

Verification Practices for Code Development Teams  
V. Gregory Weirs  
Sandia National Laboratories

This talk will describe practices that code development teams can use to maintain and improve the accuracy of their codes. Textbooks and journal articles provide a necessary theory and framework for assessing codes and their results, but whether code teams succeed or fail to use these techniques is largely driven by their expectations, their approach, and their broader code development environment. While every code team is unique, this talk will describe a pragmatic, flexible approach to sustainable verification.
