Briefing Overview

- **Background**
- **Problem Statement**
- **Methodology**
- **Sample Problem**
- **Summary**

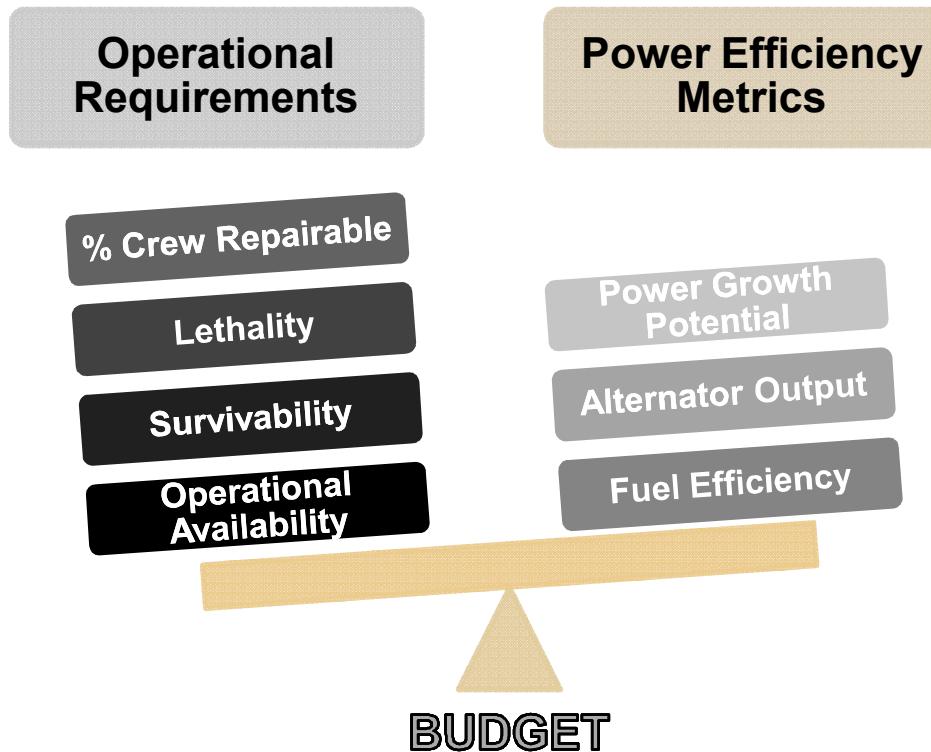

Background

- **Recent government leadership initiatives to improve energy environment, and sustainability management**
- **Acquisition priority**
 - Procuring more energy efficient fleets
- **Understand tradeoffs between often competing objectives**
 - Energy efficient solutions
 - Operational performance
 - Cost

Problem Statement

- **Acquire a more energy efficient fleet that can meet operational requirements at the best possible cost**

Quantitative Analysis of Performance Attributes

Qualitative Assessment based on SME/User criteria

Optimize fleet management and acquisition based on constraints

- Within a single framework, provide a tool that allows for optimum fleet management

Analysis Architecture

Quantitative Analysis

- Alternator Output
- Fuel Efficiency
- Operational Availability
- Survivability

Qualitative Assessment

- Assign relative importance to performance parameters

Optimization

- Budget
- Variants
- Acquisition Rules

Optimization Model Formulation

- **Objective:** Based on weighted performance values (both operational and energy efficient metrics), what is the proper fleet composition of vehicles by variant and how should they be allocated to BCTs and missions?
- **Subject To:**
 - Budget available per period (including price/volume discounts, fixed costs)
 - Number of unique variants of vehicles allowed in the fleet
 - Performance requirements (operational, energy efficient)
 - Theatre, BCT, and Mission requirements
 - Assumptions of existing fleet
- **Key output:**
 - Number of vehicles by variant to purchase (and/or re-purpose) over time
 - Assignment of vehicles by theater, BCT and mission over time

Model Assumptions

- **Initial inventory = 10,000 vehicles**
 - Need 23,436 to outfit 58 Brigades
 - 30 HBCT
 - 8 SBCT
 - 20 IBCT
- **10 performance parameters**
 - Operational Requirements
 - Energy Efficiency Metrics
- **16 vehicle variants available**
 - Acquisition Cost
 - Fixed cost to acquire a new variant
 - Volume price discounts
- **Theaters (Training, Deployment)**
- **Missions (Patrol, MCO, Troop Transport, Convoy)**

Scenarios Examined

- Suppose funds are unlimited and we can support all variants in the fleet – ***“Ideal Fleet”***
- Suppose funds are very tight and we have to minimize the cost but we can support all variants in the fleet – ***“Cheapest Fleet”***
- Tradeoff of performance vs. budget
- Tradeoff of performance vs. number of variants

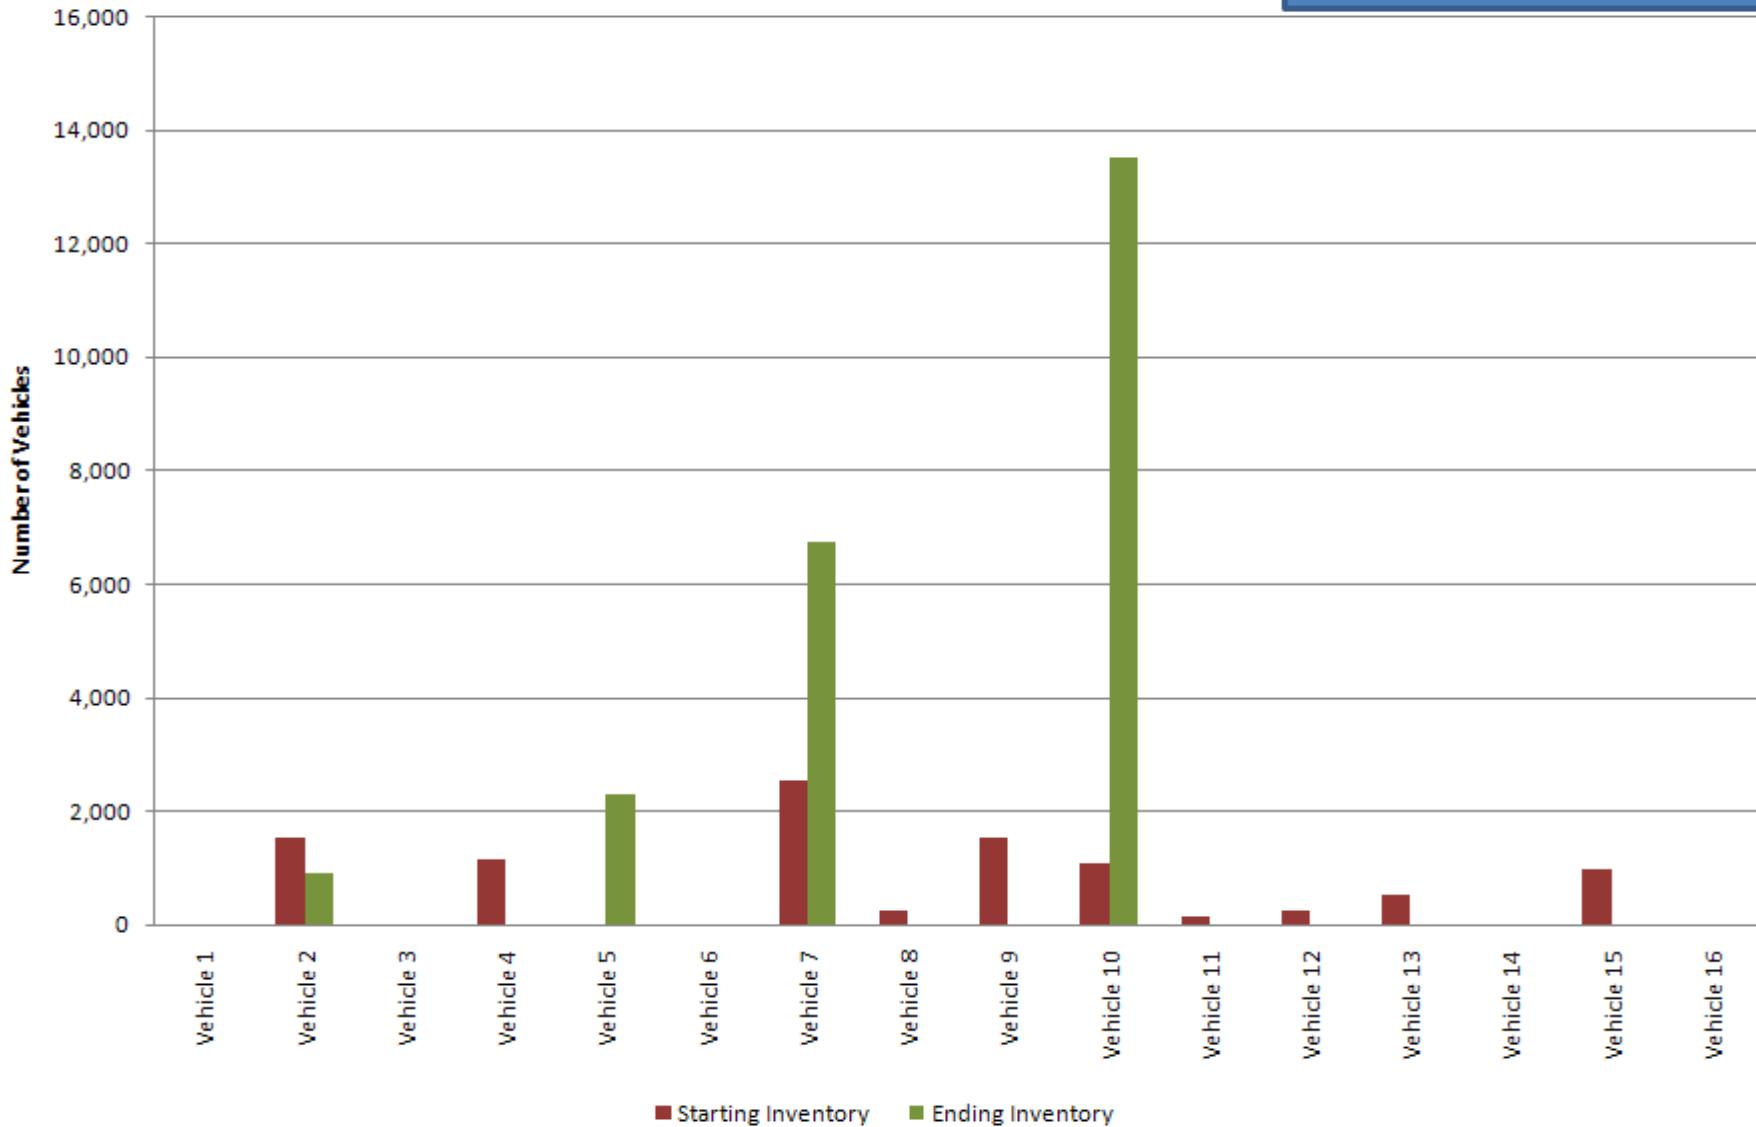

“Ideal Fleet”

Budget: Unlimited

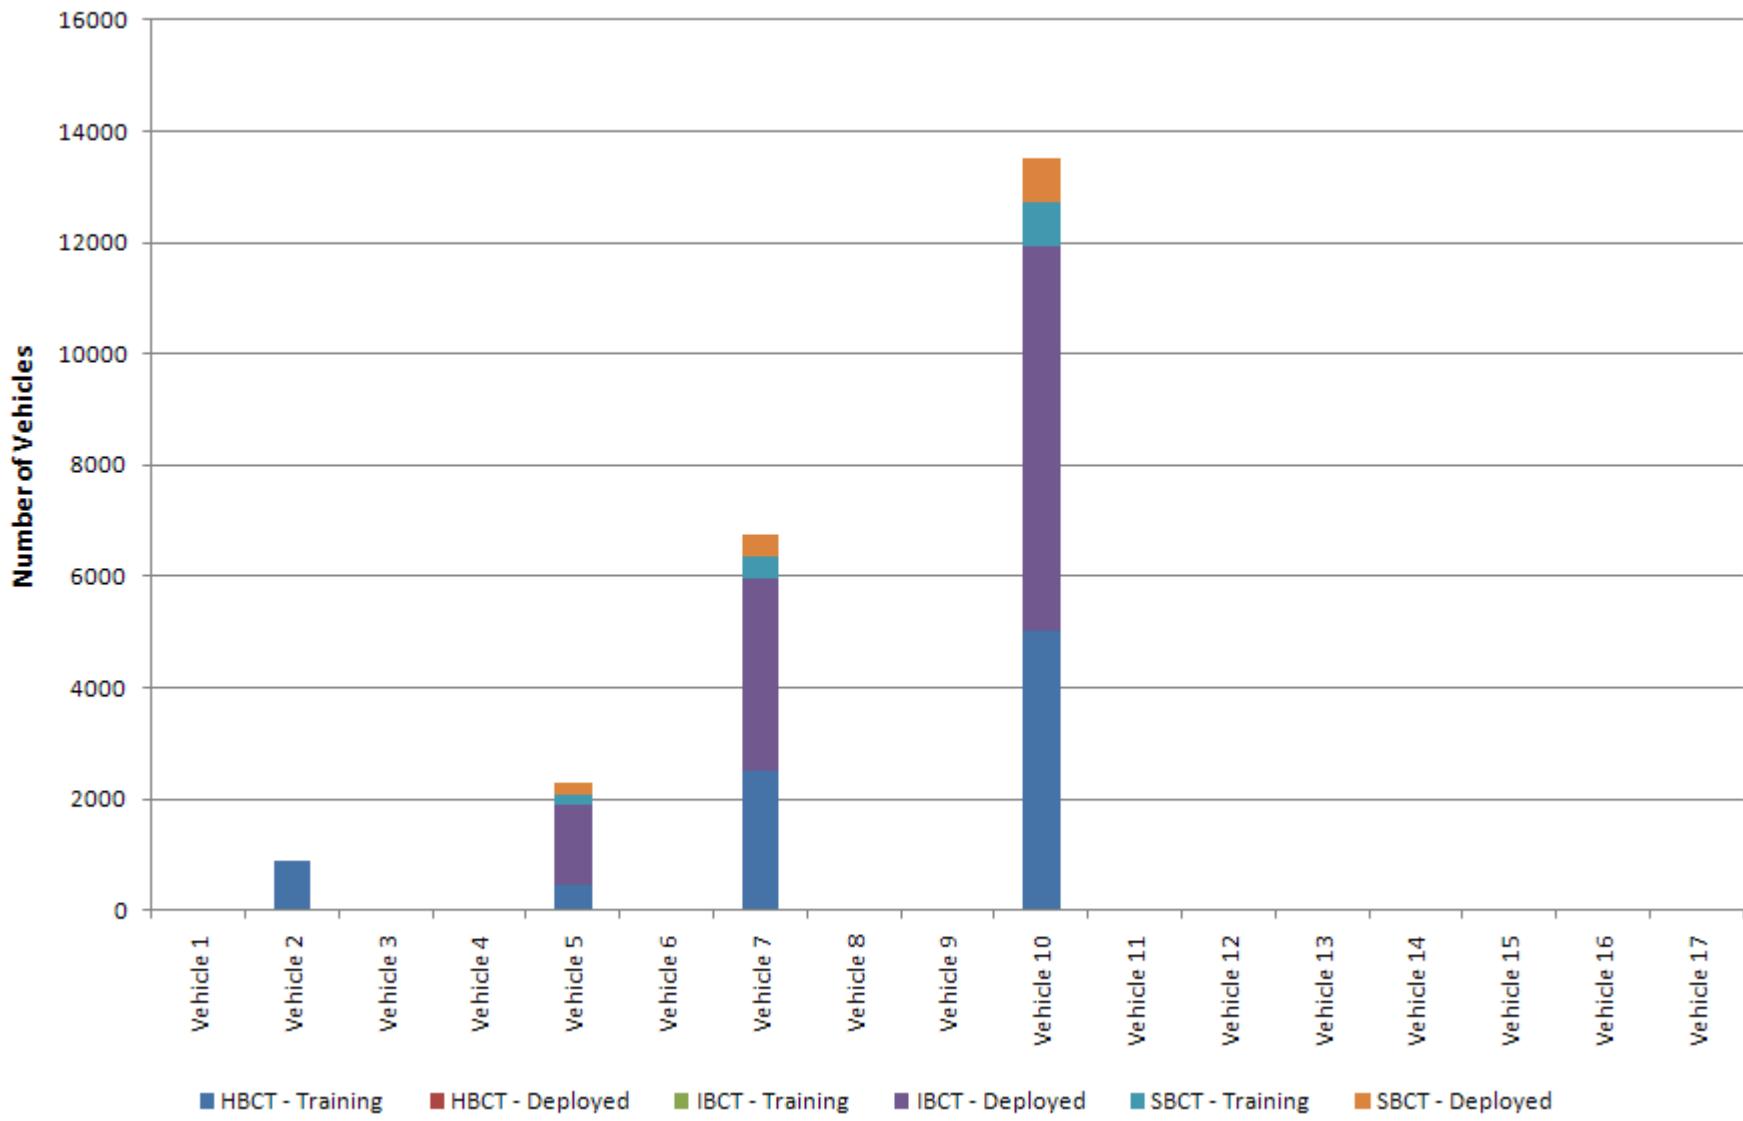

Number of Variants: 16

Ideal Fleet: Initial Vs. Optimal Inventory

5,454 Retired Vehicles
18,892 Purchased Vehicles

Vehicle Assignments to BCT and Theater

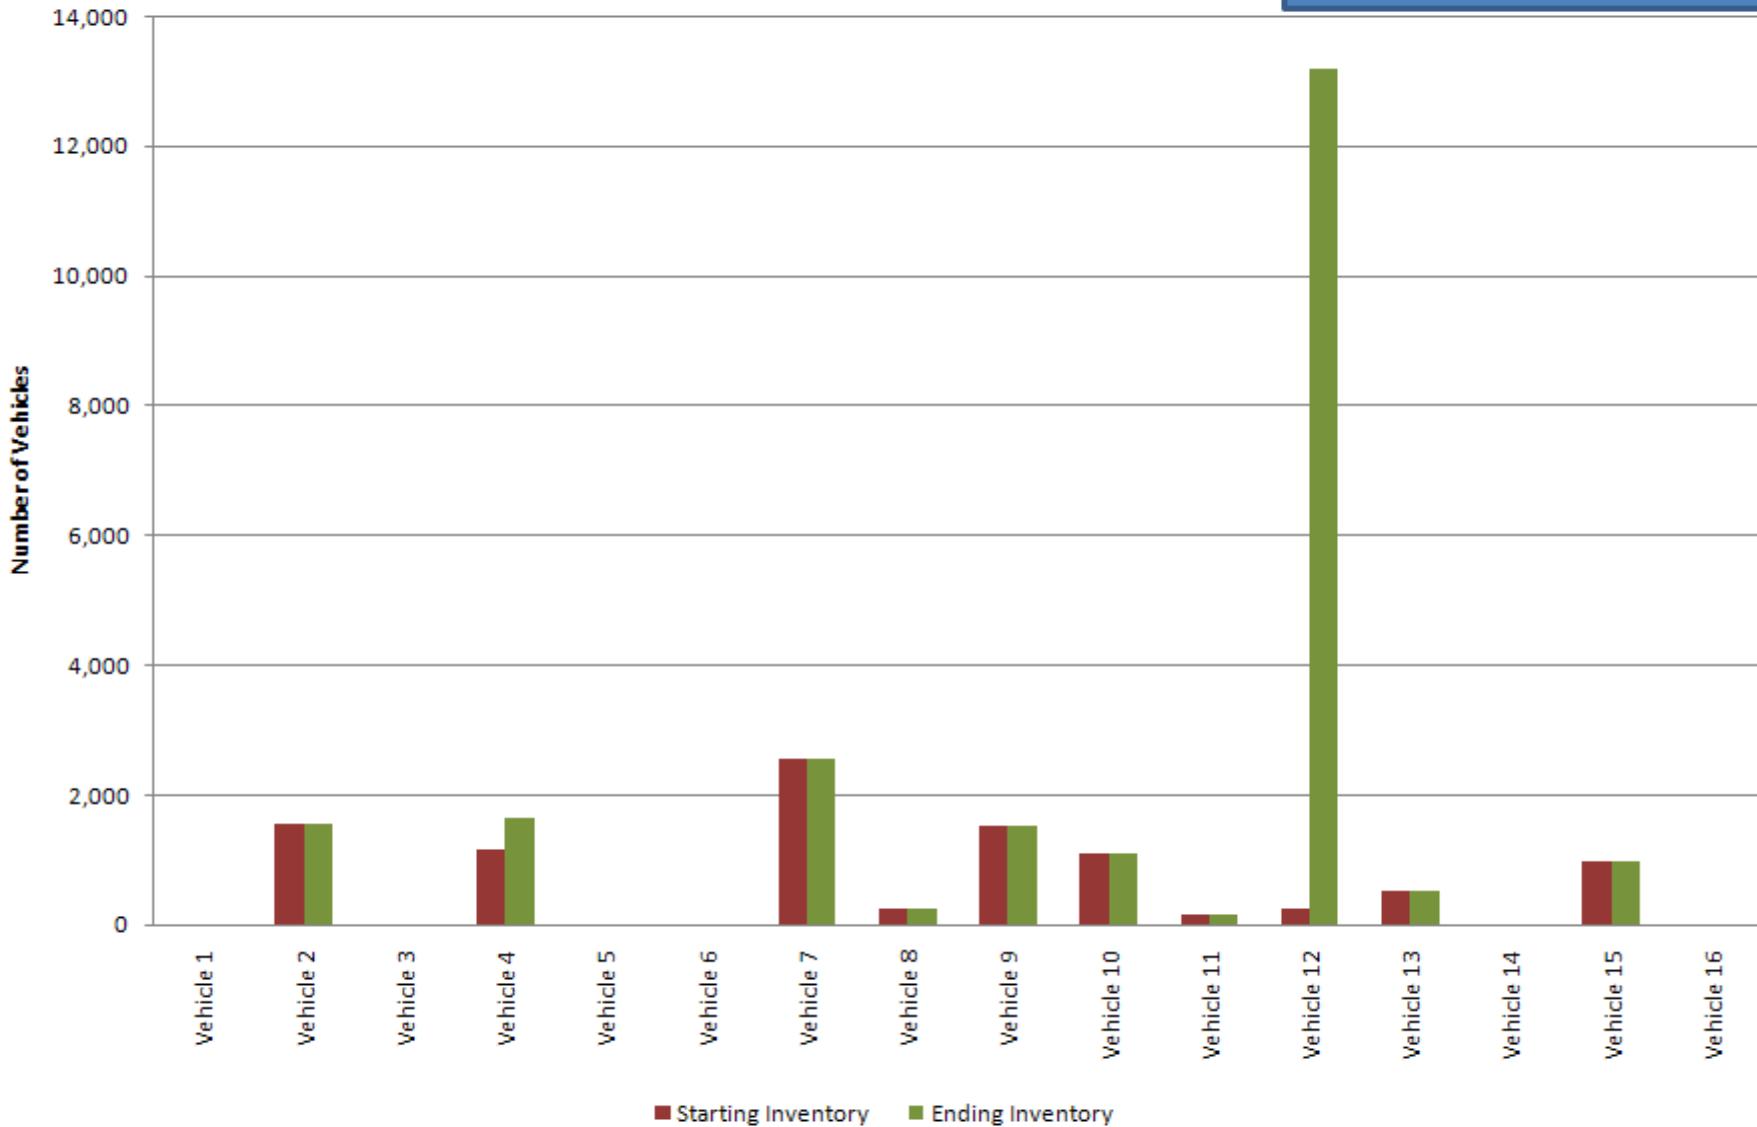

“Cheapest Fleet”

Budget: \$5.18B

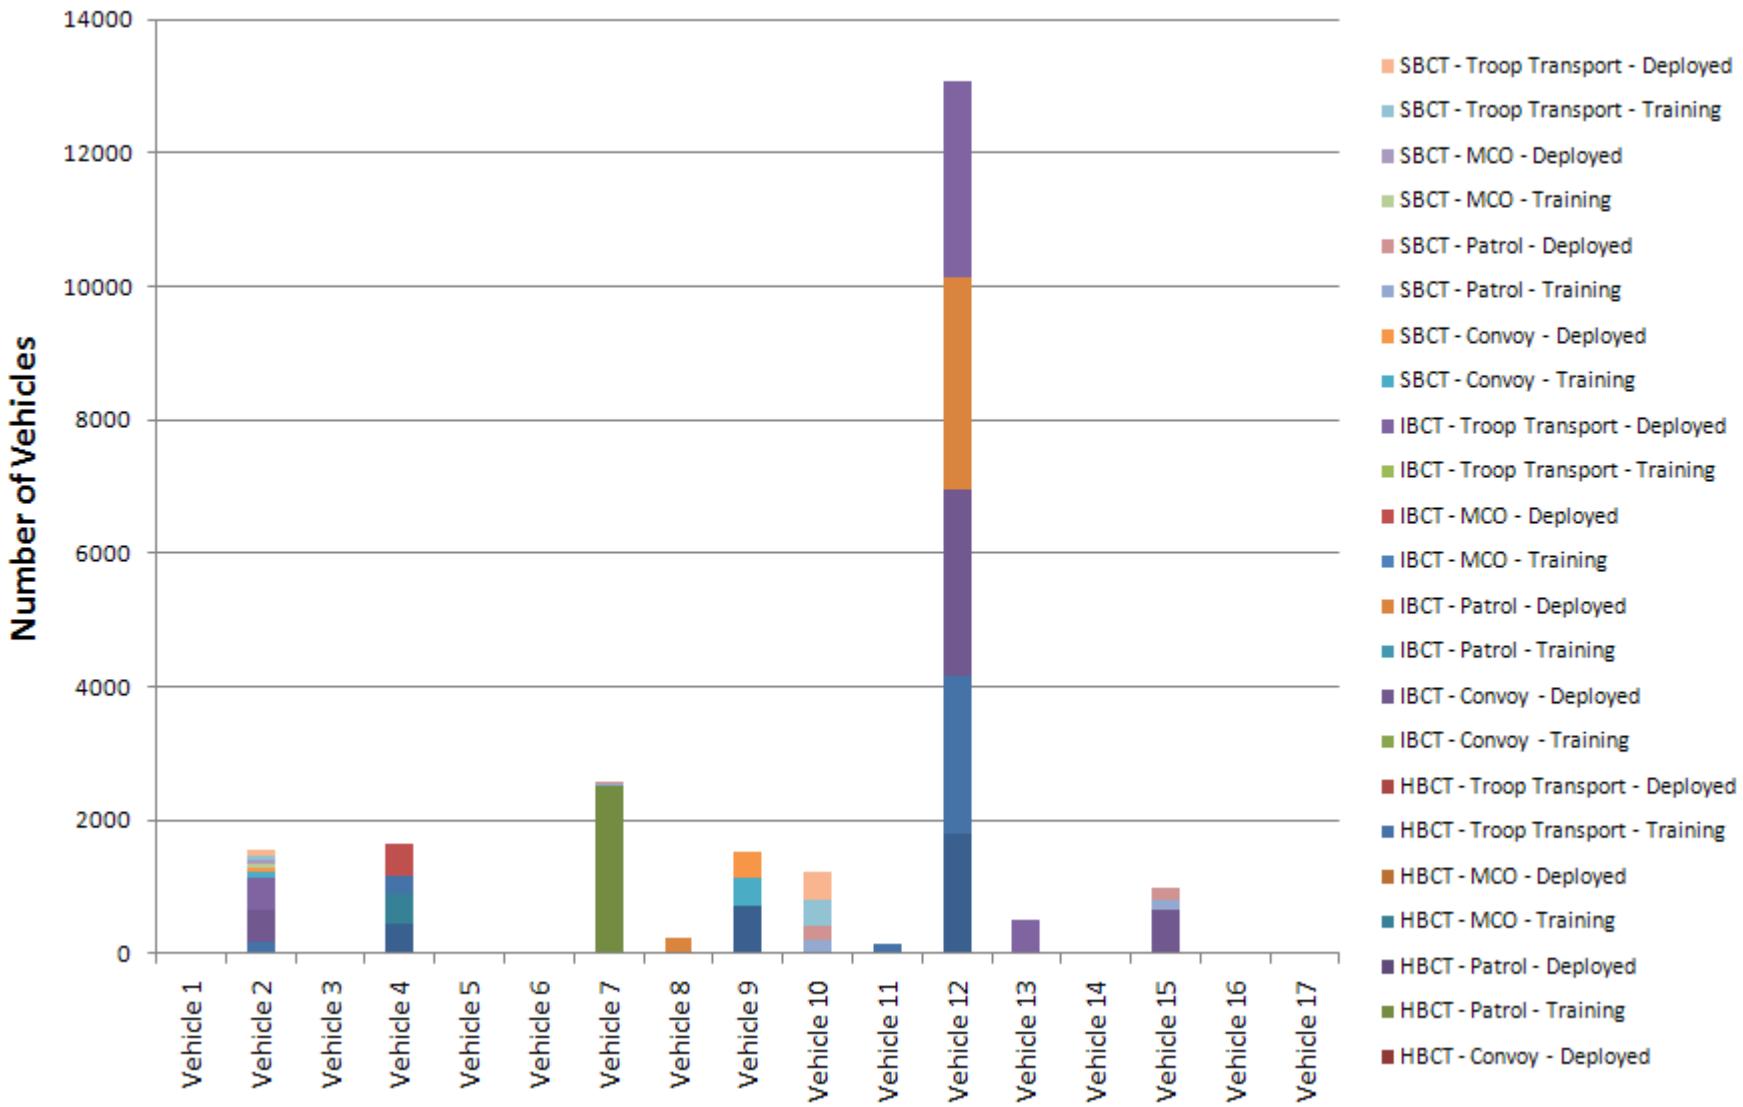

Number of Variants: 16

Cheapest Fleet: Initial Vs. Optimal Inventory

0 Retired Vehicles
13,436 Purchased Vehicles

Vehicle Assignment: BCT, Theater and Mission

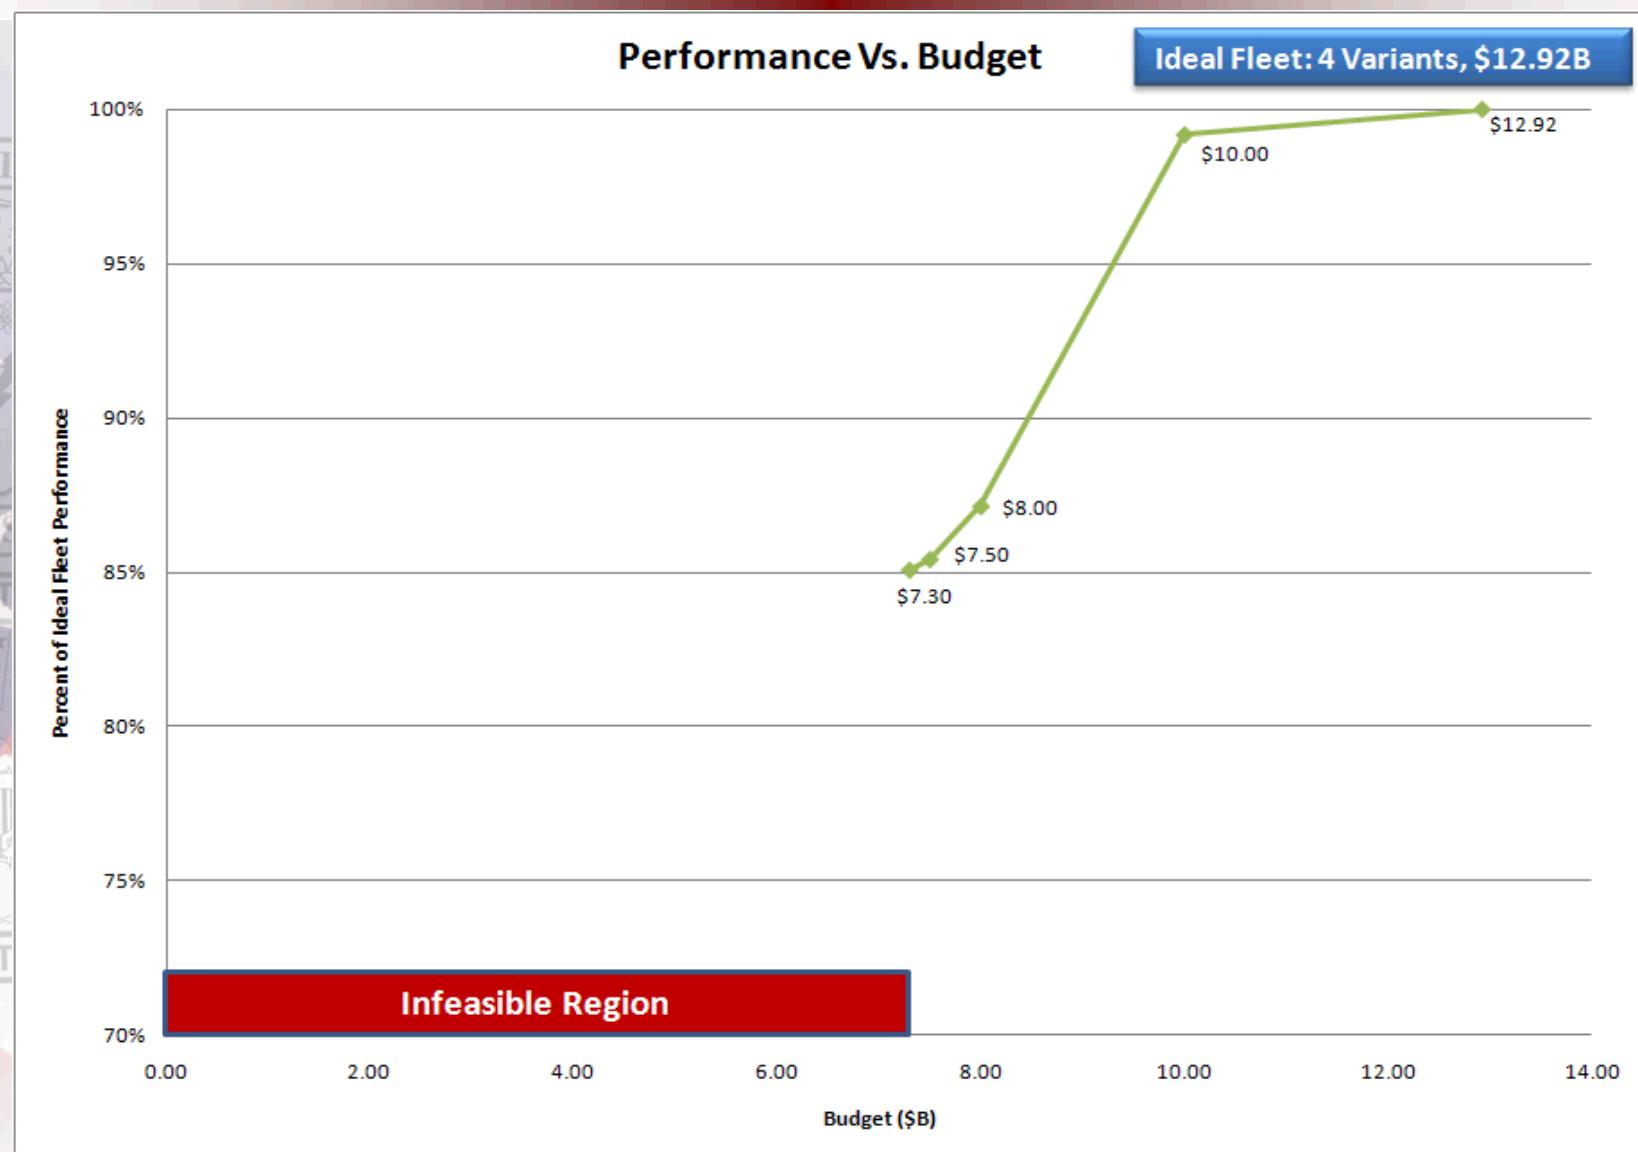

Tradeoff Frontier Performance Vs. Budget

Budget: Variable

Number of Variants: 4

Tradeoff: Performance vs. Budget

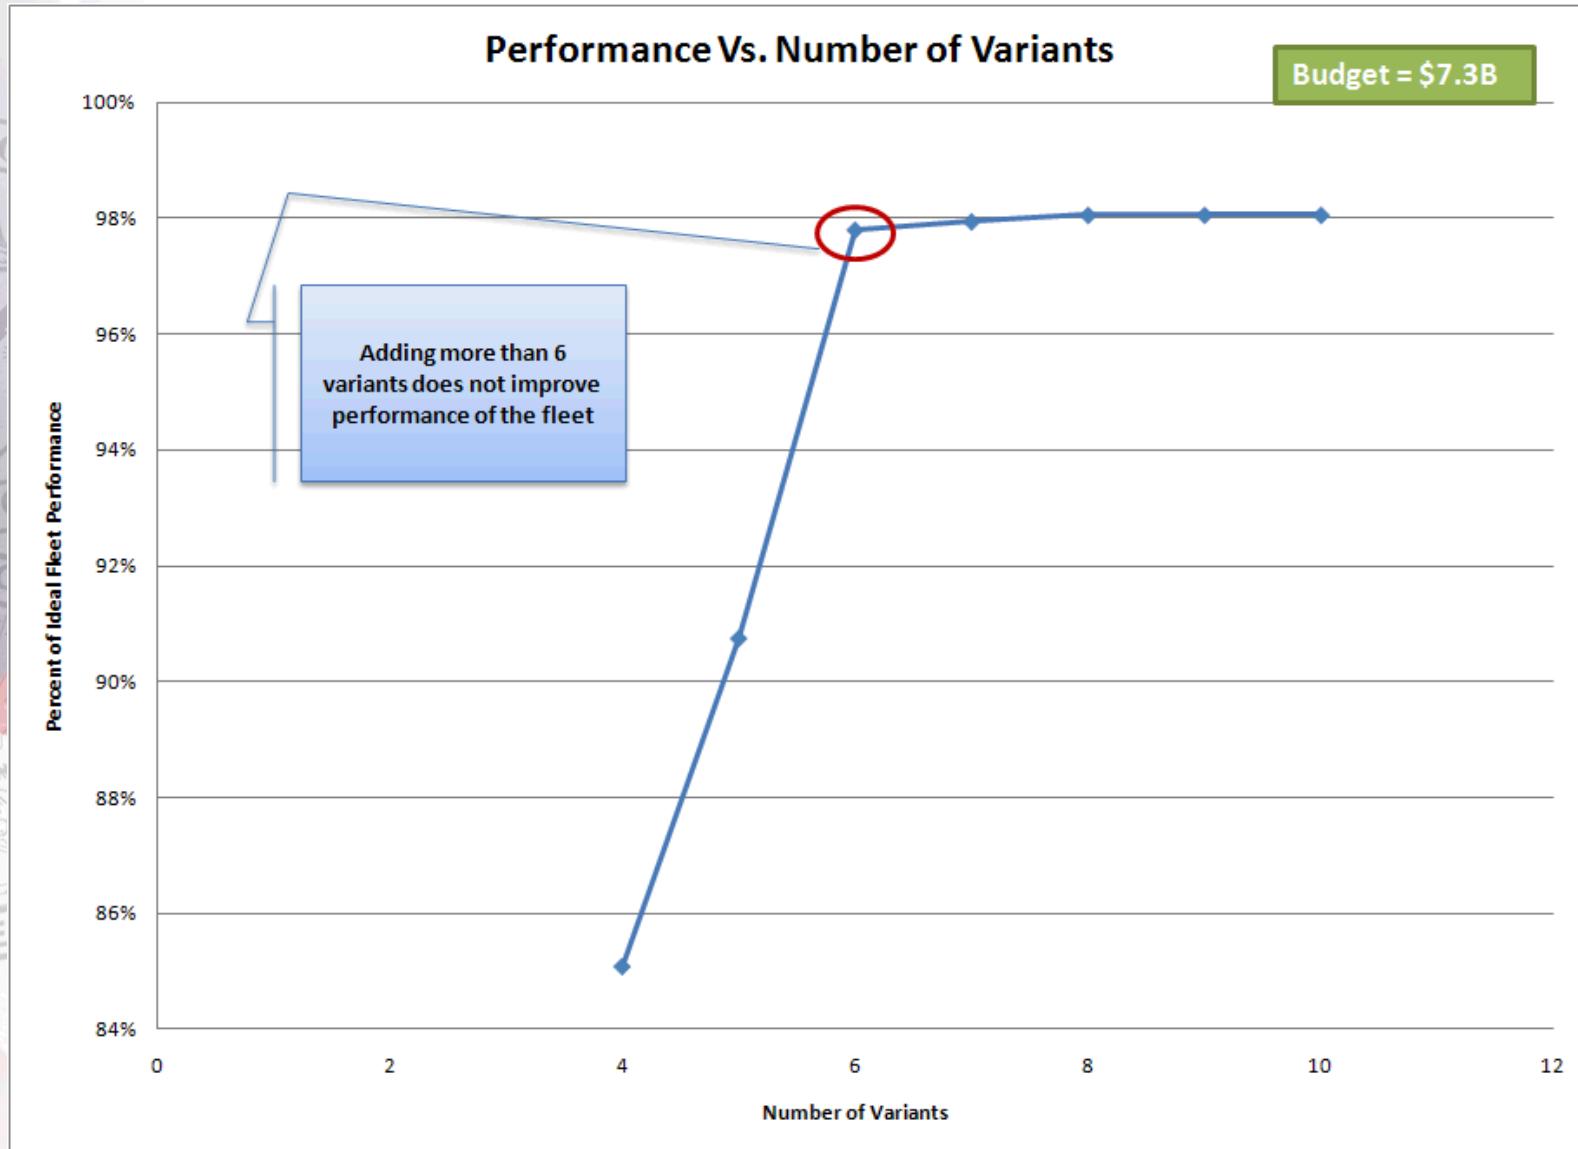

Tradeoff Frontier Performance Vs. Number of Variants

Budget: \$7.3B

Number of Variants: Variable

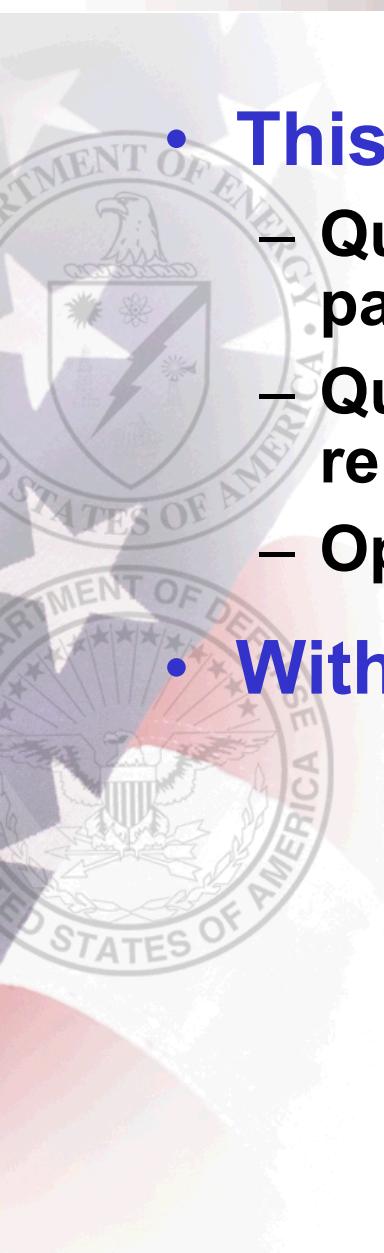

Tradeoff: Performance vs. No of Variants

Summary

- **This analysis framework incorporates**
 - Quantitative analysis of performance parameters
 - Qualitative assessments from SME about relative importance of model parameters
 - Optimization capability to evaluate tradeoffs
- **With increasing scrutiny**
