

SAND2007-3574C

# Verification of the *Calore* Thermal Analysis Code

**K. J. Dowding and B. F. Blackwell**  
**Sandia National Laboratories**  
**Engineering Sciences Center**  
**Albuquerque, NM**

Seventh Biennial Tri-Laboratory Engineering Conference  
May 7-10, 2007

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin Company,  
for the United States Department of Energy under contract DE-AC04-94AL85000.

# Calore Thermal Analysis Code

- ***Calore* is general purpose transient 3-D finite element code that models**
  - Anisotropic heat conduction
  - Capacitance or energy storage
  - Energy source (may be driven by chemical kinetics)
  - Enclosure radiation with non participating medium

# Verification Before Validation

- **Code Verification**-process of insuring that the implemented model equations are solved correctly
  - Assure expected convergence rates (“Bug” check)
  - Study/quantify discretization errors relevant for the code users
- **Verification** will primarily rely on analytical solutions (both classical and manufactured)
- **Both local and global error norms** will be considered

# Code Verification Coverage Test Suite

- All paths through code must be tested; this requires consultation with code authors
- It is not necessary to test all combinations of all options; this would be an insurmountable task
  - This assumes that element level conduction routines can be tested with or without capacitance
- Focus will be on testing various terms in PDE
  - Conduction, Capacitance and Source
- Boundary condition types
  - Specified temperature, specified flux, convection, far field radiation, and enclosure radiation
- Properly chosen verification problems can also be used as code confirmation problems

# Analytical Solution Techniques

- Classical methods (Separation of Variables, Green's functions, ...)
  - Funded work at MSU on development of software to evaluate Green's function solution in parallelepiped
  - Boundary conditions must be uniform on six faces but can have any combination of specified flux, specified temperature, and convection (initial version with non-uniform/time dependence complete)
  - Software potentially contains thousands of independent analytical solutions
  - Solution for both Temperature and Heat Flux
  - Accuracy demonstrated to be (at least) 8 significant figures
  - Internal verification of analytical solution
  - Combined with a transformation to address nonlinear problems

# Analytical Solution Techniques (con't)

- **Manufactured solutions**
  - Substitute analytical solution into energy equation with source term
  - Solve for source term consistent with analytical solution and boundary/initial conditions
  - Source term may be complex analytical function
  - Determine boundary/initial conditions directly from proposed analytical solution
  - Implement *calore* user defined source subroutine
  - Usually requires user defined subroutines for BC's/IC's

## Global Error Norms

- **Calore uses Linear Galerkin FEM**
- **Theoretical error (linear elements)**

$$\|e\|_s \equiv \|T - T^{Num}\|_s \leq Ch^\mu \|T\|_r \quad 0 \leq s \leq m$$

- $\mu = \min(2-s, r-s)$
- $s$  – highest derivative in the norm
- $m=1$  –  $C^0$  elements

- **Assuming integrable 2<sup>nd</sup> derivative for the analytical solution ( $r \geq 2$ )**

$$\|e\|_0 \leq Ch^2 \|T\|_2 = C'h^2$$

$$\|e\|_\infty \leq Ch^2 |\log h| \|T\|_{k+1,\infty}$$

$$\|e\|_1 \leq Ch^1 \|T\|_2 = C'h^1$$

**Calore has the capability to calculate all three norms given a user provided analytical solution**

# Engineering Error Norms

- **Engineering analysts prefer maximum error (at a given location)**
- **Theory not as well developed but useful computational results are being produced**

$$e = \left| T(\mathbf{x}_e, t) - T^{Num}(\mathbf{x}_e, t) \right|$$

$\mathbf{x}_e$  – location of interest

- **All verification problems presented will have engineering error norm results; some also have global error norm results**

# General Description of Verification Problems

- A recurring theme at Sandia is “weapon in a fire”
- Temperature range for these problems is about 300-1300K
- Verification problem temperature range generally consistent with “weapon in a fire”
- Error norm results could be made dimensionless
- Instead, problems were left dimensional so that results will be useful for both code developers and thermal analysts

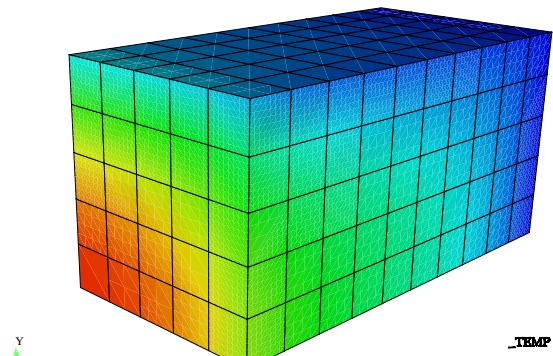

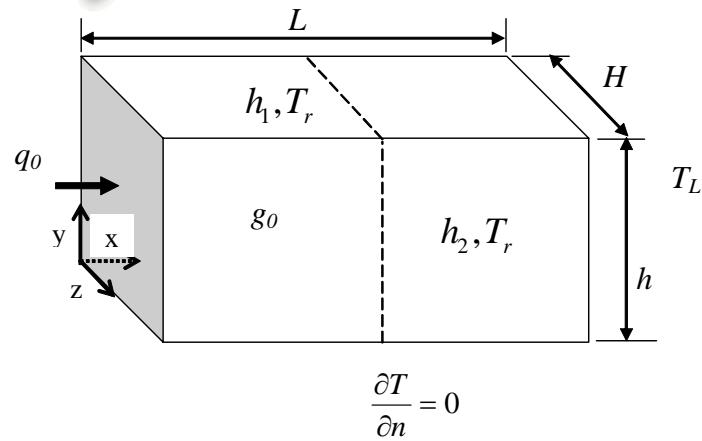

# Calore Verification Suite

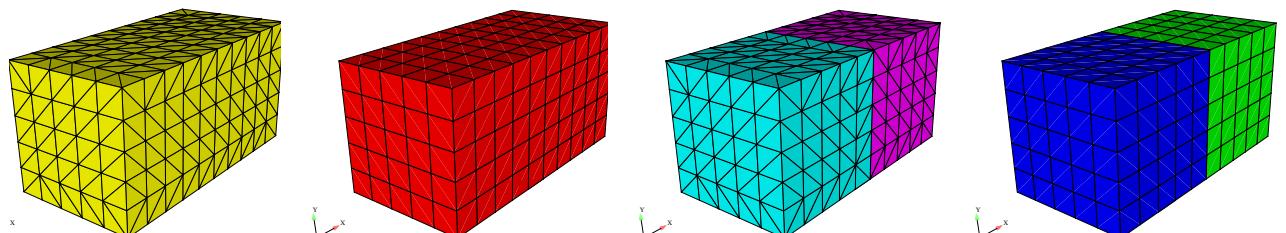

Model Eqn	Comments
Geometric	<b>Volume errors in Cyl/Sph region</b>
Conduction	<b>SS Linear, 1D Cyl/Sph, T-BCs</b> <b>SS Linear, 1D Cyl, Vol Src, T-BCs</b> <b>SS Linear, 2D Rect, Vol Src, (T, q, h) BCs</b> <b>SS Linear, 3D Rect, Vol Src, (T, q, h) BCs, Contact, Adaptivity</b> <b>SS Linear, 2D Rect, Anisotropic, user Vol Src., T-BCs</b> <b>Trans Linear, 1D Rect, q-BCs</b> <b>Trans Nonlinear, 1D Rect, <math>k(T)</math>, user q-BCs</b> <b>Trans Nonlinear, 1D Rect, <math>Cp(T)</math>, user q-BCs</b> <b>Trans Nonlinear, 1D Rect, <math>k(T)</math>, <math>Cp(T)</math>, q-BCs</b>
Chemical Kinetics (interfaced with Conduction)	<b>2-reactions, isothermal</b>
Conduction/ Contact Resistance	<b>SS Linear, 1D</b>
Conduction/ Enclosure Radiation	<b>SS Conduction, 1D Concentric Sph Shell, T-BCs</b>

# Suite of Verification Cases

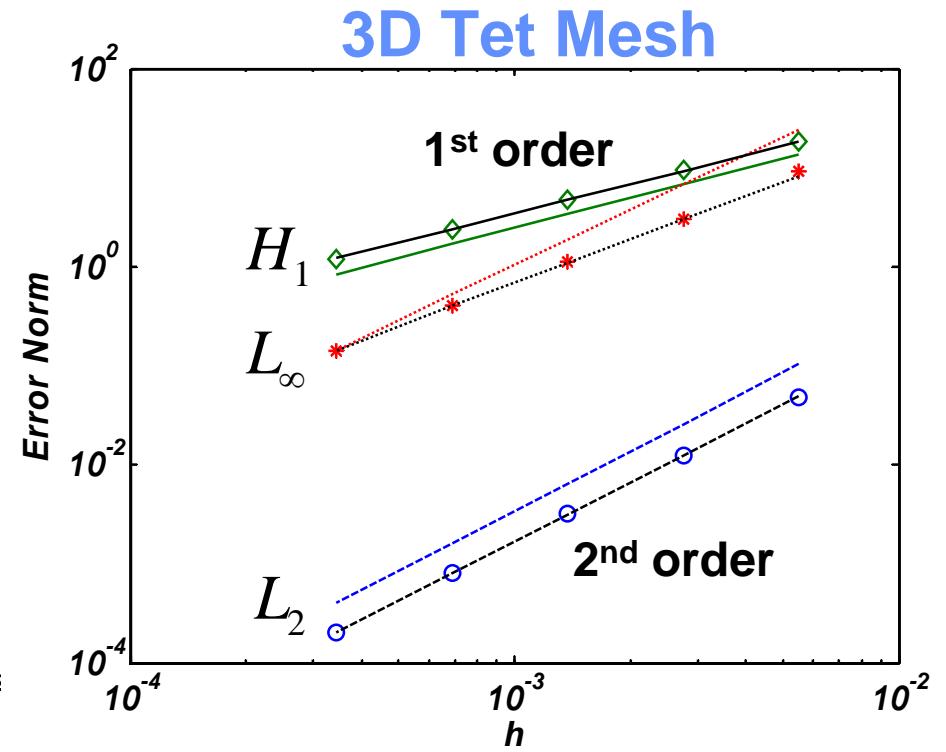

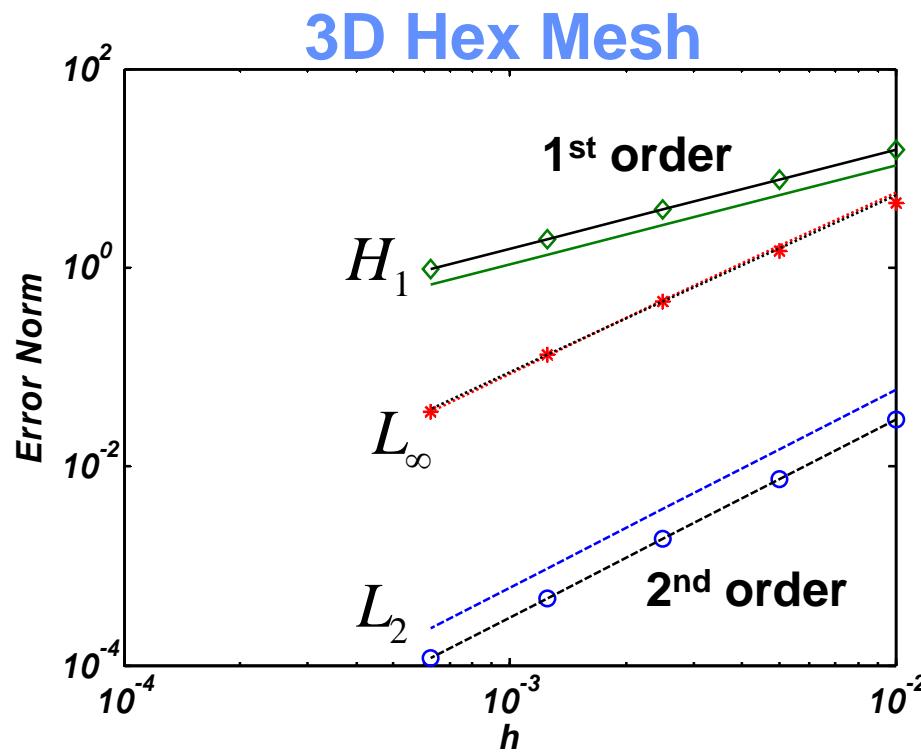

Case	PDE		Mesh		Contact		Refine	
	Steady	Trans	Hex	Tet	None	Tied	Uniform	Adp
1	X			X	X		X	
2	X			X	X		X	
3		$x(2^{\text{nd}})$	X		X		X	
4		$x(2^{\text{nd}})$		X	X		X	
5		$x(1^{\text{st}})$		X	X		X	
6	X			X		X	X	
7	X				X	X	X	
8	X		X			X	X	
9		$x(2^{\text{nd}})$		X		X	X	
10	X		X		X			X
11	X			X	X			X
12		$x(2^{\text{nd}})$	X		X			X
13		$x(2^{\text{nd}})$		X	X			X
14	X		X			X		X

All cases with Tet elements had less than 2<sup>nd</sup> order convergence for  $L_\infty$  Norm

## Convergence rate obtained for $L_{\infty}$ Norm with Tet elements was less than 2<sup>nd</sup> order

- Expected convergence (for linear elements)

$$L_{\infty} \leq h^2 |\log(h)|$$

- Other norms ( $L_2$  and  $H_1$ ) exhibit expected convergence for Tet elements
- $L_{\infty}$  exhibits expected convergence for Hex elements
- Various possible explanations for non optimal convergence with Tet elements have been examined
  - Analytical solution has been checked
  - Calculation of the norm has been independently verified
  - 2D case exhibits same outcome
    - » Tris give less than optimal, Quad give optimal convergence
  - Mesh quality has been investigated (2D case)

Why would the  $L_{\infty}$  Norm not follow expected convergence for Tet mesh while other norms do??

# Verification of Nonlinear Transient Heat Conduction

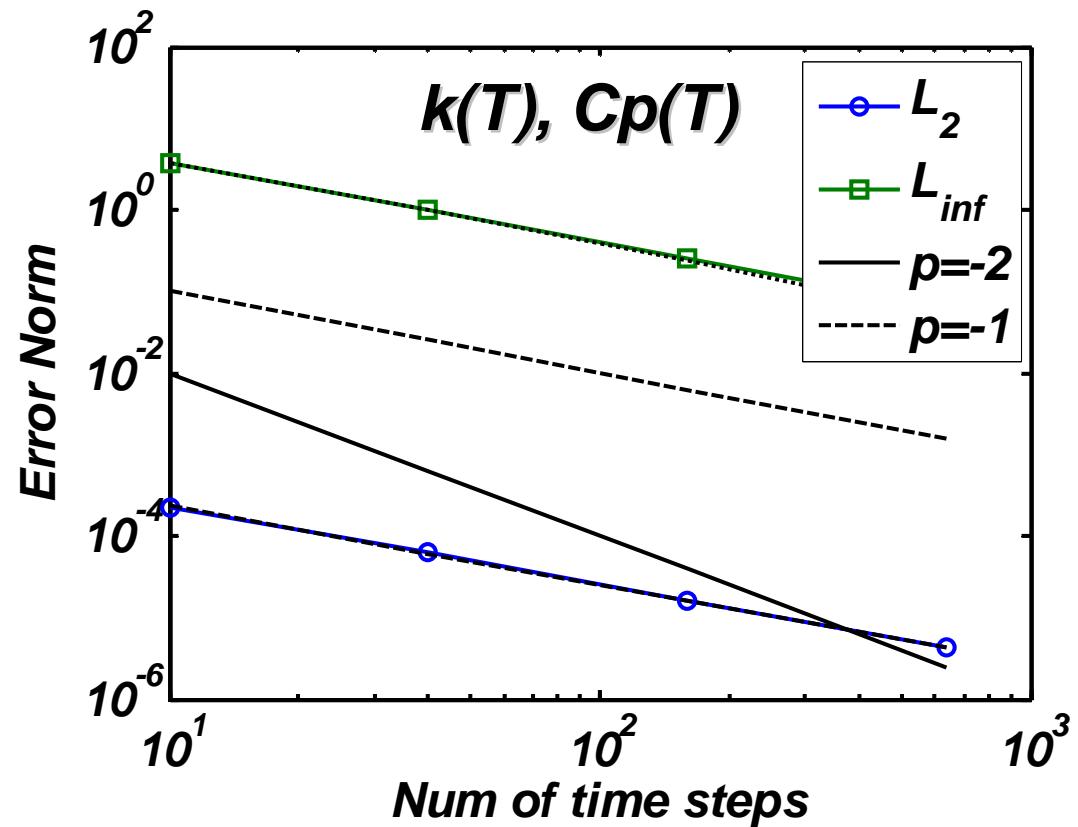

- Nonlinearity due to temperature dependence of the thermal properties (thermal conductivity,  $k$ , and specific heat,  $C_p$ )

$$\frac{\partial}{\partial x} \left( k \frac{\partial T}{\partial x} \right) = \rho C_p \frac{\partial T}{\partial t}$$

- Suite of Verification problems conducted
  - $k$ -constant,  $C_p$ -constant
  - $k(T)$ ,  $C_p$ -constant
  - $k$ -constant,  $C_p(T)$
  - $k(T)$ ,  $C_p(T)$
- Temp Depend of properties was linear (range selected to give significant property variation for T variation)
- Space and time discretization refined simultaneously
  - 2<sup>nd</sup> order time integrator ( $\Delta t/h = \text{constant}$ )
  - 1<sup>st</sup> order time integrator ( $\Delta t/h^2 = \text{constant}$ )

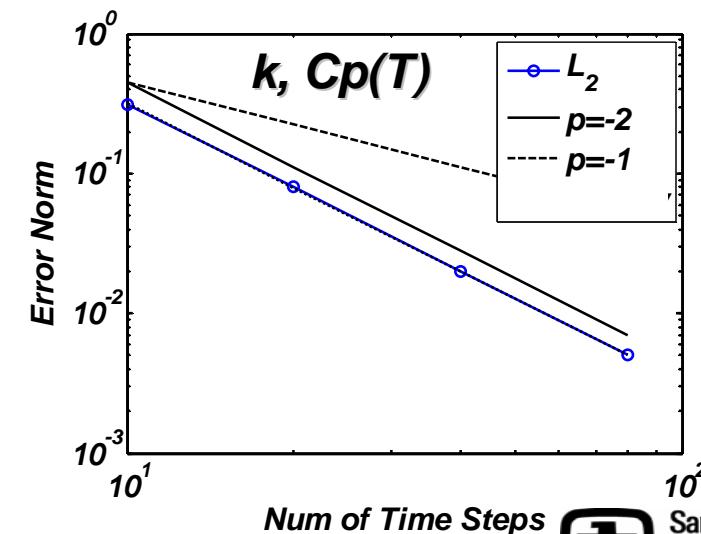

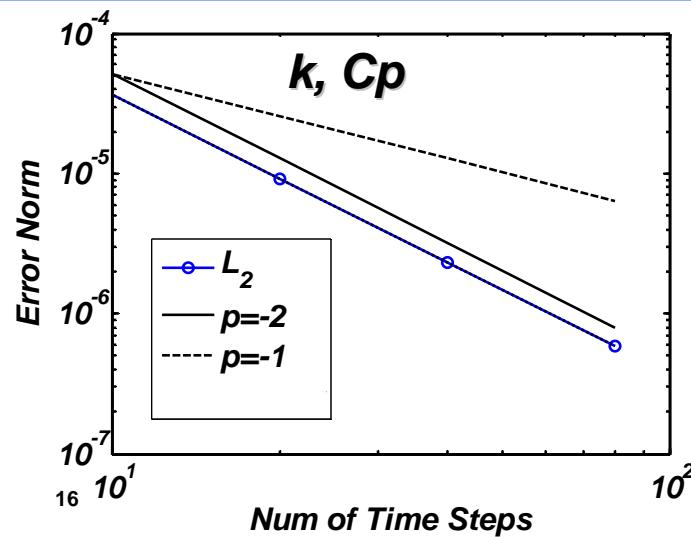

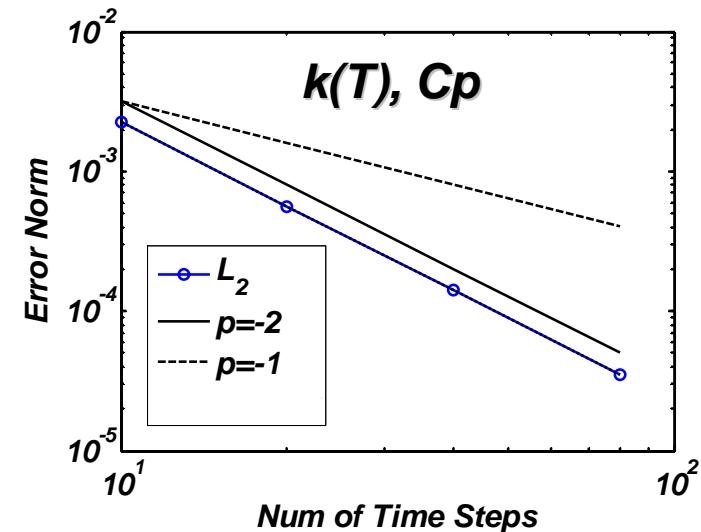

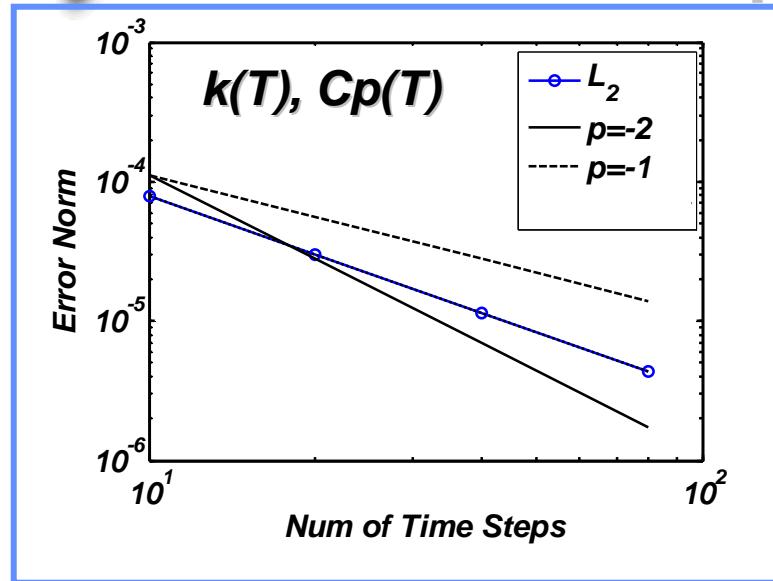

# Implicit (1<sup>st</sup> order) time integrator shows expected convergence rates for all problems

# Trapezoid (2<sup>nd</sup> order) time integrator shows unexpected convergence rates when both properties temp depend

Sandia  
National  
Laboratories

# Summary of Verification for Nonlinear Heat Conduction

- **Implicit time integrator is 1<sup>st</sup> order for all problems studied**
- **Fully nonlinear problem (both  $k(T), Cp(T)$ ) has less than 2<sup>nd</sup> order convergence ( $p=1.4$ )**
- **Linear and partially nonlinear problems ( $k(T)$  or  $Cp(T)$ ) demonstrate 2<sup>nd</sup> order convergence**
- **Process has been checked to insure accuracy of analytical solution and norm calculation**
- **Fully nonlinear problem has been run in two other codes – one gives 2<sup>nd</sup> order, one doesn't**
- **Additional problem has shown 2<sup>nd</sup> order convergence for the Trapezoid integrator**

Should we expect 2nd order convergence for the Trapezoid time integrator for the Fully nonlinear problems???

# Summary of Calore Verification

- **Order of convergence is a sensitive metric for code verification**
  - $L_\infty$  has shown to be the most sensitive
- **When expected convergence rates are not obtained all parts of the process must be checked**
  - Analytical solution
  - Norm calculation
  - Basis for the expected convergence (theory)
