

Exceptional service in the national interest

Integrated Energy-Water Planning in the Western and Texas Interconnections

Vincent Tidwell

Fall Meeting of the AGU

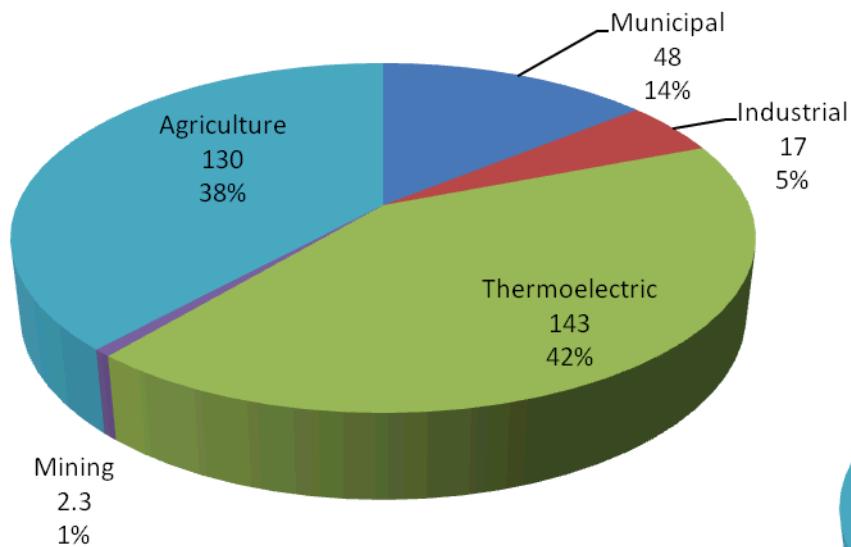

December 9, 2013

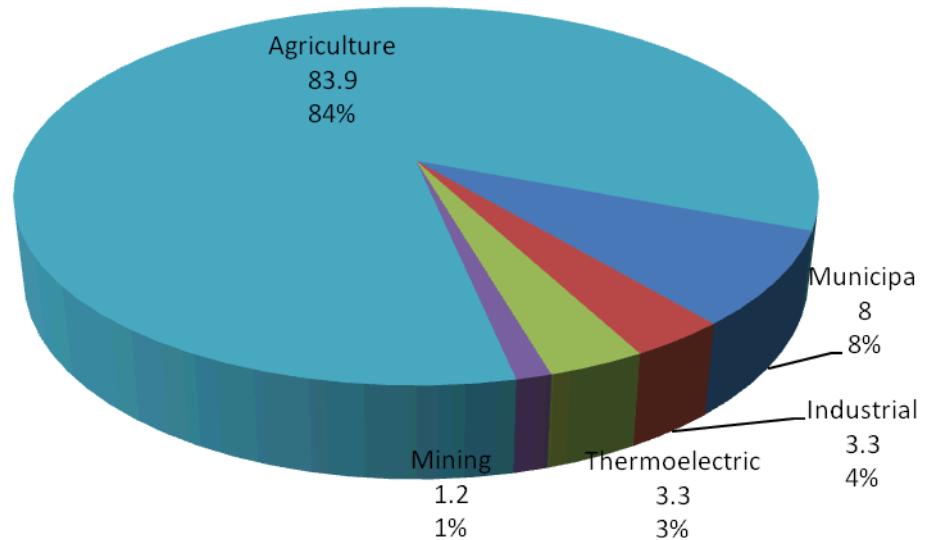

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

Water for Thermoelectric Power Generation

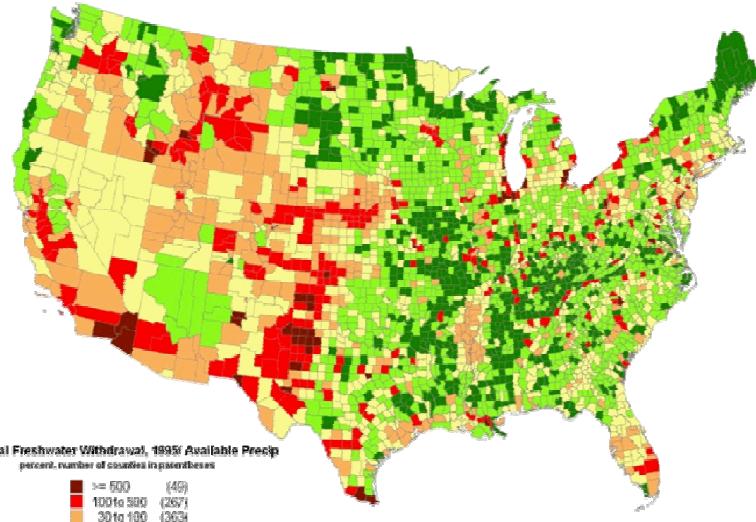

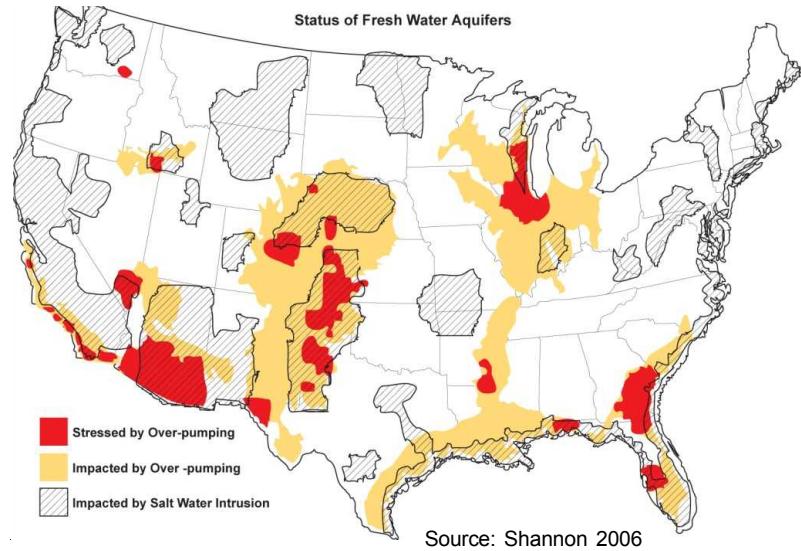

Water Withdrawal (BGD) 2005

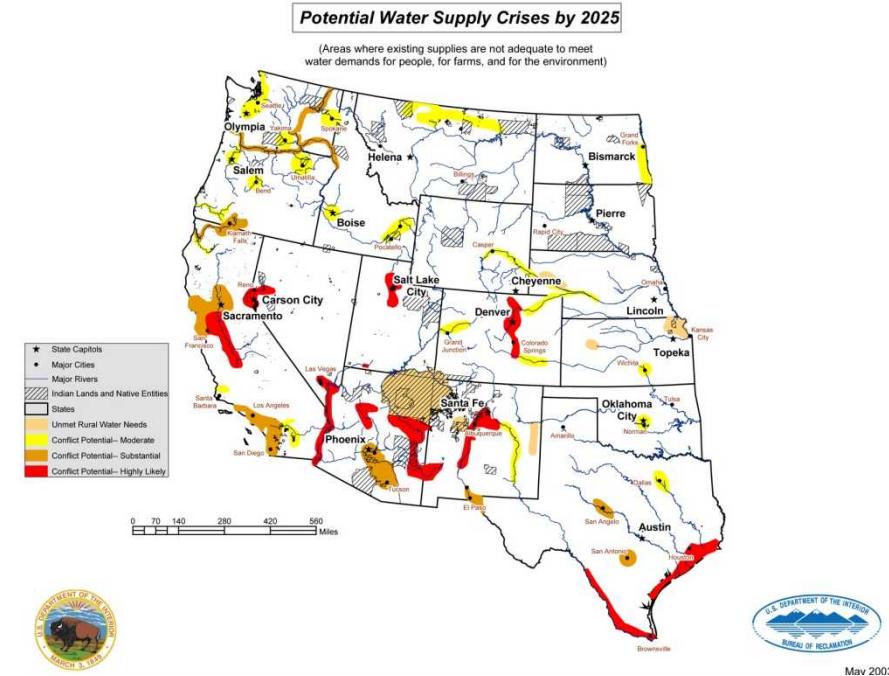

Water Consumption (BGD) 1995

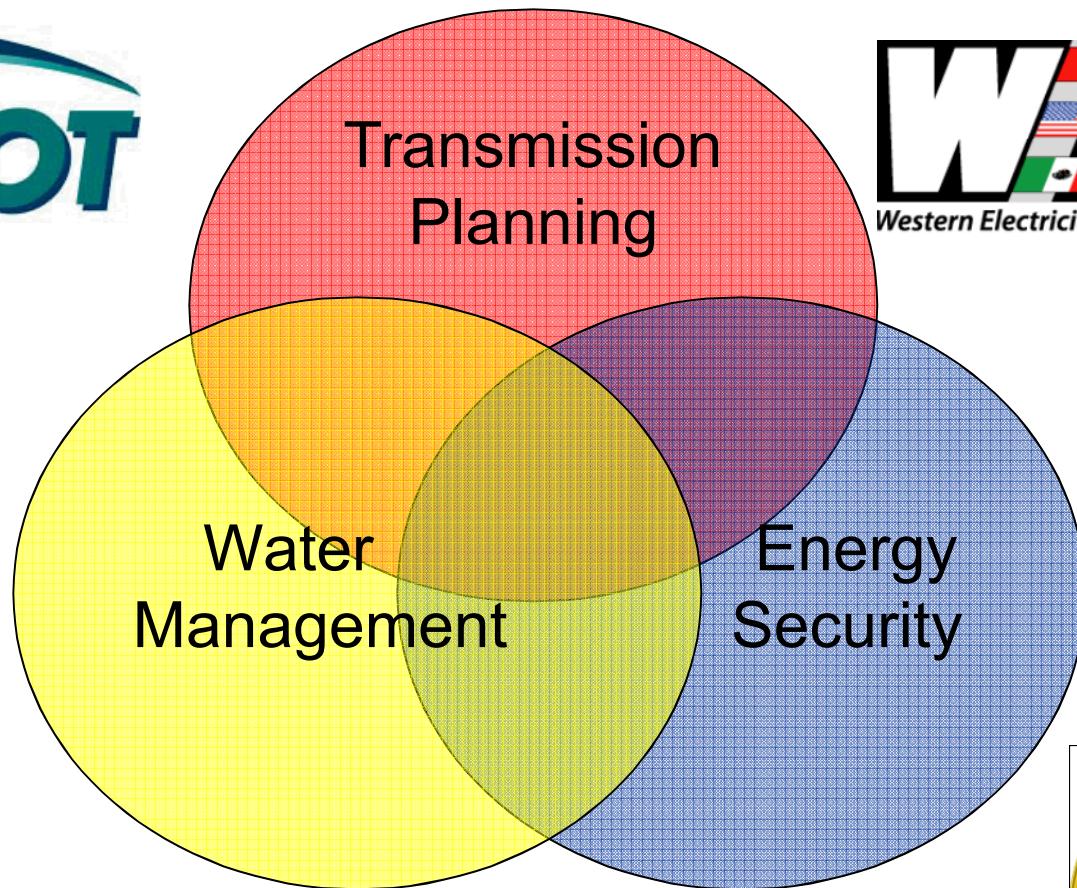

Indications of Water Stress

EPRI, 2003

Integrated Planning

Technical Support Team

- Sandia National Laboratories
 - Vincent Tidwell
 - Barbie Moreland
 - Howard Passell
 - Katie Zemlick
 - Barry Roberts
- Argonne National Laboratory
 - John Gasper
 - Eugene Yan
 - Chris Harto
- Electric Power Research Institute
 - Robert Goldstein
- National Renewable Energy Laboratory
 - Jordan Macknick
 - Kathleen Hallett
- Idaho National Laboratory
 - Gerald Sehlke
 - Dan Jensen
 - Chris Forsgren
- Pacific Northwest National Laboratory
 - Mark Wigmosta
 - Ruby Leung
- University of Texas
 - Michael Webber
 - Carey King

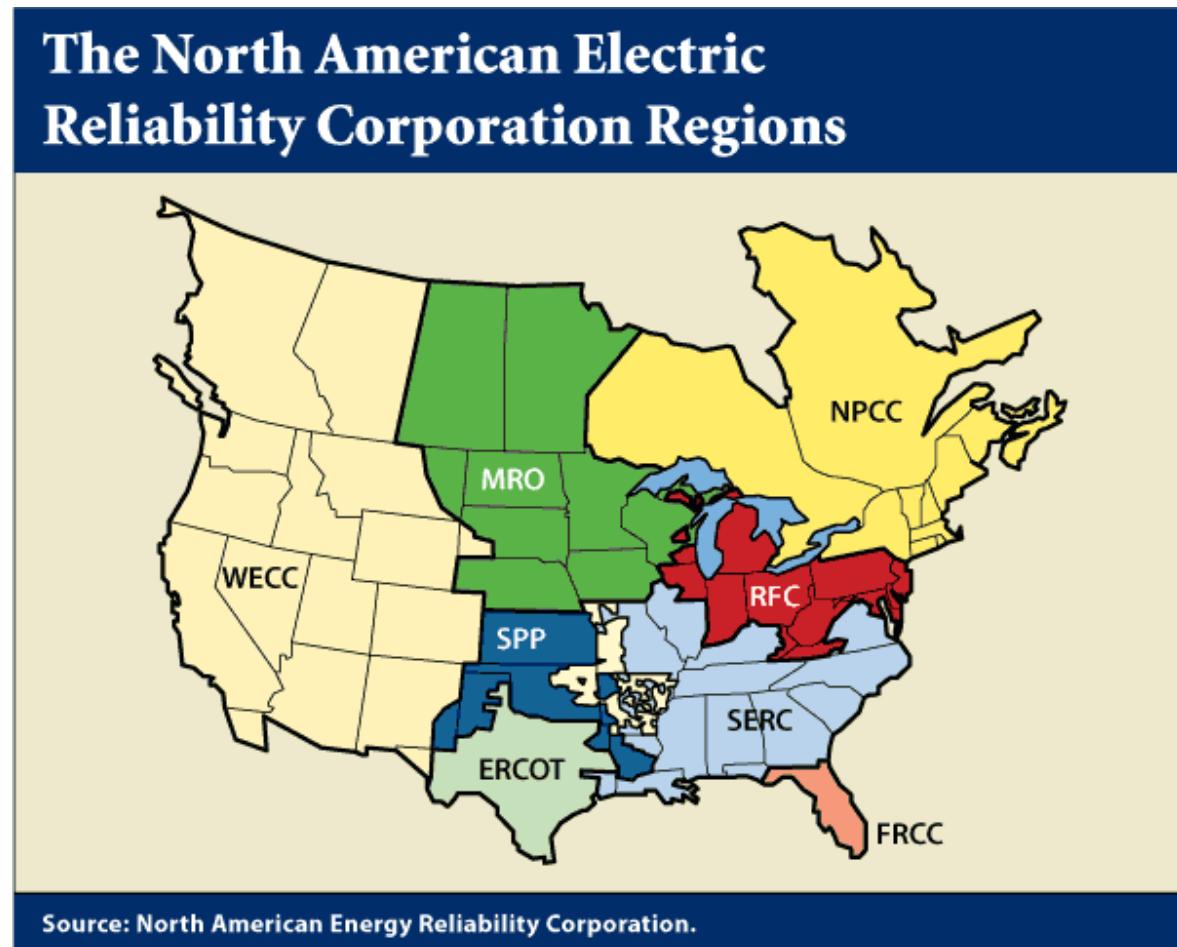

**Sandia
National
Laboratories**

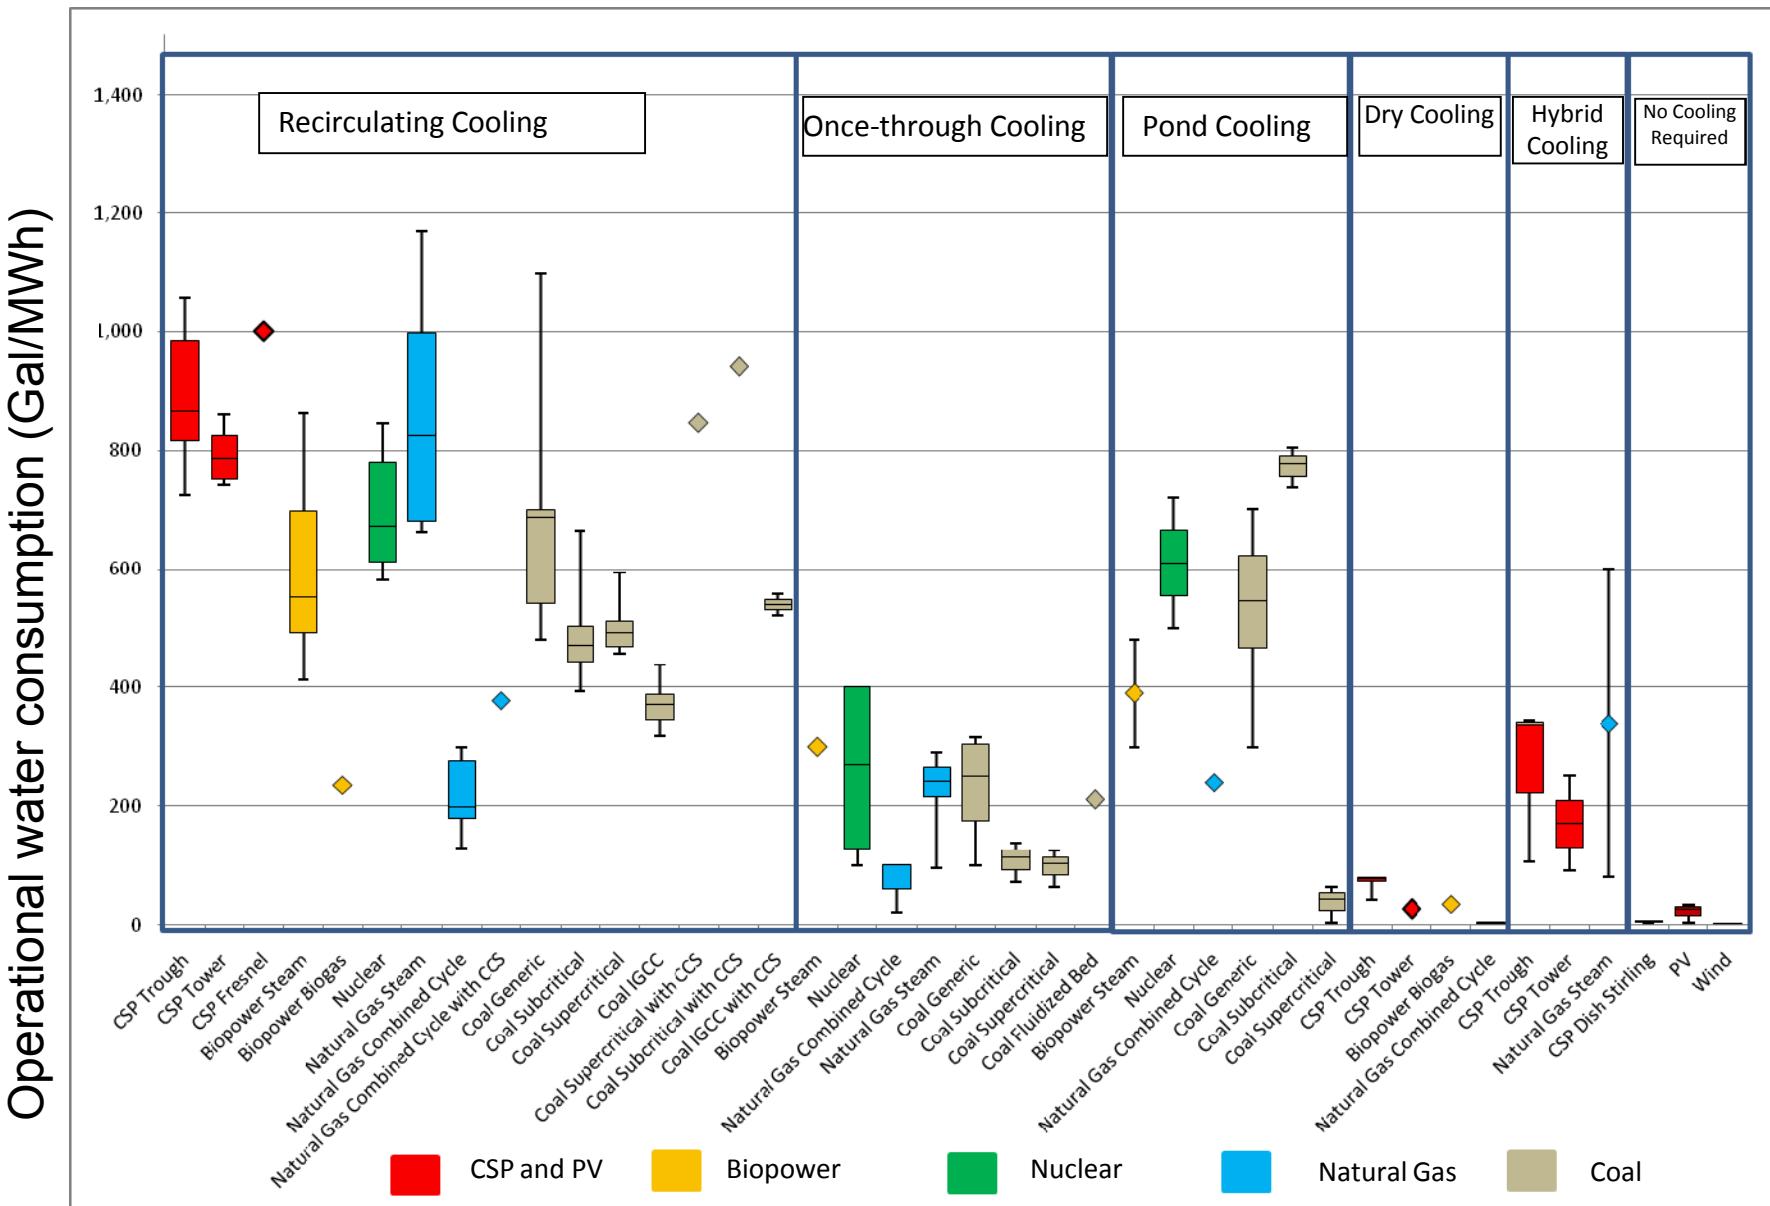

Transmission Planning

- WECC and ERCOT are conducting long-range transmission planning (20 yrs.)
 - Siting of new power plants
 - New transmission capacity

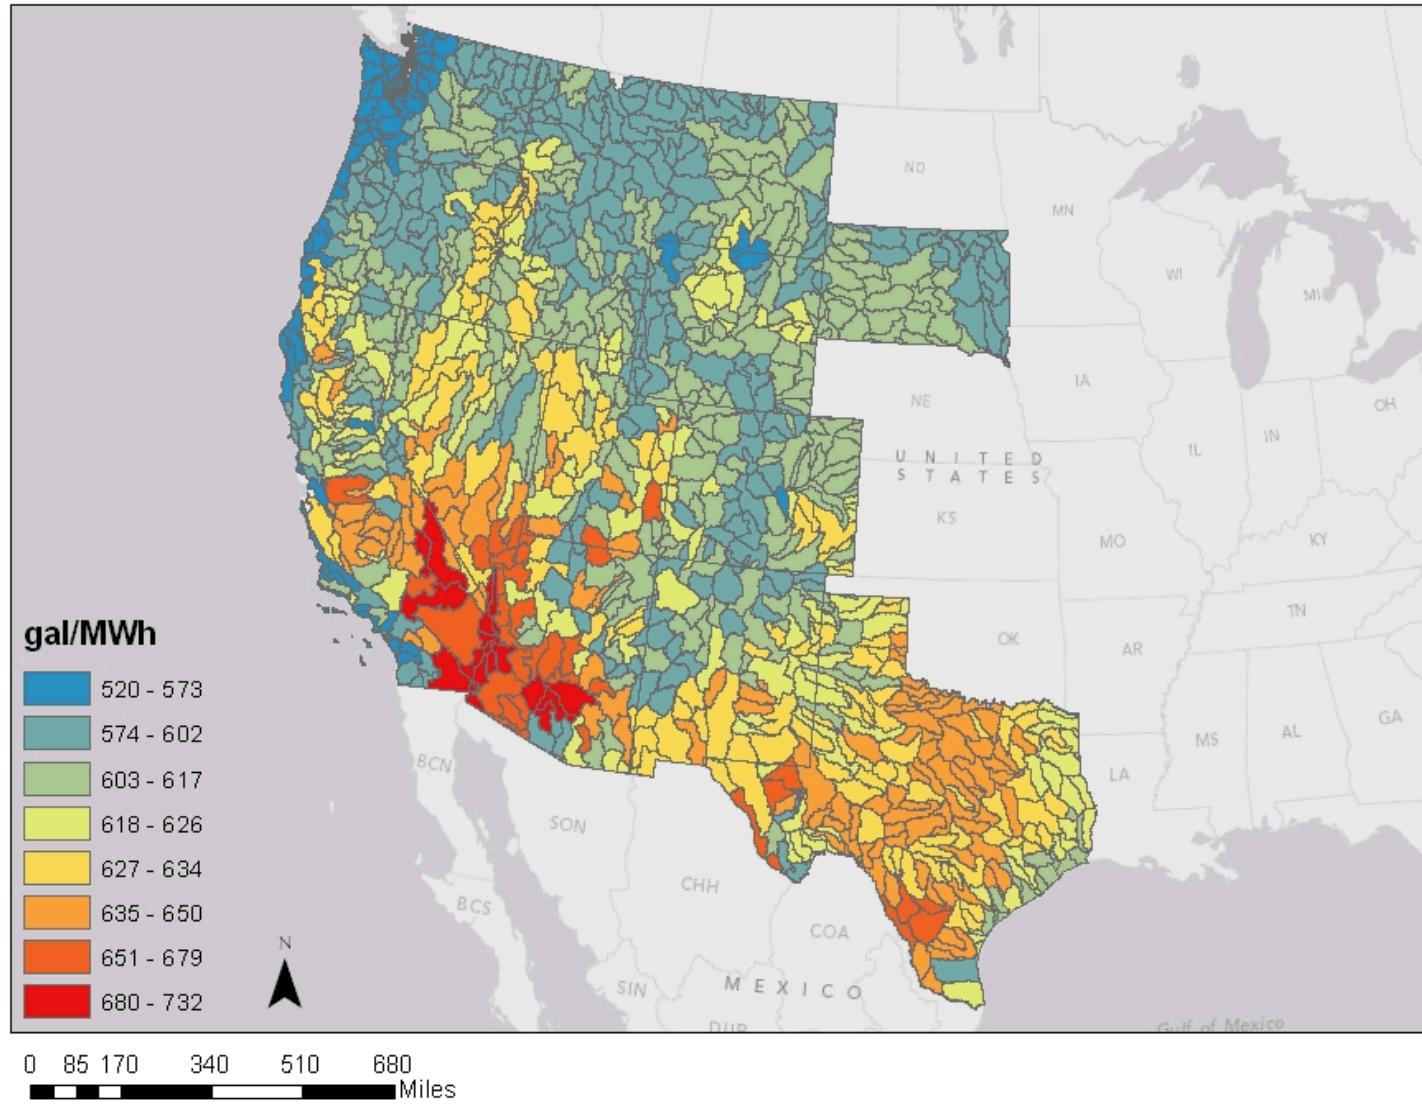

Operational water consumption factors for electricity generating technologies

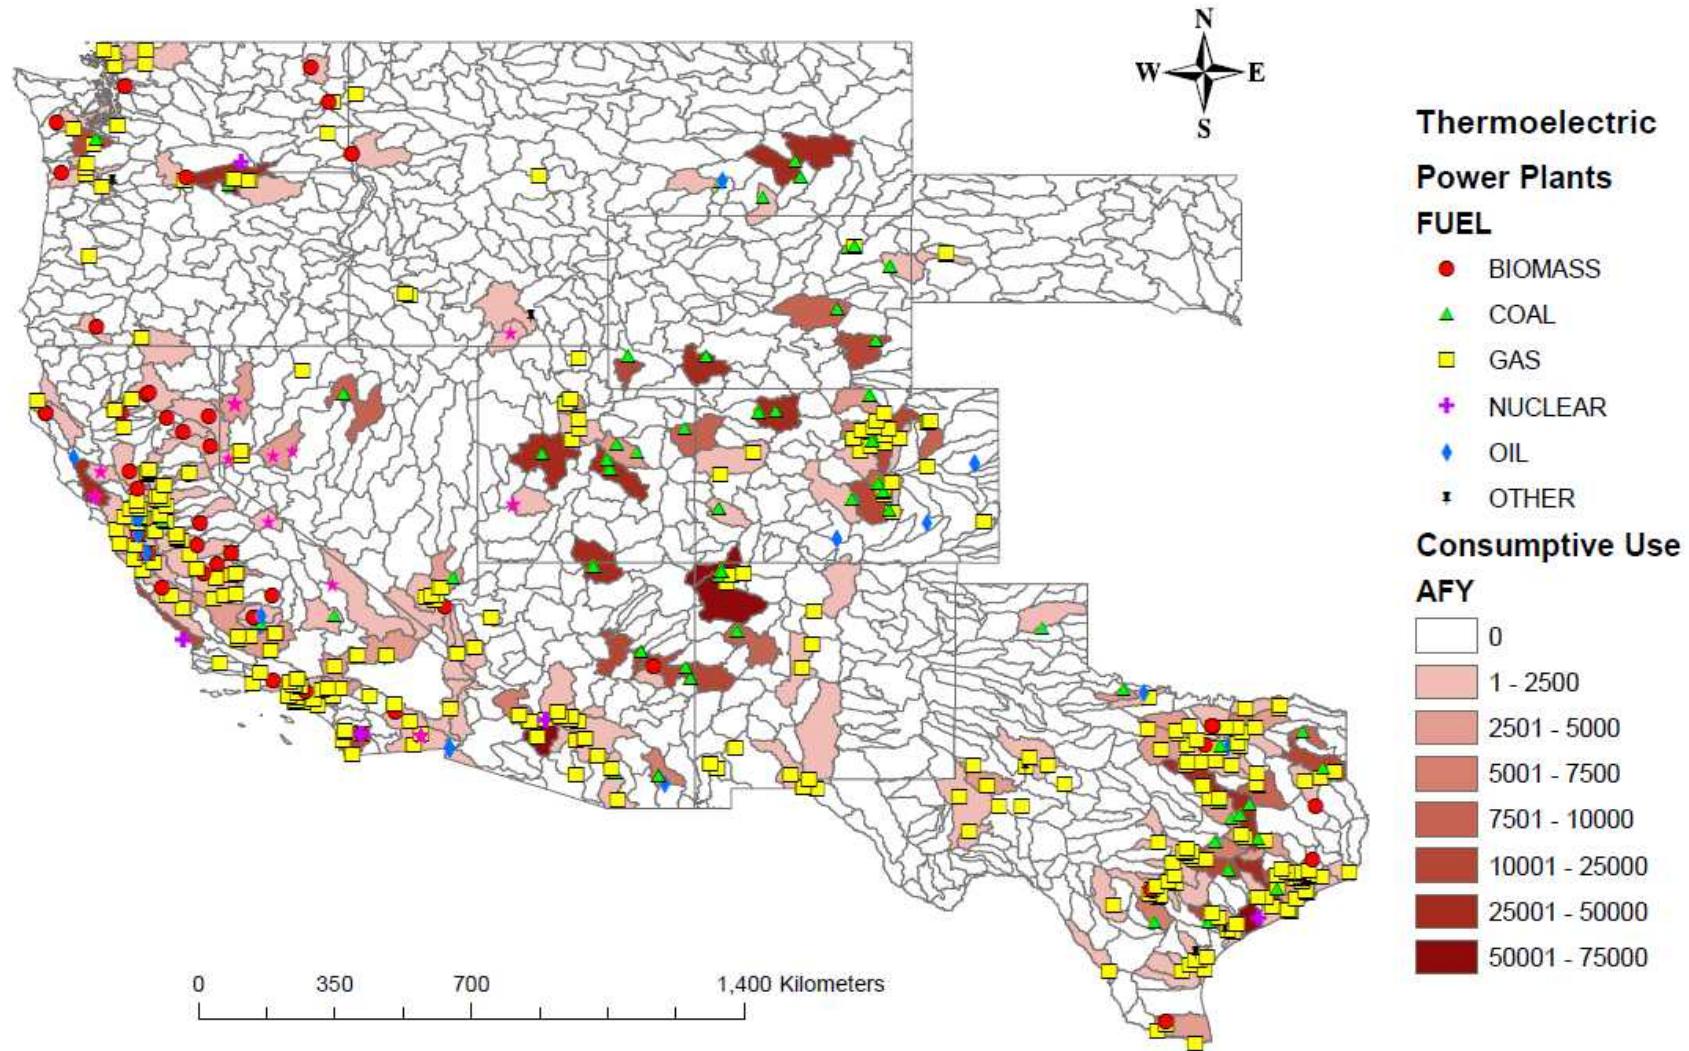

Source: Macknick *et al.* 2011

Coal Plant Water Use (gal/MWh)

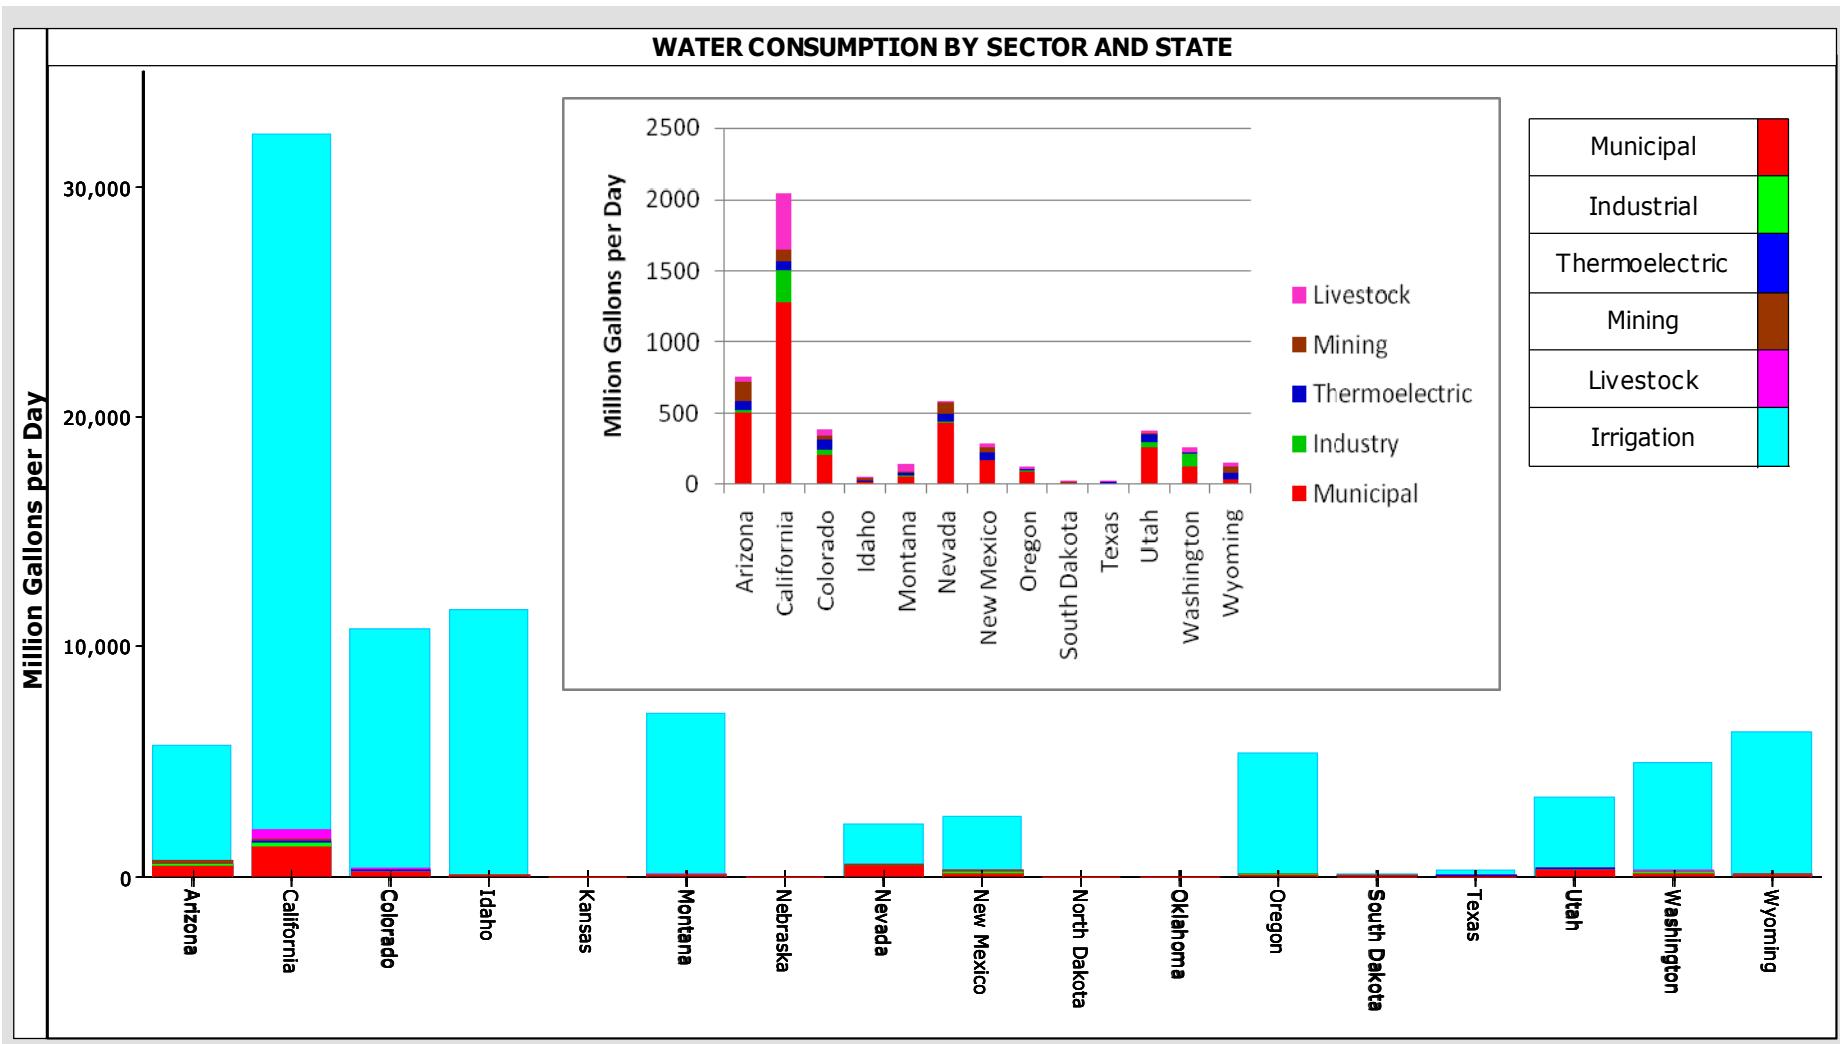

NREL 2012

Thermoelectric Consumptive Use and Power Plants (Current)

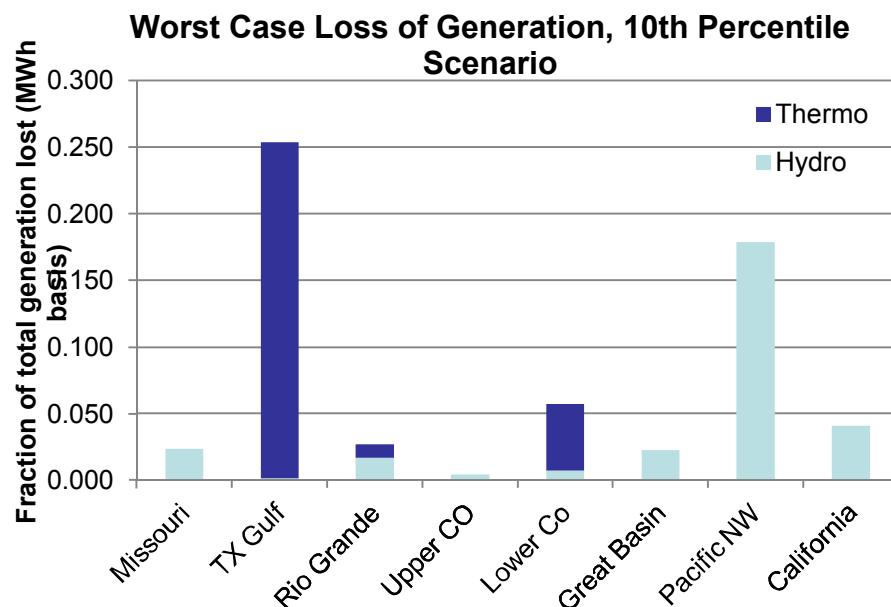

Water Consumption by State and Sector

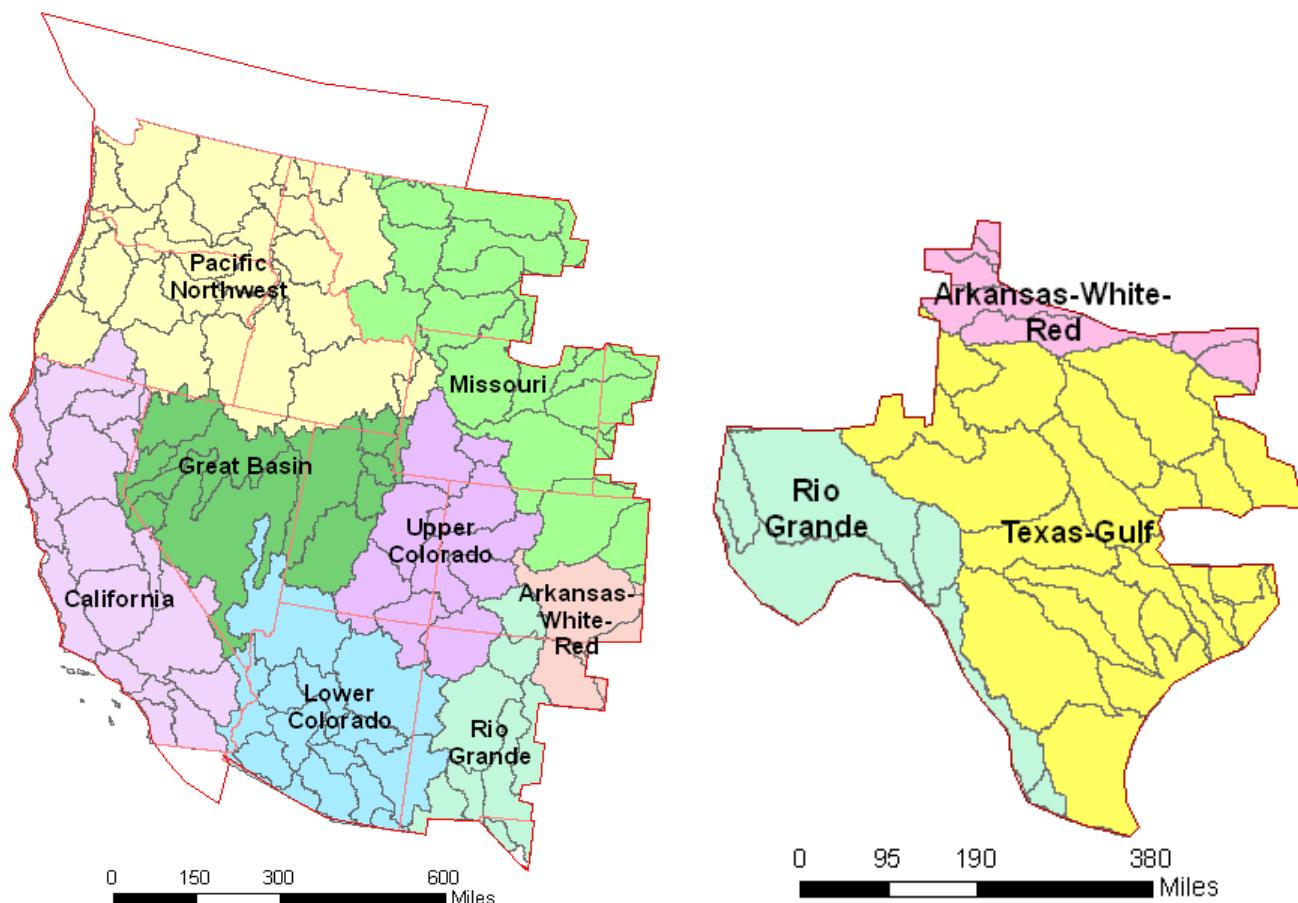

Climate Impact on Existing Plants

	Drought flow vs. recent normal flow (2000-2008)	Drought flow vs. 2010 water demand	Thermoelectric water demand (based on NREL and UT estimates) vs. drought flow	Thermoelectric water demand (Sandia 2010 consumption data) vs. drought flow	Worst case loss of generation from hydro	Worst case loss of total generation from thermoelectric	Total Worst Case Loss of Generation
Missouri	0.67	1.21	0.003	0.005	0.024	0.000	0.024
TX Gulf	0.31	0.66	0.014	0.045	0.002	0.252	0.254
Rio Grande	0.70	0.35	0.000	0.022	0.017	0.010	0.027
Upper CO	0.92	1.31	0.025	0.018	0.004	0.000	0.004
Lower CO	0.77	0.22	0.018	0.048	0.007	0.050	0.057
Great Basin	0.65	1.26	0.006	0.009	0.023	0.000	0.023
Pacific NW	0.74	5.30	0.000	0.000	0.179	0.000	0.179
California	0.65	1.36	0.001	0.001	0.041	0.000	0.041

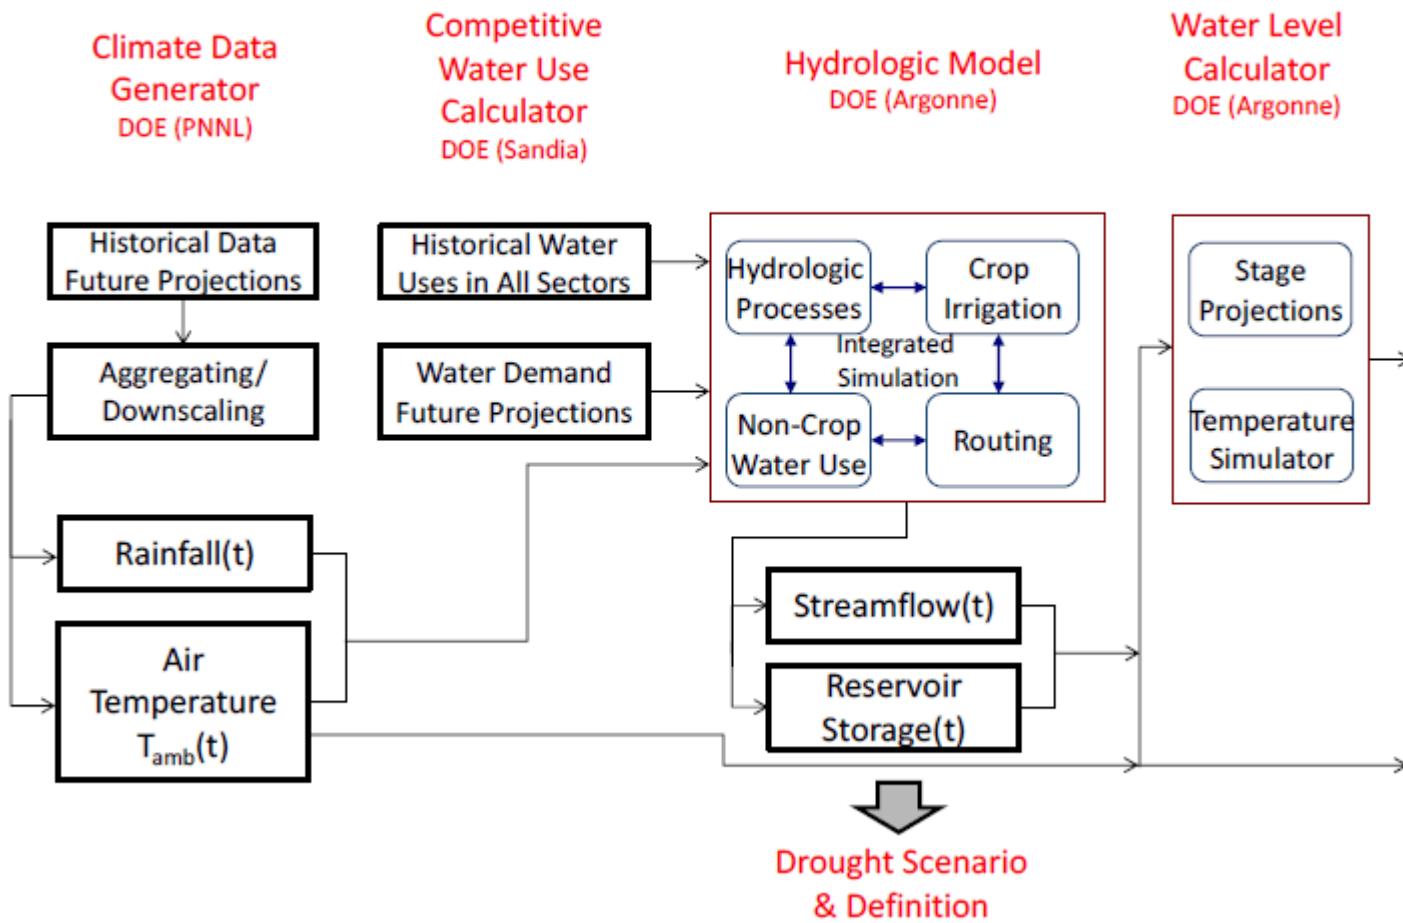

Climate Modeling

- Texas Gulf Coast
- California
- *Pacific Northwest*

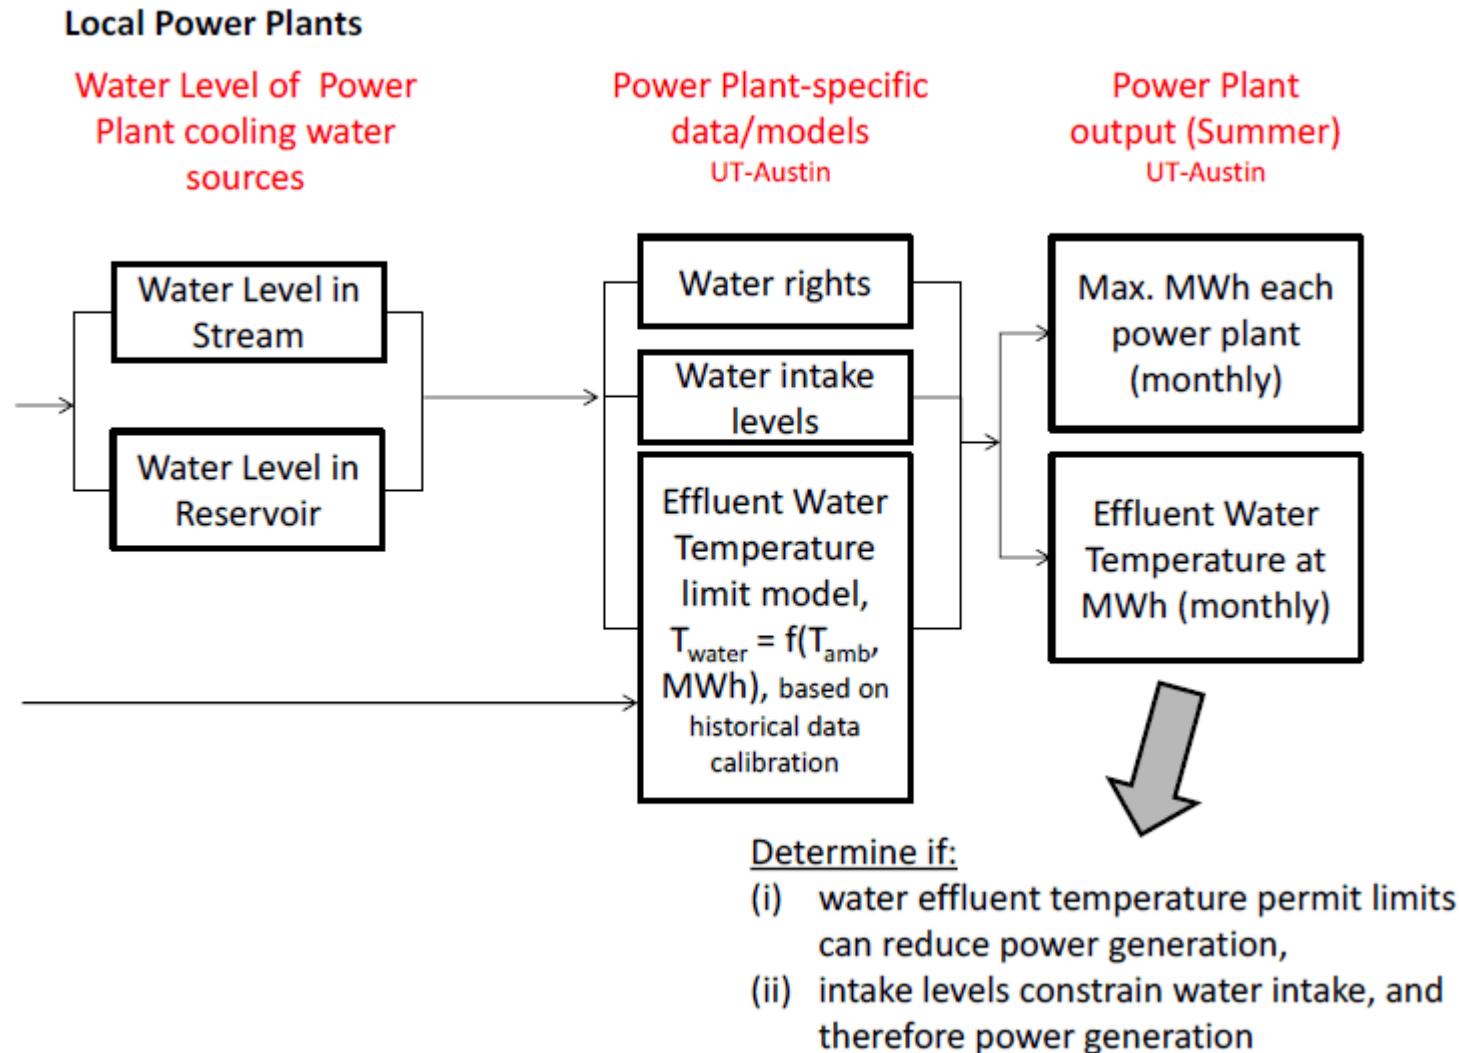

Methods of Analysis (1)

Regional Scale to HUC-8 Basins

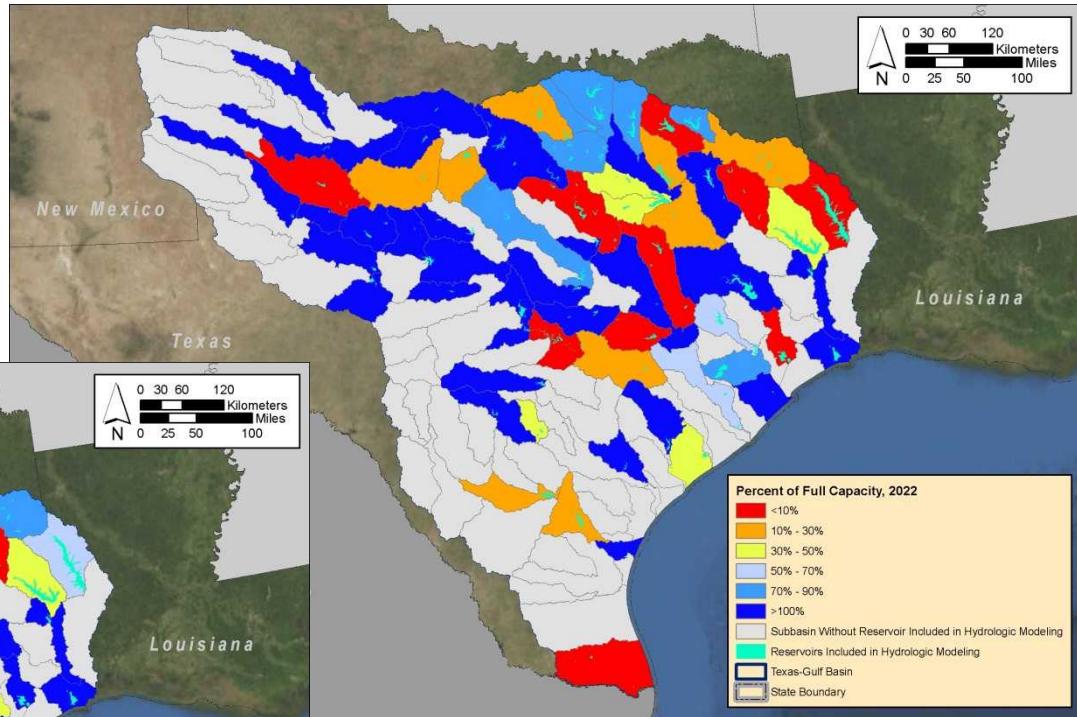

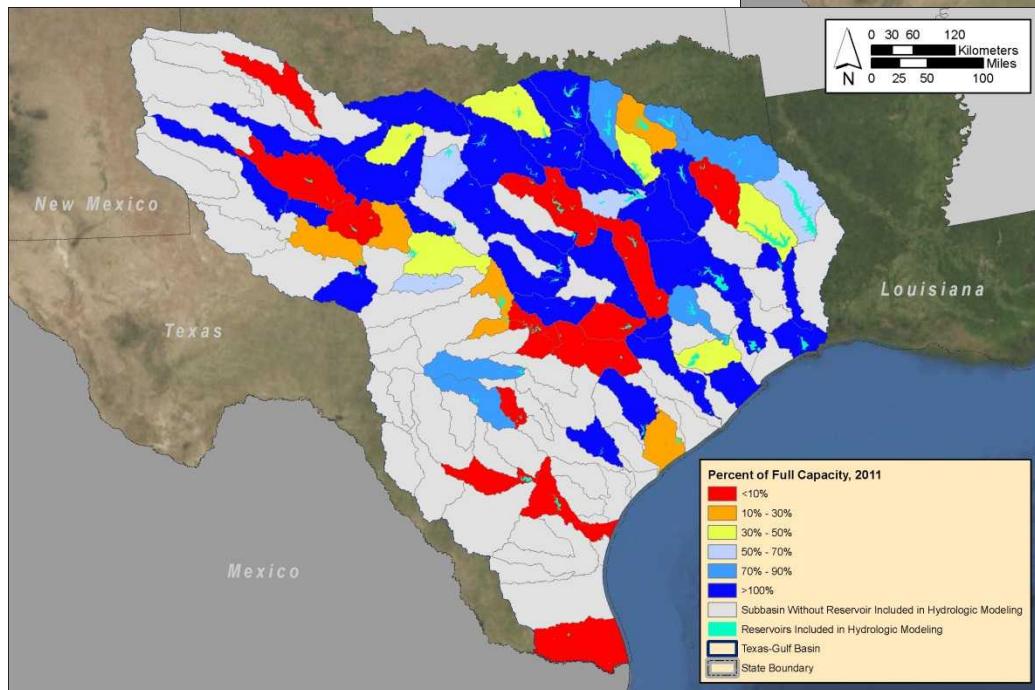

Methods of Analysis (2)

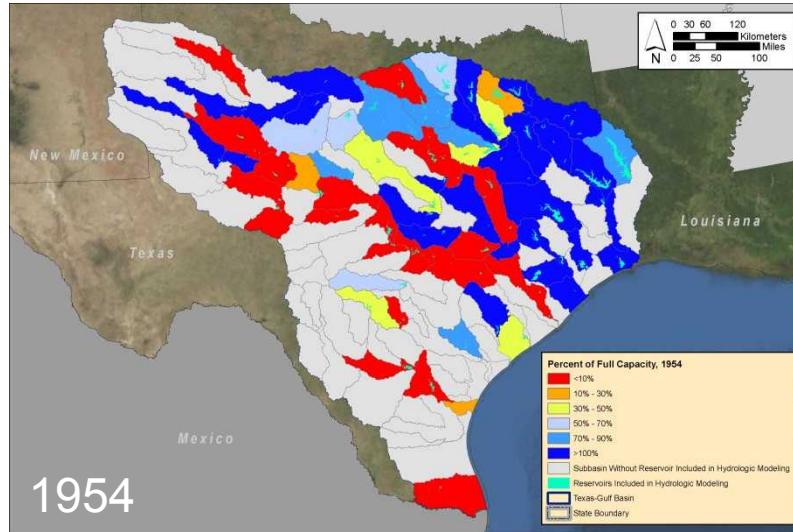

Hydrologic Modeling Results – *Single-Year Drought*

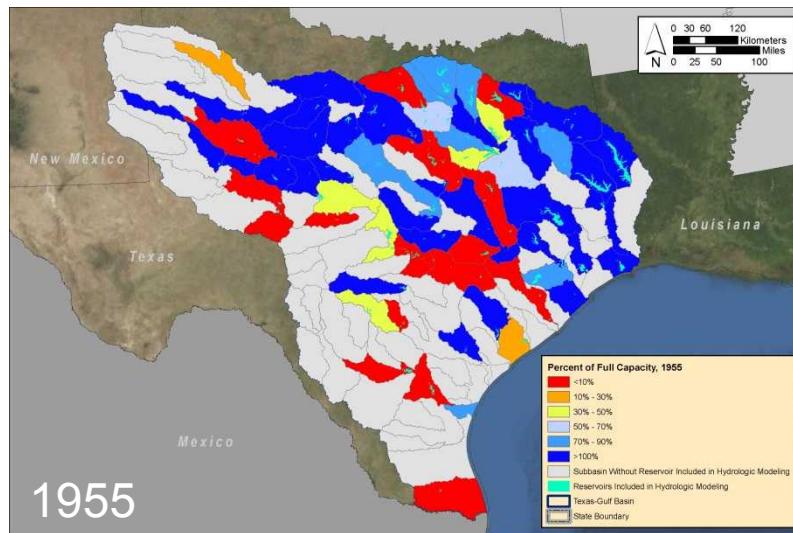

- Projected Reservoir Capacity in HUC-8 Basins

Hydrologic Modeling Results – Multiple-Year Drought

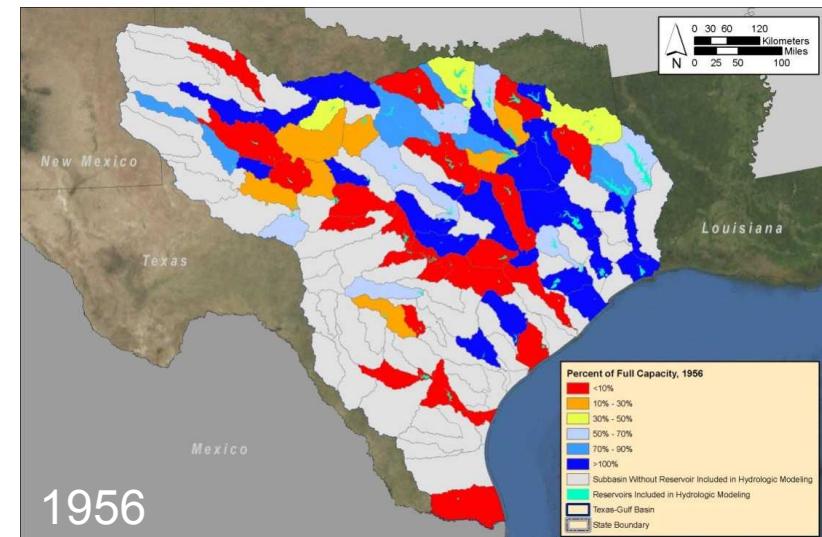

1954

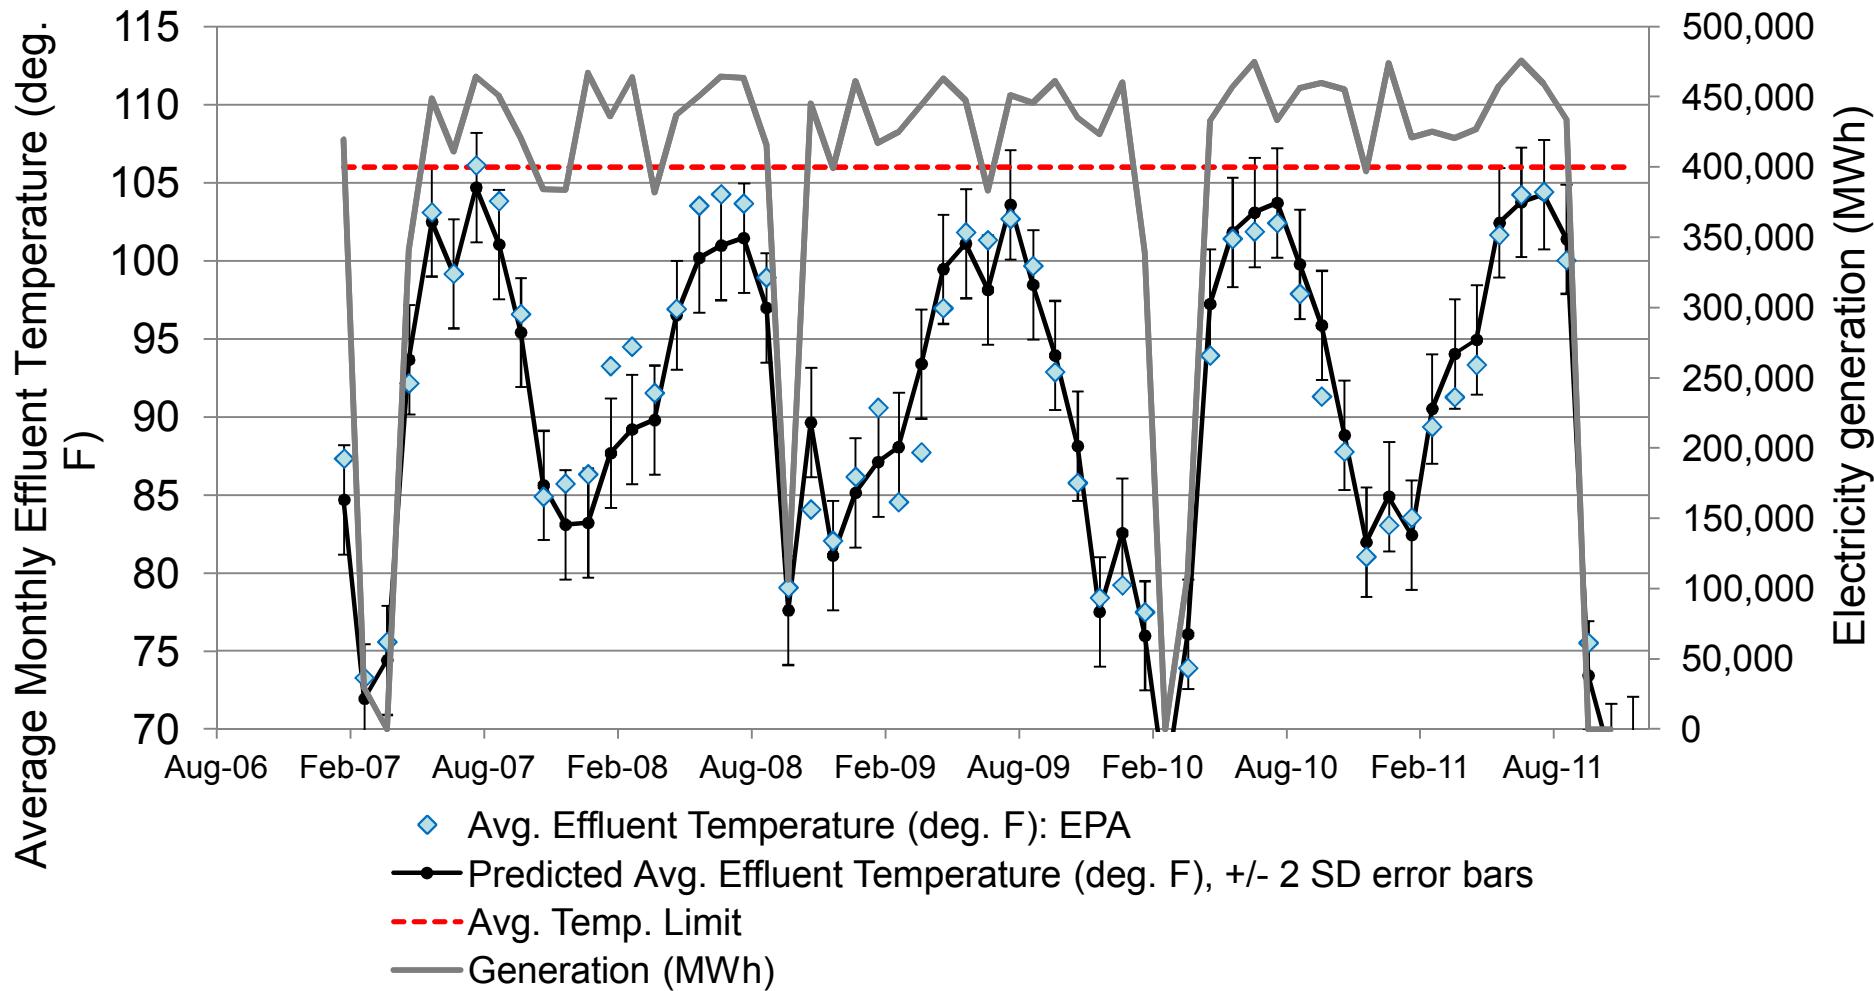

1955

- Projected reservoir storage in HUC-8 basins under 1950-1957 drought scenario

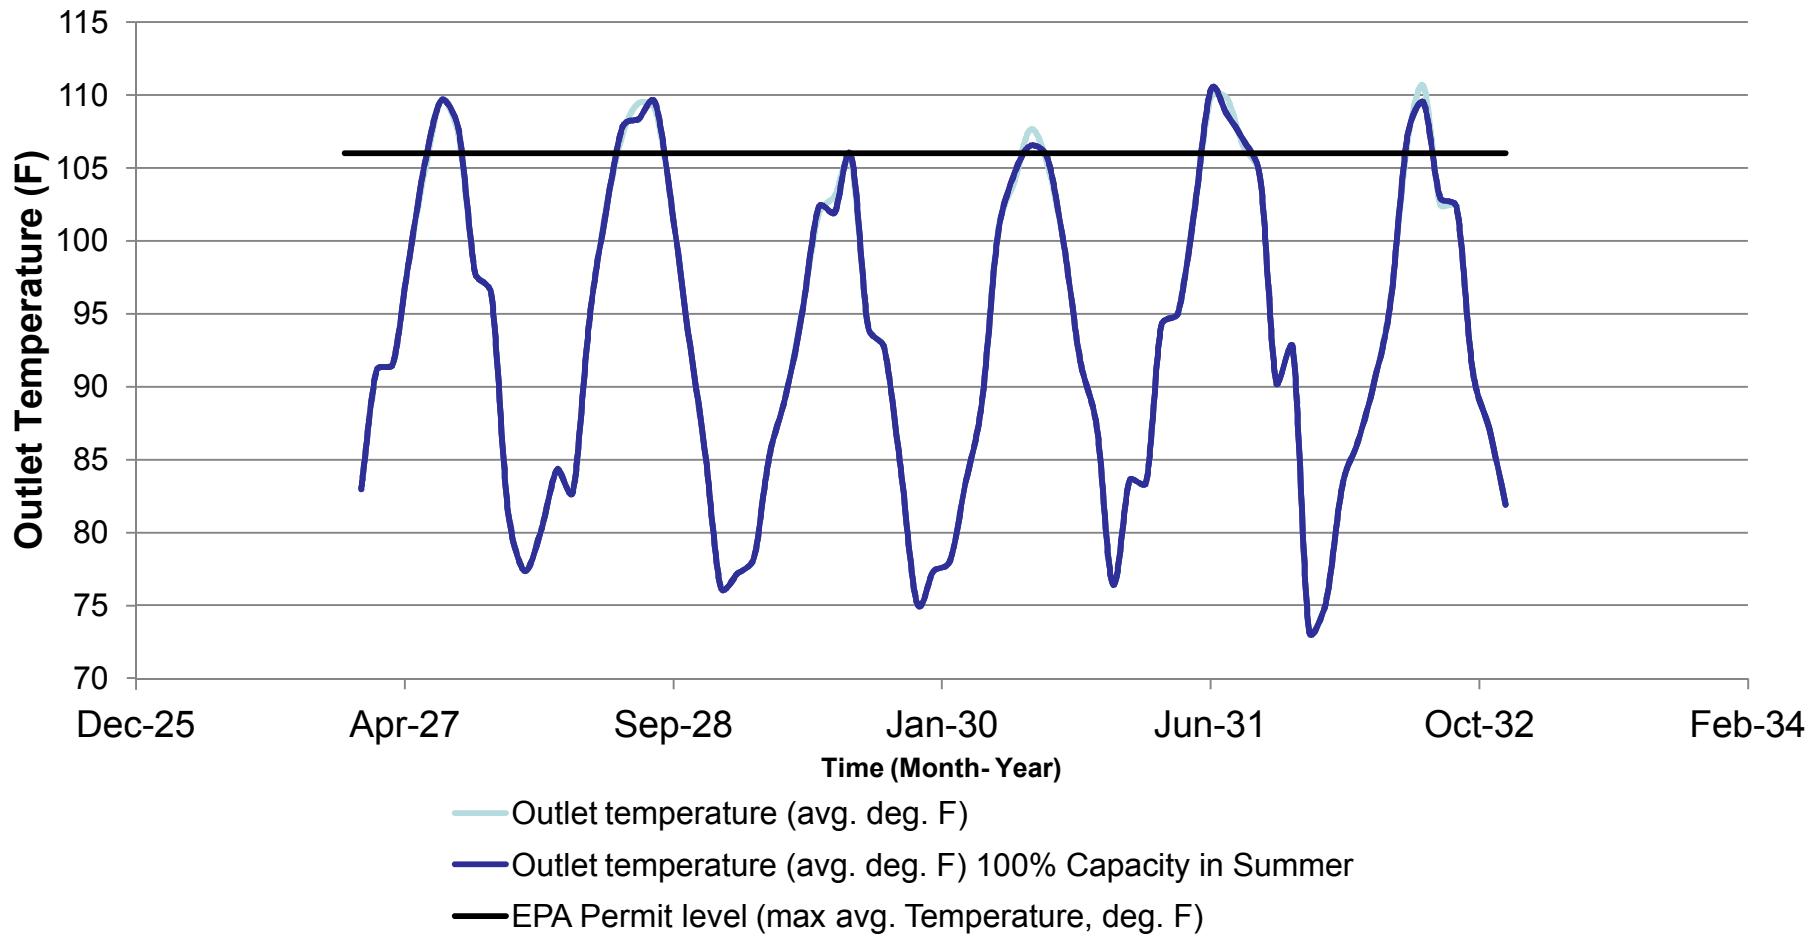

1956

Operations near thermal limit

Operations near thermal limit in future summers

Assuming 2011 generation pattern

Power Plant Siting Decisions

- West-wide objectives
 - Minimize cost
 - Maximize reliability
 - Maximize transmission capacity utilization
 - Limit exposure to policy change
 - ***Minimize stress over water***
- Power plant siting criteria
 - Fuel type
 - Cooling type
 - Capacity
 - Location
 - Water source

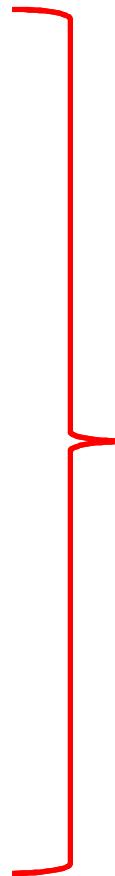

Key Water Sources

- **Potable Water**

- Unappropriated surface water
- Unappropriated groundwater
- Appropriated water (rights transfers)

- **Non-Potable Water**

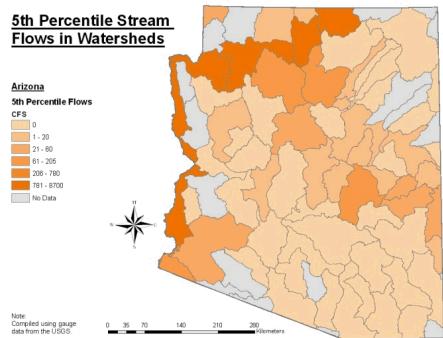

- Municipal/Industrial wastewater
- Shallow brackish water

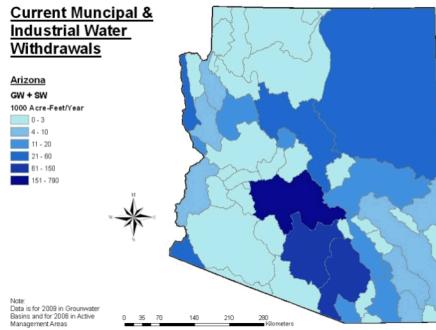

Relative
Availability
and Cost

Utilized State Water Data

Water Supply

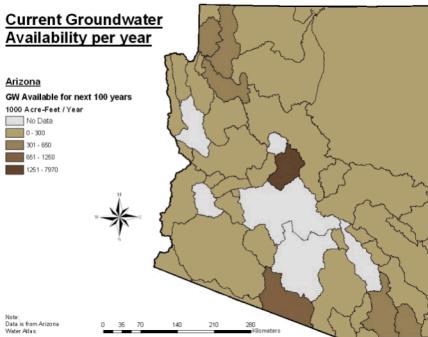

Water Demand

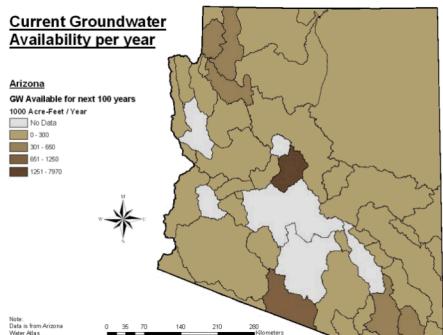

Mean Gauged Streamflow

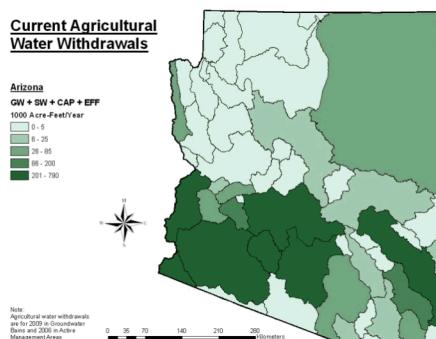

Water Institutions

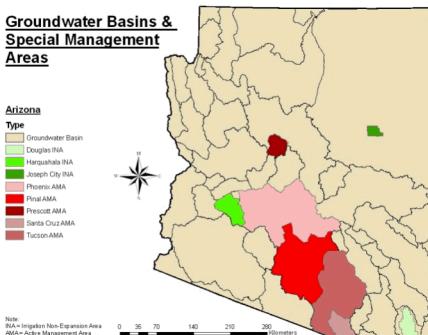

Unappropriated Water

Groundwater Depletion

Irrigation Demand

Administrative Control Areas

Overcoming Multiple Reference Systems

Data available from variety of sources

- State water plans
- State and basin-level data
- USGS
- USDA
- EPA

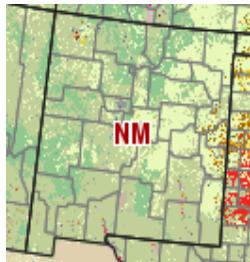

Multiple data formats and levels of detail

Points: wells, population centroids, wastewater plants, stream gages

Polygons: Counties, water management areas, groundwater basins

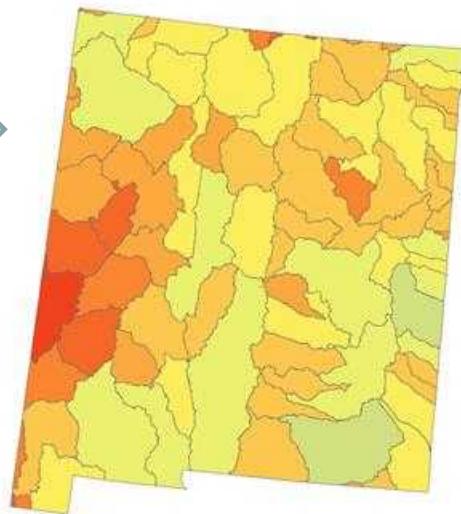

Raster: irrigated agriculture, groundwater recharge

Documents: water plans, population projections, time-dependent data

Scaled to HUC-8 boundary

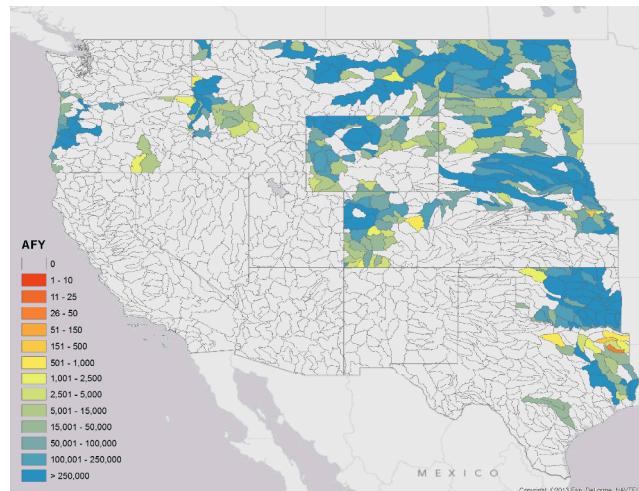

Metric Development

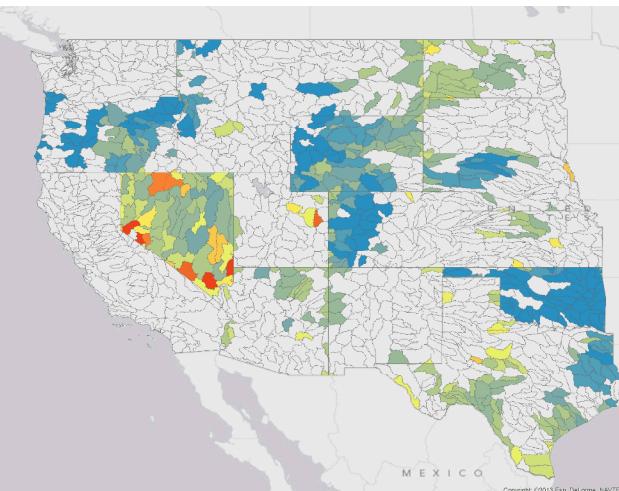

- Data on “available water” are rare
- As such, metrics were estimated from available information
- Assisted by volunteer team from WSWC
 - Bret Bruce (USGS)
 - Dan Hardin (TX)
 - Sara Larsen (WSWC)
 - Dave Mitamura (TX)
 - Andy Moore (CO)
 - Ken Stahr (OR)
 - Todd Stonely (UT)
 - Steve Wolff (WY)
 - Dwane Young (WSWC)

Water Availability

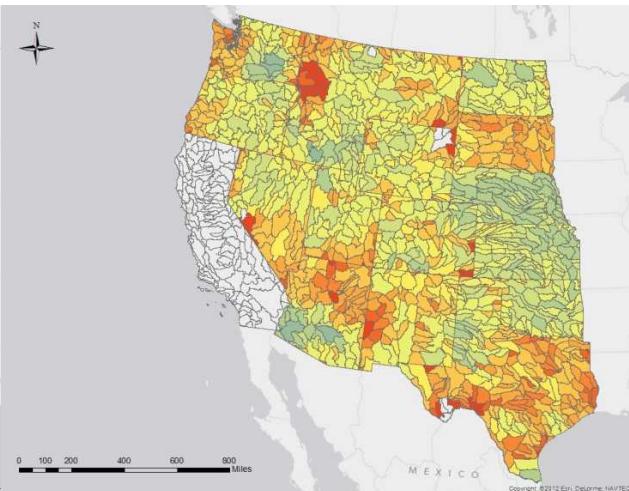

Unappropriated Surface Water

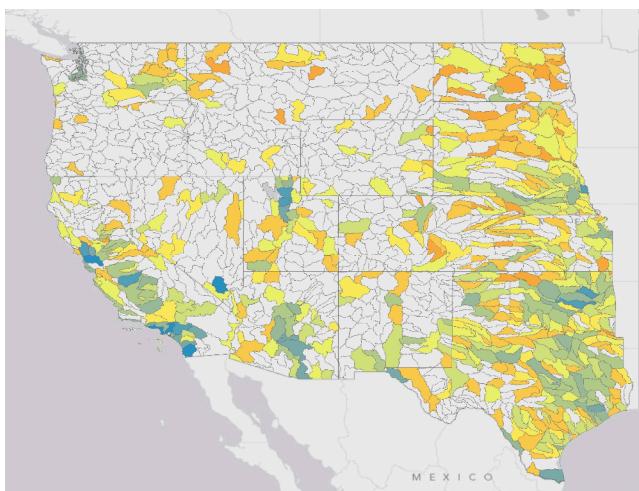

Unappropriated Groundwater

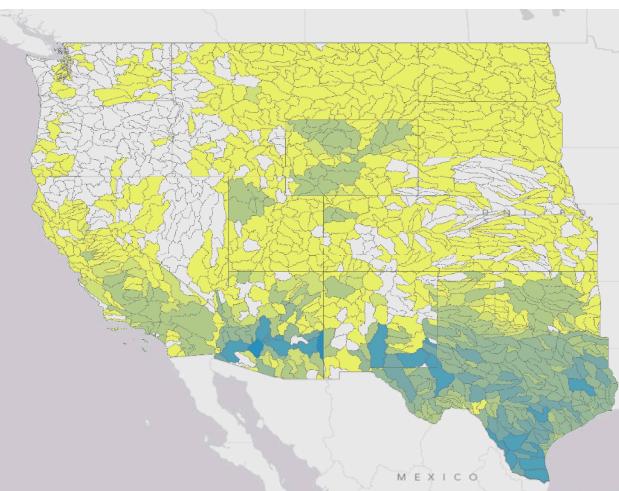

Appropriated Water

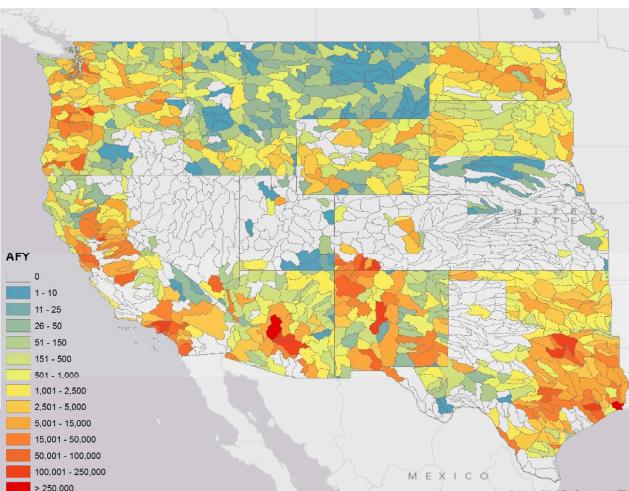

Municipal Wastewater

Brackish Groundwater

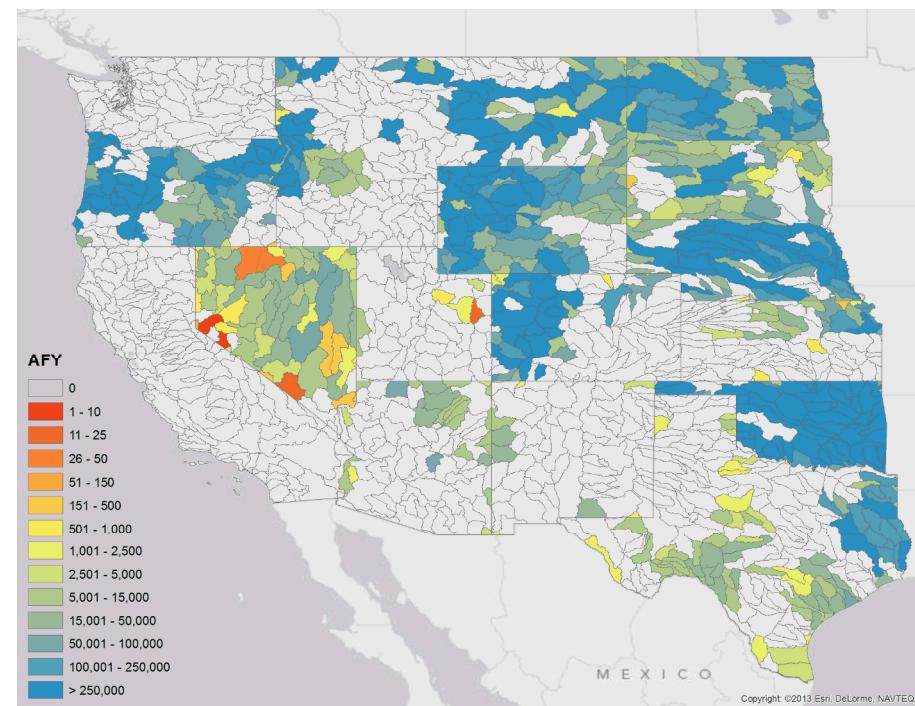

Consumptive Demand 2010-2030

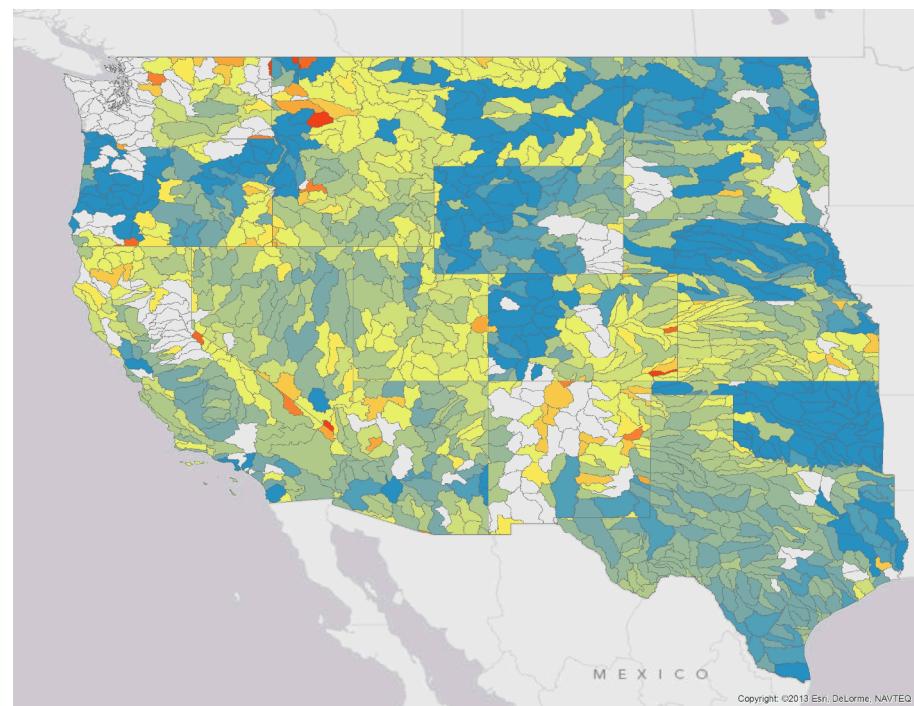

Water for Development

Unappropriated Water Sources – Change in Demand 2030

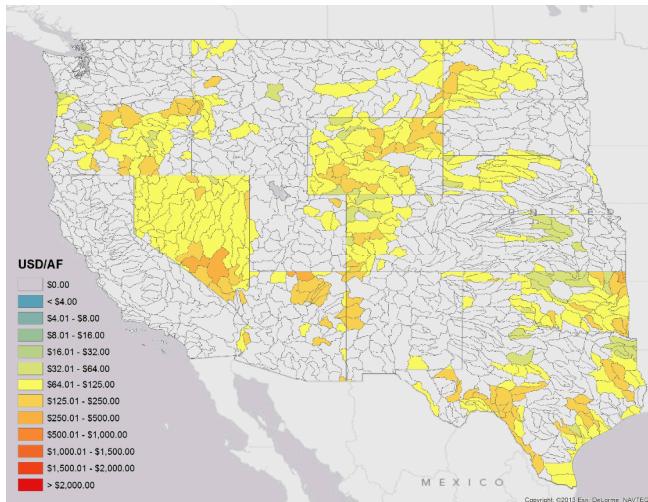

All Water Sources – Change in Demand 2030

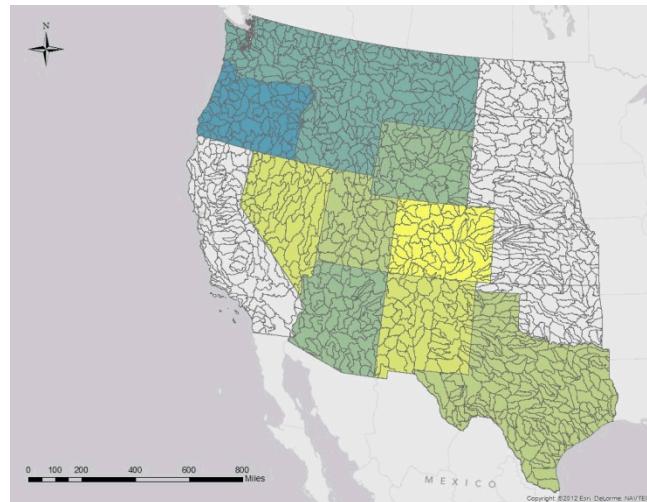

Relative Cost of Water

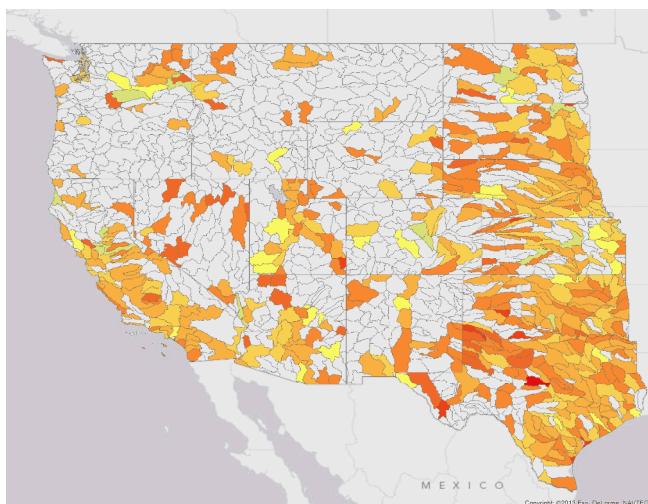

Unappropriated Groundwater

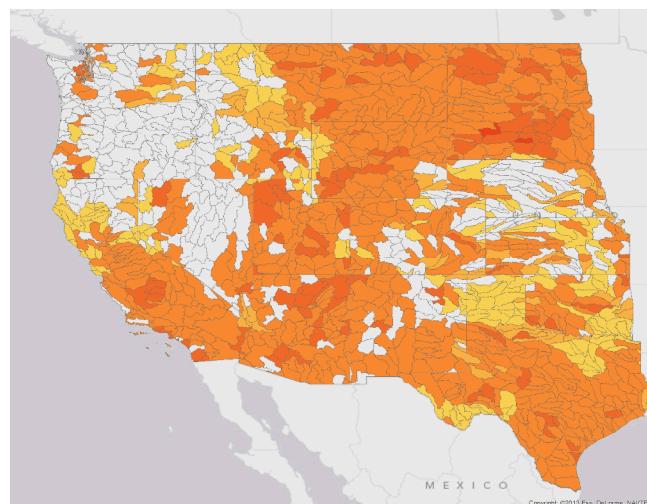

Appropriated Water

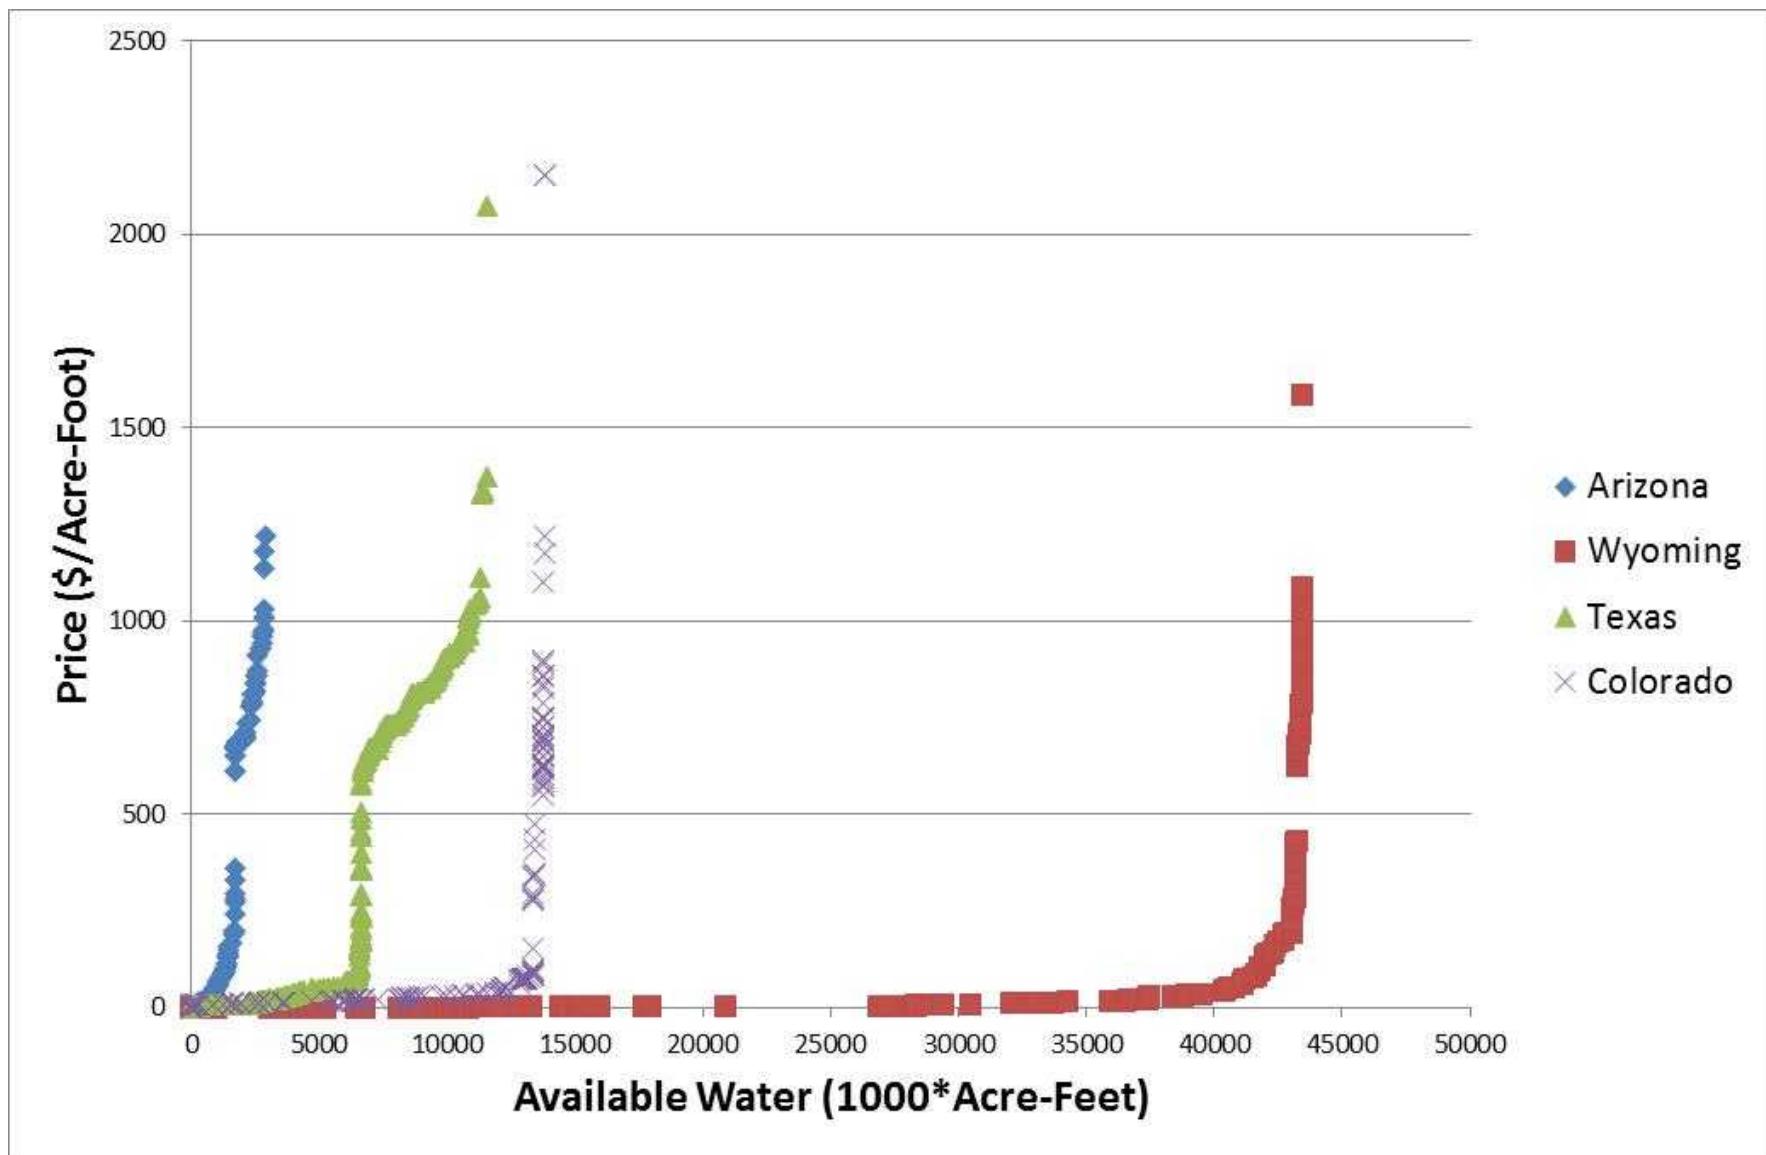

Municipal Wastewater

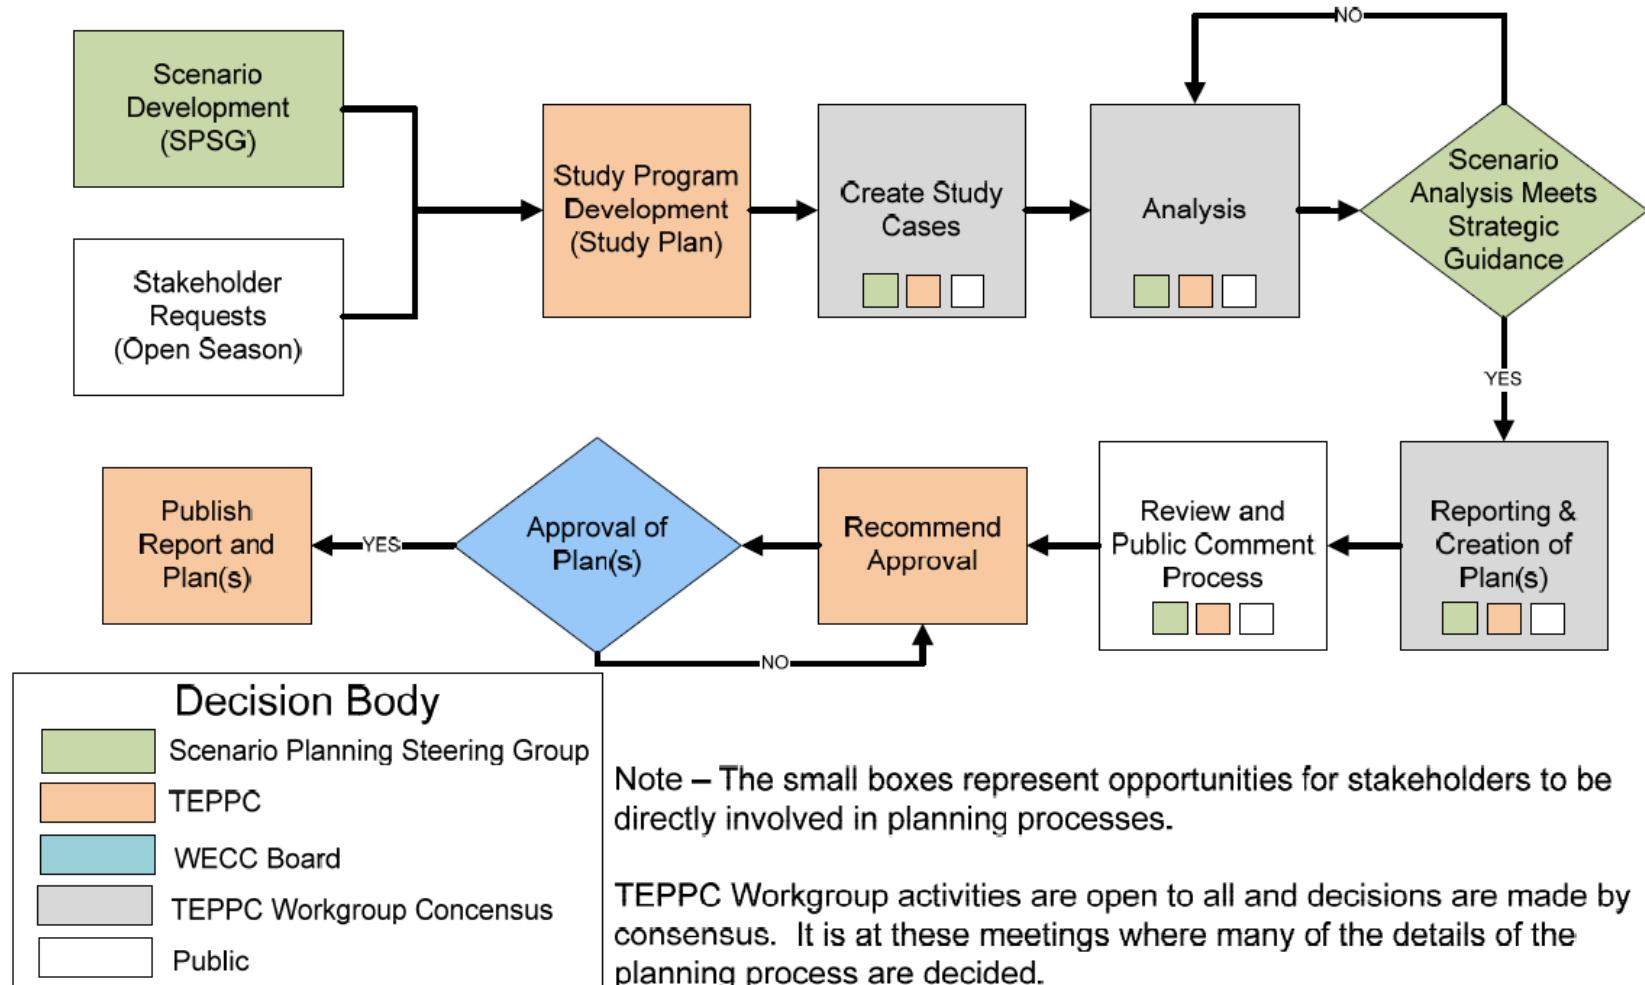

Brackish Groundwater

State-Level Supply Curves

Transmission Planning

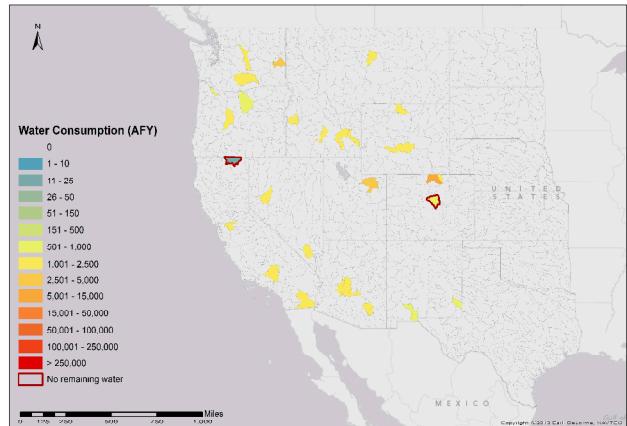

Long Range Planning Results

Case Description	Water Limited Watersheds	Number of New Units	Total Water Consumption (AFY)
Reference Case	2	59	53,128
Scenario 1 - Focus on Economic Recovery	3	106	106,808
Scenario 2 - Focus on Clean Energy	6	46	51,527
Scenario 3 - Focus on Short-Term Consumer Costs	2	108	108,203
Scenario 4 - Focus on Long-Term Societal Costs	1	43	38,637
Sensitivity - \$0/ton CO2 Tax	6	124	124,907
Sensitivity - \$2/MMbtu Natural Gas price	3	164	170,269
Sensitivity - \$12/MMbtu Natural Gas price	1	11	34,462
Sensitivity - \$75/ton CO2 Tax	5	131	133,674
Study Request - Enhanced Geothermal Breakthrough	4	20	19,230

Long Range Planning Results

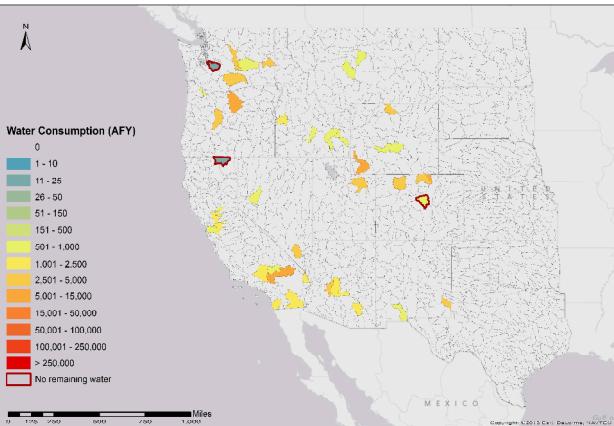

Reference Case

Total water demand (AFY) and areas where demand exceeds availability (red)

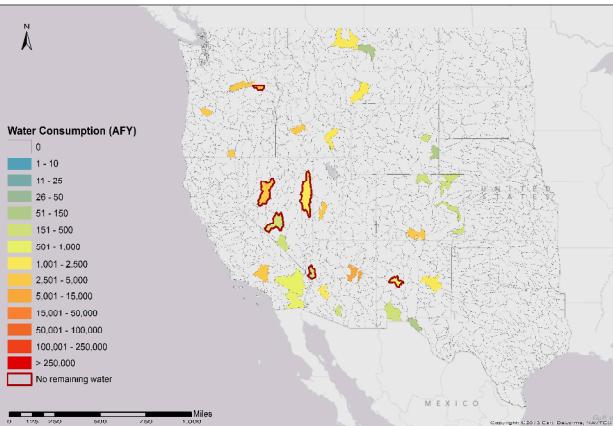

Scenario 1: Focus on Economic Recovery

Total water demand (AFY) and areas where demand exceeds availability (red)

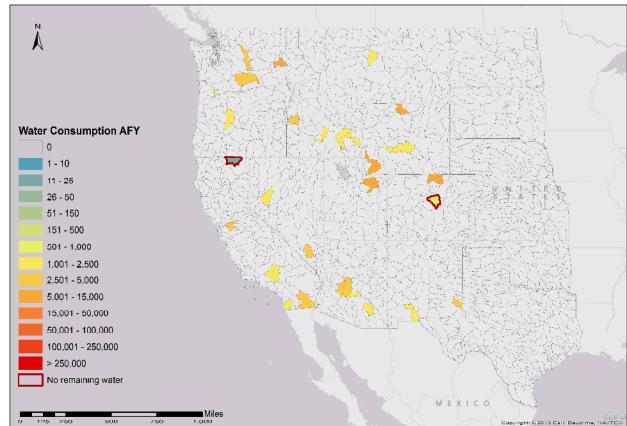

Scenario 2: Focus on Clean Energy

Total water demand (AFY) and areas where demand exceeds availability (red)

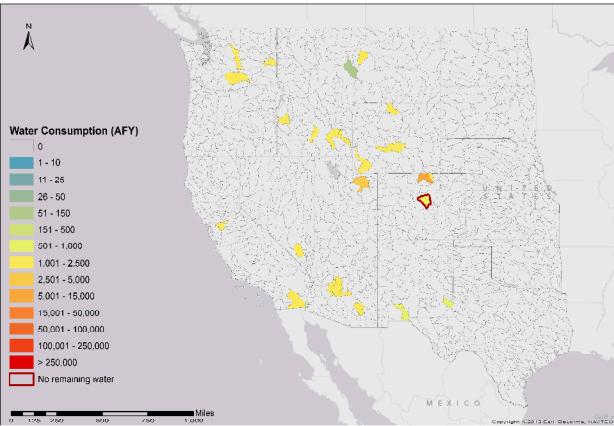

Scenario 3: Focus on Short-Term Consumer Costs

Total water demand (AFY) and areas where demand exceeds availability (red)

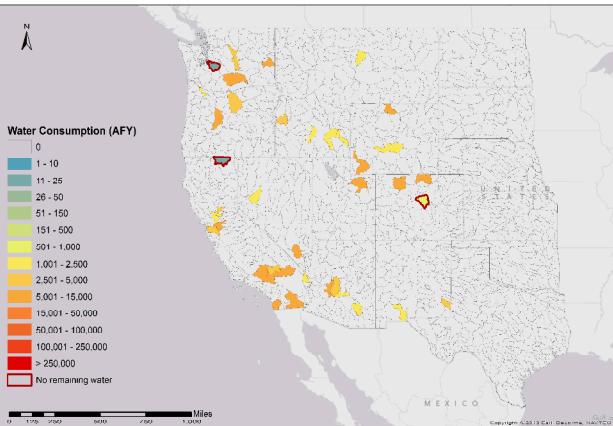

Scenario 4: Focus on Long-Term Societal Costs

Total water demand (AFY) and areas where demand exceeds availability (red)

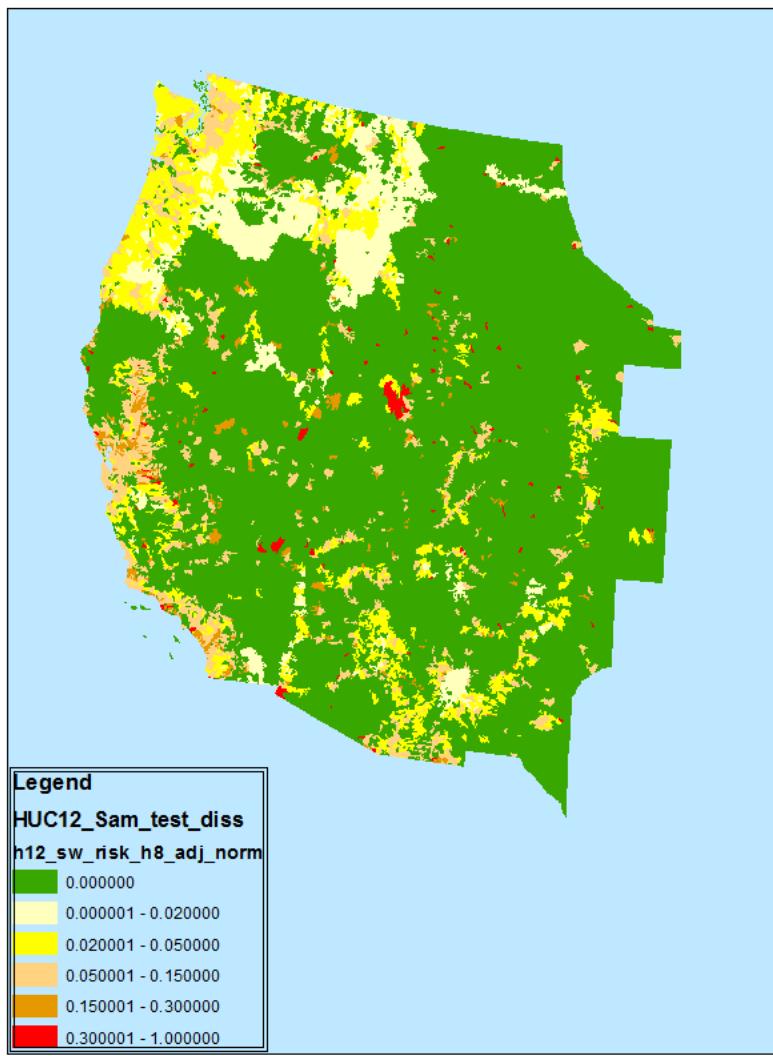

Sensitivity Analysis: \$2/MMbtu Natural Gas Price

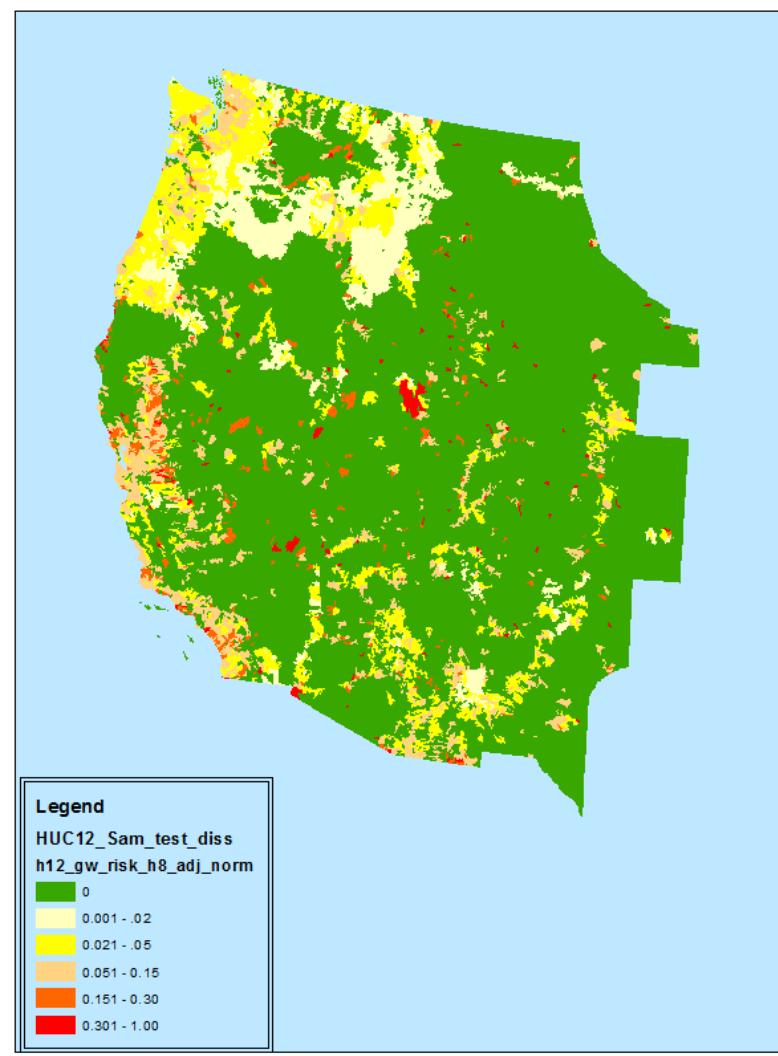

Total water demand (AFY) and areas where demand exceeds availability (red)

HUC-12 Risk Map (From Surface Withdrawals)

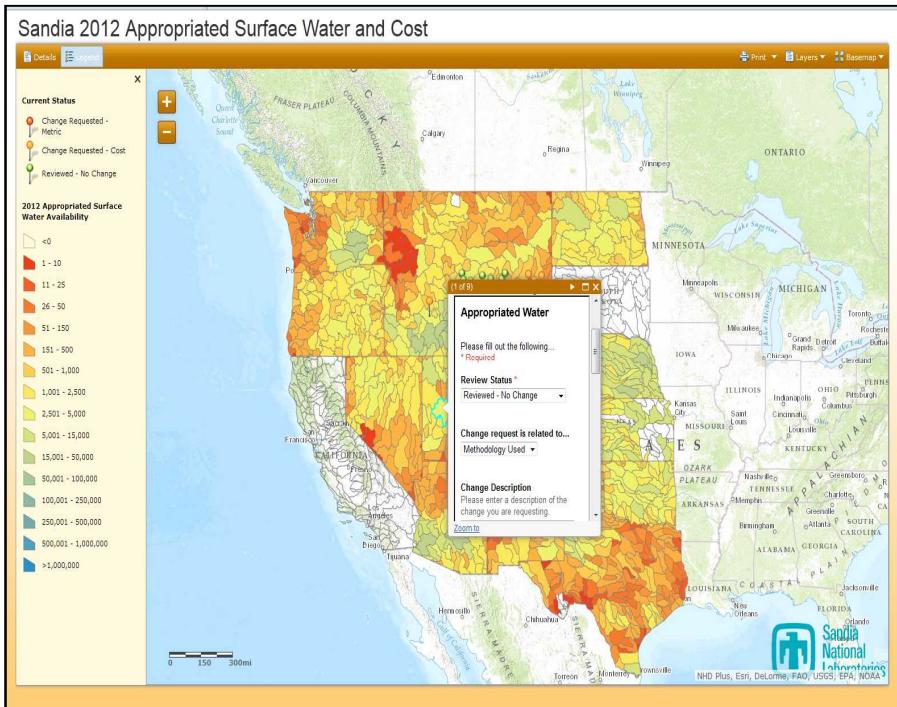

HUC-12 Risk Map (From Underground Withdrawals)

Data review

ArcGIS Online site

Reviewers select metric map by water source and make comments/revisions by watershed. Changes are tracked with pins on map and in a spreadsheet.

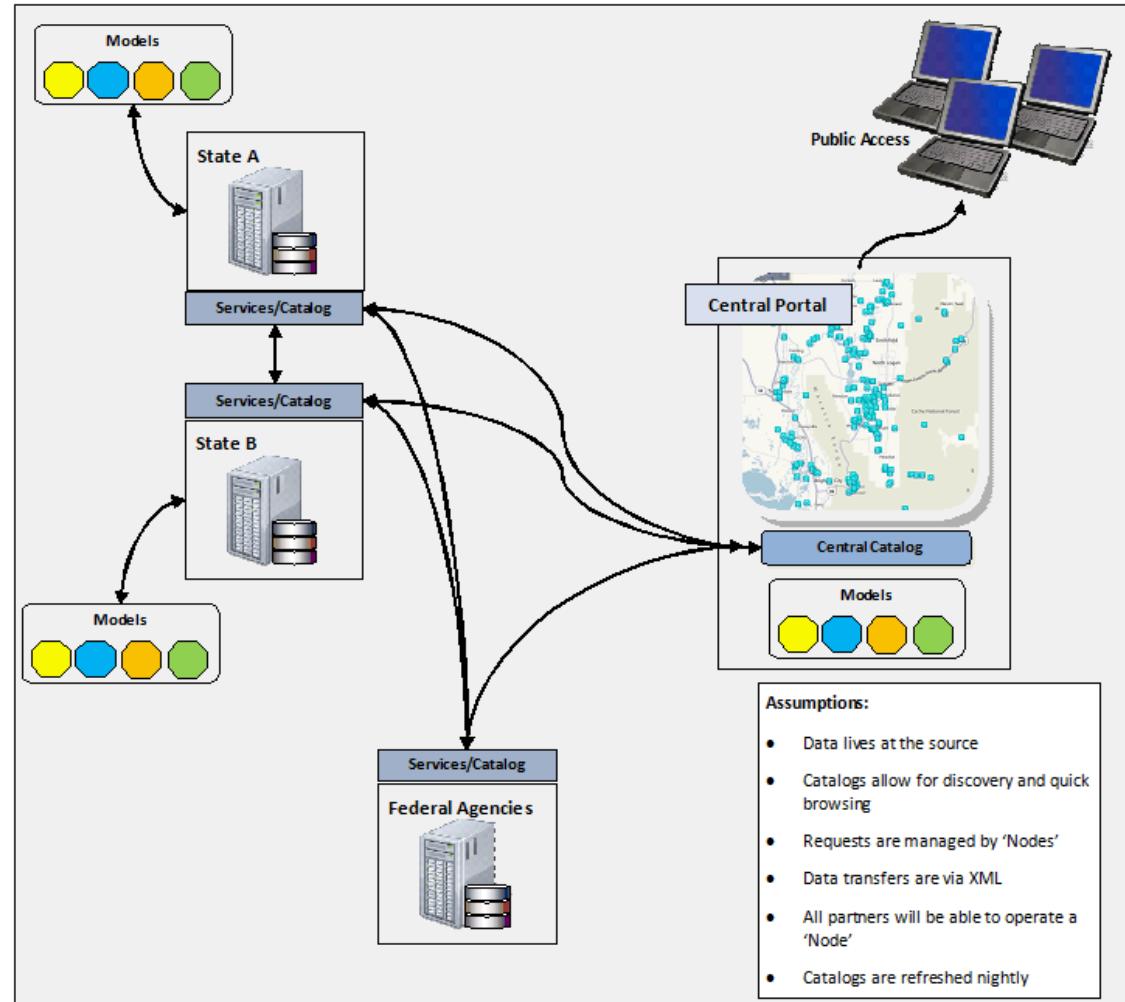

Google Docs

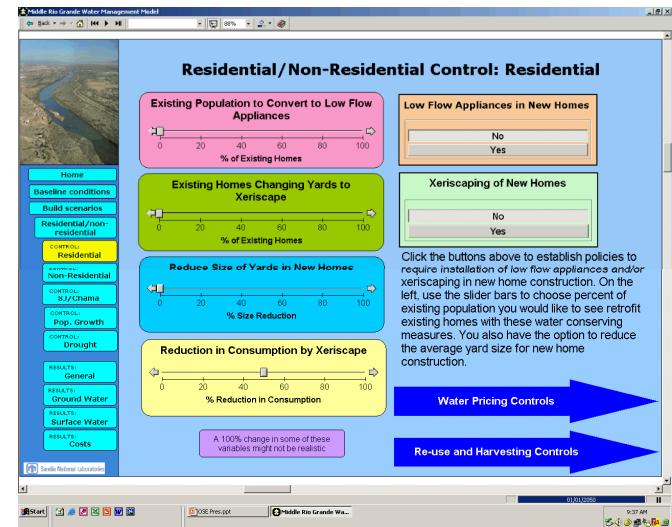

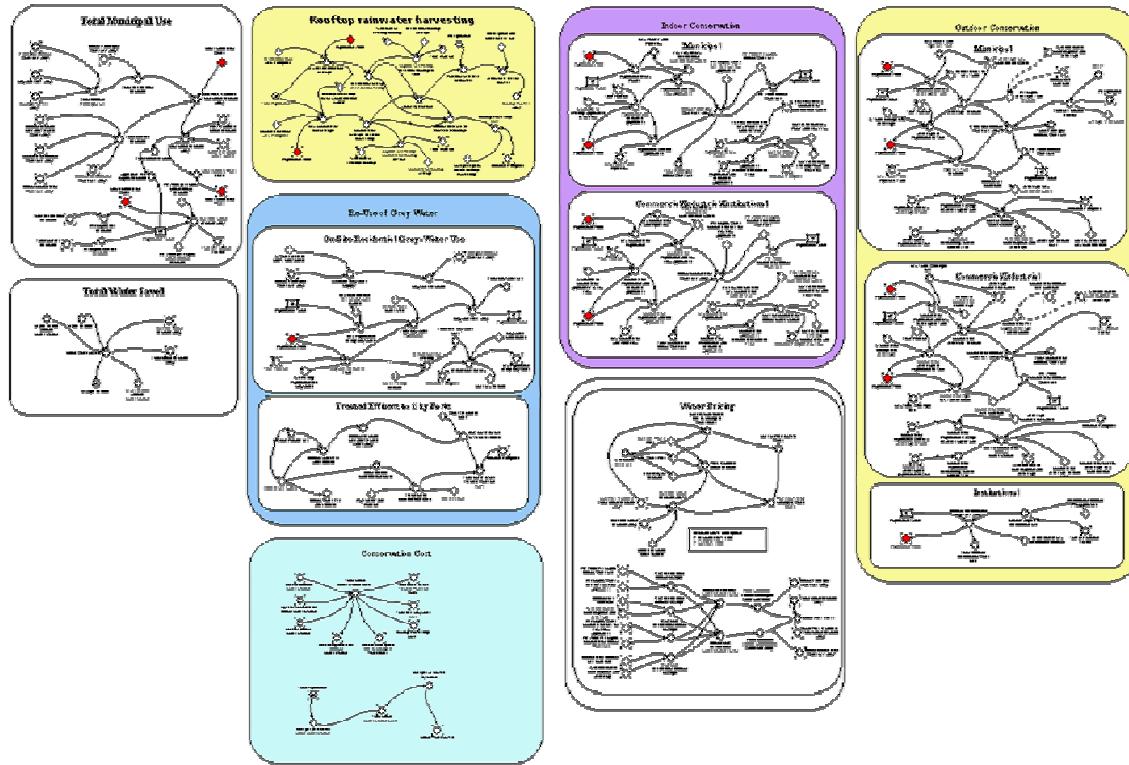

User comments are reported; changes to the metrics are recorded

Water Use Data Exchange (WaDE)

- Use Web Services to transfer data
- Data Stay at the Source (i.e. the states)
- Provide transparent link between state data and integrated water metrics
 - Link to metadata
 - Changes in state data are automatically reflected in metrics
