

## Combining Rutherford Forward Scattering with Elastic Recoil Detection in a Single Detector<sup>\*</sup>

Barney L Doyle, James E. Stevens, Matthew Marinella, Daniel R. Kammler, Andrew J. Lohn Sandia  
*National Laboratories, Albuquerque, NM*

Research in the Ion Beam Lab at Sandia has encountered two projects where it has become advantageous to perform both Rutherford Forward Scattering (RFS) and ERD together using just one detector mounted in the forward direction (RFSERD). The first project involved determining the stoichiometry of nanometer-thick Ta<sub>2</sub>O<sub>x</sub> films to perfect deposition of memristive materials for high-density memories. RFSERD's advantage is that the accuracy of determining the stoichiometry of these films depends only on the statistics of the yield measurement, since the cross-sections are well known, just Coulomb scattering and recoiling. The optimum beam for RFSERD in this case was found to be 42 MeV Si, target-tilt=75°, detector angle=30° and a 13.5 micron Mylar foil to range out Si scattered from the Si substrate. The RFS and ERD cross sections are both large providing a statistical accuracy of ~1%, a requirement to calibrate the Ta<sub>2</sub>O<sub>x</sub> deposition system. The second project microscopically mapped the H concentration in glassy aluminas, where H is known to affect the intergranular glassy phase. The new Pelletron-microbeam in the IBL was used to focus 0.75 MeV He onto these ceramics that had been thinned to 1 micron. RFSERD was then performed in transmission without a range foil, where the ERD provided the H areal density and the energy shift of the RFS signal gave an accurate measurement of the sample thickness, thereby providing the spatially-resolved H concentration in the sample. RFSERD using one forward detector is a new IBA technique that is therefore finding great utility in our lab, and could be broadly applied across the IBA community.

<sup>\*</sup> Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.
