Federal Aviation Administration

Presentation Outline

- Motivation & Outcomes – Support Widespread Fatigue Damage (WFD) Rulemaking
- Review of 1990s Airworthiness Assurance Working Group (AAWG) Repair Survey (tasked by the Aviation Rulemaking Advisory Committee (ARAC))
- Airplane Models and Number of Repairs, Alterations and Modifications (RAMs)
- Data Mining - Service Difficulty Reporting Database
- Field Survey Activities – Process, Schedule, and Status
- Teardown Activities - Process, Schedule, and Status
- Field Survey & Teardown Database - Process, Schedule, and Status
- Questions

Project Motivation

- Goal: provide data to better understand the risks that Repairs, Alterations and Modifications (RAMs) may pose for developing widespread fatigue damage (WFD).
- Widespread Fatigue Damage (WFD)
 - Simultaneous cracks
 - Multiple (repeating) structural locations
 - Multiple Site Damage (MSD)
 - Multiple Element Damage (MED)
 - Sufficient size and density so structure can no longer carry load
- WFD Rule - Notice of Proposed Rulemaking issued April 2006
 - Requirement for design approval holders to evaluate baseline airplane structure and certain repairs, alterations, and modifications for WFD
 - Public comments suggest RAMs should be removed
 - No recorded accidents attributed to WFD in properly installed RAMs
 - Adverse service experience limited to baseline airplane structure
 - Aging Airplane Safety Rule & Damage Tolerance Data for Repairs and Alterations Rule requires surveys and damage tolerance evaluations be performed on RAMs

Project Motivation

- General agreement among industry stakeholders - low risk of WFD occurring in RAMs
- FAA determined WFD assessments should focus on baseline structure only
 - Establishing a limit of validity (LOV) of the engineering data
 - LOV supports the structural maintenance program for airplane models
- This and other changes are described in a technical document that was published in the Federal Register on November 7, 2008
- The FAA is further assessing whether additional regulatory actions are needed to address RAMs that may pose a risk of developing WFD
- This Survey of RAMs is providing data to support FAA WFD rule making

Expected Outcomes of the Current RAMs Survey

1. Determine the (average) number of RAMs per airplane
2. Determine the size(s) of repairs.
3. Determine the average age of each RAM (relative to design service goal).
4. Determine the location of each RAM (relative to fatigue sensitivity).
5. Determine the source of RAM data (Structural Repair Manual, Designated Engineering Representative or Manufacturer Engineering).
6. Determine the reason for each RAM (i.e. the causal factor).
7. Determine if any subsequent damage occurred (especially fatigue cracking).

Project Tasking

Task 1. Work Plan and Review Prior AAWG Survey

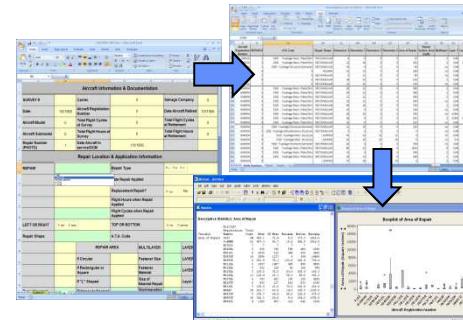

Task 2. Survey Aviation Safety Data

Task 3. Field Survey of Repairs, Alterations & Modifications

Task 4. Teardown Inspections of Retired Repairs, Alterations & Modifications

Task 5.
Documentation
and Database
Development

FAA William J. Hughes

Review of Past AAWG Repair Survey

- The AAWG conducted a focused survey of repairs placed on airplanes
 - 1992 Fuselage Repair Survey of Stored Airplanes
 - 1994 Repair Survey of In-service Airplanes
 - Final Report published on 12/12/1996
 - Surveys performed by OEM, Operator & FAA personnel
- Quick external only survey that placed each repair into Category A, B or C
 - Category A: A permanent repair for which the baseline zonal inspections are adequate to ensure continued airworthiness (inspectability) equivalent to unrepainted surrounding original structure.
 - Category B: A permanent repair that requires supplemental inspections to ensure continued airworthiness.
 - Category C: A temporary repair that will need to be reworked or replaced prior to an established time limit. Supplemental inspections may be necessary to ensure continued airworthiness prior to this limit.

AAWG Fuselage Repair Survey Statistics

TASK 1

AAWG Repair Survey Summary & Conclusions

- Survey was based on AAWG Repair Criteria with OEM size & proximity limits
- Teams inspected 65 airplanes
- Teams inspected 1051 repairs (40% Category A & 60% Category B/C)
- Repairs general of good quality and done per the SRM
- Category B/C repairs mostly due to size/proximity criteria
- Confirmed need for Repair Assessment Evaluations (current RAP programs)
- No immediate repair safety concerns observed
- Operators needed repair assessment procedures from OEMs
- Older airplanes generally have more repairs
- Repair assessment training needed for operators & FAA PMIs
- Majority of repairs on the fuselage pressure shell

Objectives of AAWG Repair Survey

SCOPE OF REPAIR SURVEYS

- External visual observation of external lower fuselage plating repairs.
- Inspections designed to be conducted quickly, with no more than a work stand and light.
- Repairs which clearly do not meet existing Structural Repair Manual guidance will be reported to the operator.

PURPOSE OF REPAIR SURVEYS

- Gain first-hand observations of typical repairs.
- Sample of numbers, types, proximity, condition of repairs, etc.
- Identify SRM quality repairs that may require additional attention to ensure continued airworthiness.
- Observe any repairs which are below SRM standards.
- Develop a qualitative opinion of the team's concern for repairs as a safety issue, if any.

DISPOSITION OF SURVEY FINDINGS

- Document the observations in a standard way that can be combined for all OEMs.
- Make recommendations for further effort as appropriate.

Objectives of Current RAMs Survey

- Determine if there is a risk of WFD occurrence associated with RAMs
- Determine the average number of RAMs per airplane
- Determine the size(s) of repairs.
- Determine the average age of each RAM relative to design service goal.
- Determine the location of each RAM (relative to fatigue sensitivity).
- Determine the source of RAM data (SRM, DER, ECO?).
- Determine the reason for each RAM (i.e. the causal factor).
- Determine if any subsequent damage occurred (especially fatigue cracking).

<td

Scope of Current RAMs Survey

- Includes repairs, alterations and modifications on entire airplane
- Aircraft of interest were initially pre-amendment 25-96 design type
 - Recent changes have added all transport airplanes operated in US domestic fleet (~4600 airplanes) to the sample pool
- Airplane models of interest are similar to those in the 1996 AAWG repair survey, but somewhat expanded
 - Boeing 727, 737, 747, 757 & 767
 - McDonald Douglas DC-9 & MD 80/90 & DC-10/MD11
 - Airbus A300, A310, A318-319-320 series
- Number of RAMs should equal or exceed that from the 1996 AAWG Final Report on Continued Airworthiness of Structural Repairs
 - Greater than 65 airplanes and 1051 Repairs
 - Recent changes have increased number of airplanes & RAMs
 - 134 Airplanes
 - Approximately 2065 RAMs
- Focus on In-Service airplanes instead of retired airplanes
 - Records availability and access to RAM interior for visual inspection

Completed Field Inspections of RAMs at Operator Maintenance Locations

Gaining operator approval and coordinating these surveys requires a huge time commitment. Several levels of communication are typically required.

Location	Date	Airplanes
MX Base 1	12/2/08	DC-10, MD 10
MX Base 2	1/9/09	737/757/MD80
MX Base 3	1/14/09	757
MX Base 4	1/20/09	727
MX Base 5	2/10/09	737
MX Base 2	2/23/09	737/757/MD80
MX Base 6	3/16/09	757/767/A300/A310
MX Bases 8 & 9	4/20/09	DC-9, A320, 757, 767
MX Base 2	4/27/09	737

Planned Field Inspections of RAMs at Operator Maintenance Locations

Location	Date	Airplanes
MX Base 3	5/4/09	757
MX Base 5	5/11/09	737
MX Base 10	5/18/09	A320 series
MX Base 2	5/25/09	737NG
To Be Determined	June-Dec 09	

Plans are subject to change on short notice due to airplane scheduling needs of operators.

FAA William J. Hughes
Technical Center

TASK 3

In-Service Airplanes RAMs Survey

Target Airplanes

Aircraft Type	Sample Plan Sandia / Goal as of end of March 2009													Total Aircraft
	OP1	OP2	OP3	OP4	OP5	OP6	OP7	OP8	OP9	OP10	OP11	OP12	OP13	
A300&310			1			3						2		6
A320Series			1					3	4		4		5	17
A330									1				1	2
B727						4								4
B737-Classic		1		1						10	1		2	15
B737-NG	1	2	2	4	2					6	1			18
B747									3		1	1		5
B757			3	1	3				1		2	2	1	13

Technical Center

TASK 3

Teardown Inspections of Repairs from Salvage Yards - Specimens

- Examples of general structures of interest :
 - Passenger to freighter cargo door conversion surround frame.
 - Wing spar repair/modifications.
 - Fuselage lap joint replacement modifications.
 - Large area repairs on fuselage, wing and empennage structures.
 - Small repair clusters on fuselage, wing and empennage structures.

FAA William J. Hughes
Technical Center

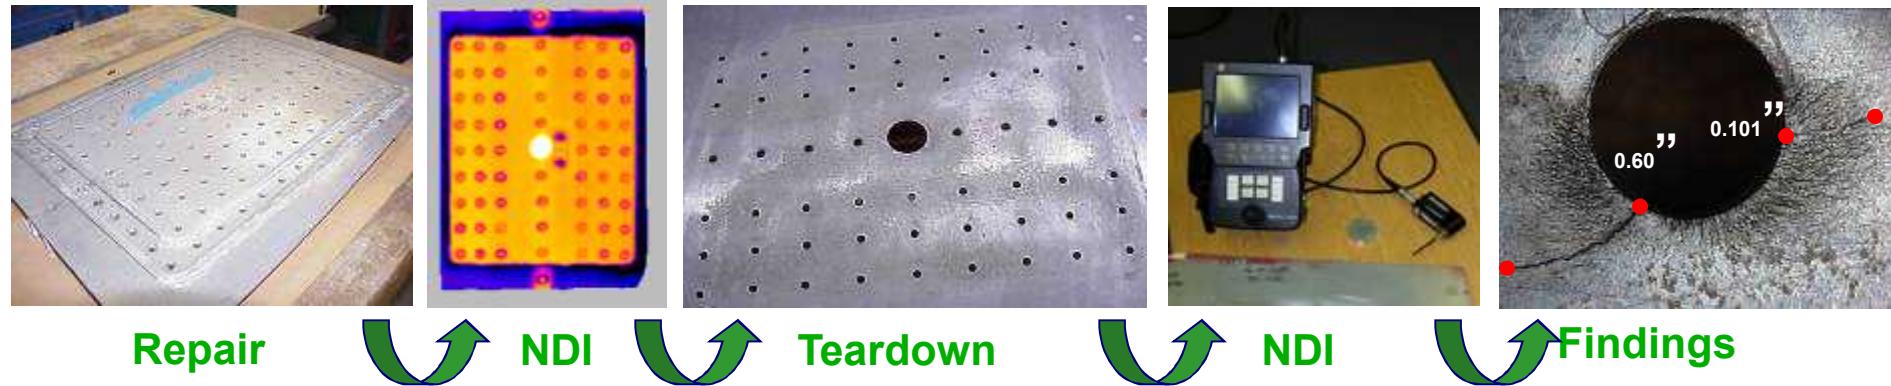

TASK 4

Teardown Inspections of Repairs from Salvage Yards - Protocol

1. RAMs cut from aircraft
2. RAM location on aircraft documented
3. RAM reason, engineering basis, flight hours and cycles determined
4. Nondestructive Inspective (NDI) deployed from outside of the airplane as appropriate
5. Partial Teardown and Eddy Current Bolt Hole Inspection
6. Complete Teardown to separate repair and skin layers, and remove sealant
7. In-depth NDI deployed to characterize the repair as appropriate
8. Direct visual inspections with stereo microscope

Teardown Inspections of Repairs from Salvage Yards - Status

B737-200 fuselage sections – Lap Joint Modification

- Fastener removal of first large window belt lap splice alteration completed
- Bolt Hole Eddy Current NDI of fastener holes about half done. Other Eddy Current to follow
- Detailed Visual inspection of surrounding structure done
- Removal of layers and final NDI remains to be done
- Modified structure has 25452 cycles since installation and 76633 total cycles at retirement

RAMs Field Survey and Teardown Database Deliverable

- Microsoft Excel with links to photo documentation & maintenance records
- Using digital technology to increase the speed and accuracy of field data acquisition
 - Tablet computer
 - Real-time image import and annotation of digital images
 - Direct download of annotated images
 - Easy importation of operator supplied repair assessment technical data (when available)
 - Automatic generation of status reports and running totals
 - Capturing information in up to 72 categories for each RAM

Automation of Data Entry, Manipulation, and Analysis

Rams with Documentation
183

FAA William J. Hughes
Technical Center

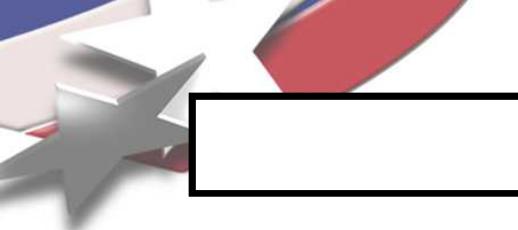

Schedule

- **AANC will complete field surveys on schedule by December 09**
 - 134 Airplanes
 - Thousands of individual RAMs anticipated
- **Teardown activities have been deferred until 2010**
 - Number of specimens to be defined
 - Types of specimens are well defined

Summary

- **Conducting survey and teardown of Repairs, Alterations and Modifications on Transport Airplanes in US Domestic Fleet**
- **Gathering data on incidence of fatigue cracking associated with RAMs**
- **Data to determine if additional rulemaking is necessary to address RAMs for WFD in transport airplanes**
- **QUESTIONS???**
