really love summer,  
how long can this kind of world carry us?

For our part, we think small, moving bit by bit,  
storing energy by breaking water to into pieces on rocks,  
forming water in cars to help them go,  
and using the power of the sun to do it.  
Our eyes and hands, fixed on the tiniest building blocks,  
are showing how small things can make it all so.
