SANDIA DER INTEROPERABILITY TEST PROTOCOLS: RELATIONSHIP TO GRID CODES AND STANDARDS

Jay Johnson, Sigifredo Gonzalez, Abraham Ellis
Photovoltaic and Distributed Systems Integration

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

**Silver Jubilee Auditorium
Central Power Research Institute

In Association with

Background

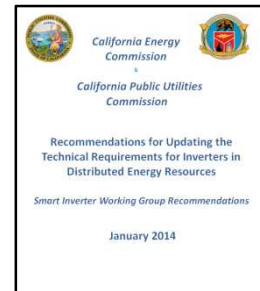

High renewable energy penetrations are leading to grid voltage and frequency stability concerns.

Command	Function
INV1	Connect/Disconnect
INV2	Adjust Max Generation Level
INV3	Adjust Power Factor
INV4	Request Active Power
INV5	PV/Solarage Functions
VV11	Volt-Var mode
VV12	Volt-Var mode
VV13	Volt-Var mode
VV14	Volt-Var mode
FW21	Set maximum power output
FW22	Set maximum power output
TV31	Dynamic reactive power support
L/HVRT	Connect/disconnect settings
WP41	Power factor settings
WP42	Power factor settings
VW51	Set output to smooth voltage
VW52	Set output to smooth voltage
TMP	Temperature mode behavior
PS	Signal mode behavior
DS91	Modify DER Inverter Settings
DS92	Event/Status Logging
DS93	Status Reporting
DS94	Time Synchronization

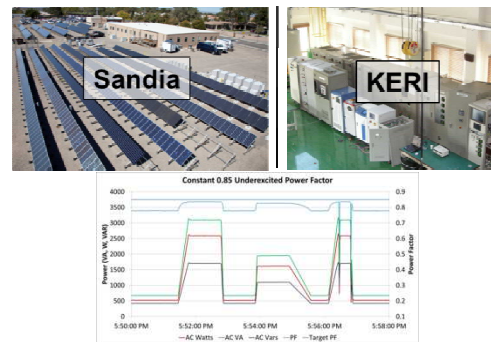

Based on EPRI and Sandia research, advanced interoperability DER functions are standardized in IEC 61850-90-7.

National grid codes are updated to require inverters to have advanced grid functions.

In Nov 2013, Sandia releases the Advance Interoperability Test Protocols matching the IEC functions.

Sandia and other SIRFN laboratories begin exercising the test protocols to refine the procedures, parameter selection, and number of tests.

Based on recommendations from Sandia and other industry experts, IEC and UL create certification standards for advanced DER.

Introduction

- Test Protocols for Advanced Inverter Interoperability Functions Report
 - Creates procedures for testing the interoperability (communications) and electrical behavior of DER devices for different advanced inverter functions
 - Protocols are intended for use by:
 - manufacturers to accelerate development of the advanced functions
 - certification bodies (IEC, UL, etc.) for use as the basis for certification testing procedures.
- The Smart Grid International Research Facility Network (SIRFN) is exercising the test protocols to improve them prior to adoption by certification bodies.
- We identify gaps in the U.S., Spain, Austria, Italy, and the United Kingdom for national grid codes, and definitions and certification procedures for interoperability and advanced functionality.

Types of Advanced Inverter Functions

Voltage Support

- Adjust Power Factor (INV3)

- Volt-Var Mode (VV11, VV12, VV13)

- Dynamic Reactive Power (TV31)

- Volt-Watt Mode (VW51; VW52)

Frequency Support

- Adjust Maximum Active Power (INV2)

- Request Active Power from Storage (INV4)

- Signal for Charge/Discharge (INV5)

- Frequency-Watt Mode (FW21, FW22)

- Watt-Power Factor (WP41, WP42)

Grid Protection (Response to Disturbances)

- Connect/Disconnect (INV1)

- Low and High Voltage Ride Through (L/HVRT)

- Low and High Frequency Ride Through (L/HFRT)*

- Temperature Mode Behavior (TMP)

*FRT not included in IEC 61850-90-7, but is included in Rule 21 SIWG recommendations and Sandia Test Protocols.

Sandia Test Protocols

- General guidelines for harmonized equipment testing across different laboratories
- Precursor to future equipment certification procedures.
- Two distinct phases for most advanced functions
 - **Communication**
 - Send the signal from the Utility Management System Simulator
 - Verify the communications reached the EUT
 - **Electrical behavior characterization**
 - Measurement of the DC and AC characteristics to verify the inverter updated its operation
- Communication phase of the test protocol sequence may be skipped for some inverters if there is no translator.

Example Test Protocol Sequence (Volt/Var VV11)

	Step	Task	Function	Notes
Communication	1	Utility requests status from EUT.	DS93 – Status Reporting	Log time sent.
	2	Utility receives response to the command.		Log time received.
	3	Utility issues a Volt/Var command.		Log time sent. Command may include the following parameters: • Requested ramp rate • Time window (optional) • Requested (optional)
	4	Utility receives response to the command.	–	Expected response message: • Successful • Rejected (includes reason)
Electrical Behavior	5	If Success response received, verify command was successfully executed by		Monitor and record electrical output of EUT: • Voltage • Amplitude
	6	Repeat test with varying behavior of the reasonably understood Test the time out period by rerunning the test profile in Figure A6.3		enabled.)
Analysis		Characterize EUT response		Determine if command was

Codes and Standards

Ask experts in U.S., Spain, Austria, Italy, and the United Kingdom to provide references for any of the following codes and standards for each of the advanced functions:

1. *Grid code* - requires grid-interconnected DER to have certain advanced functionality.
2. *Advanced function definitions standard (Adv. Fcn Std.)* - defines the advanced function (parameters and operation).
3. *Advanced function certification standard (Adv. Fcn Cert. Std.)* - defines a test procedure/protocol to verify equipment functionality and certifies the DER for field deployment.
4. *Interoperability definition standard (IOP Std.)* - defines the utility-to-DER or energy management system-to-DER communications.
5. *Interoperability certification standard (IOP Cert. Std.)* - defines a test procedure/protocol to verify the communications to/from DER.

Codes and Standards for the US and Spain

 = gaps in standards which the Sandia Test Protocols could fill.

Conclusions

- Advanced inverter functions can help stabilize grid voltage and frequency.
- Some jurisdictions beginning to require certain 61850-90-7 functions for interconnected PV inverters and other DER.
- Based on this study there is a clear gap in certifications standards for these functions.
- Sandia Test Protocols have the potential to become the basis for the certification tests for the functions defined in IEC TR 61850-90-7.
- If the Sandia Test Protocols are used for all national and international certification test requirements, the testing procedures will be harmonized and manufacturers will not need to preform multiple versions of the certification test.
