## Abstract

Pinhole photography has made major contributions to astrophysics through the use of “coded apertures”. Coded apertures were instrumental in locating gamma-ray bursts and proving that they originate in far away galaxies, some from the birth of black holes from the first stars that formed just after the big bang.

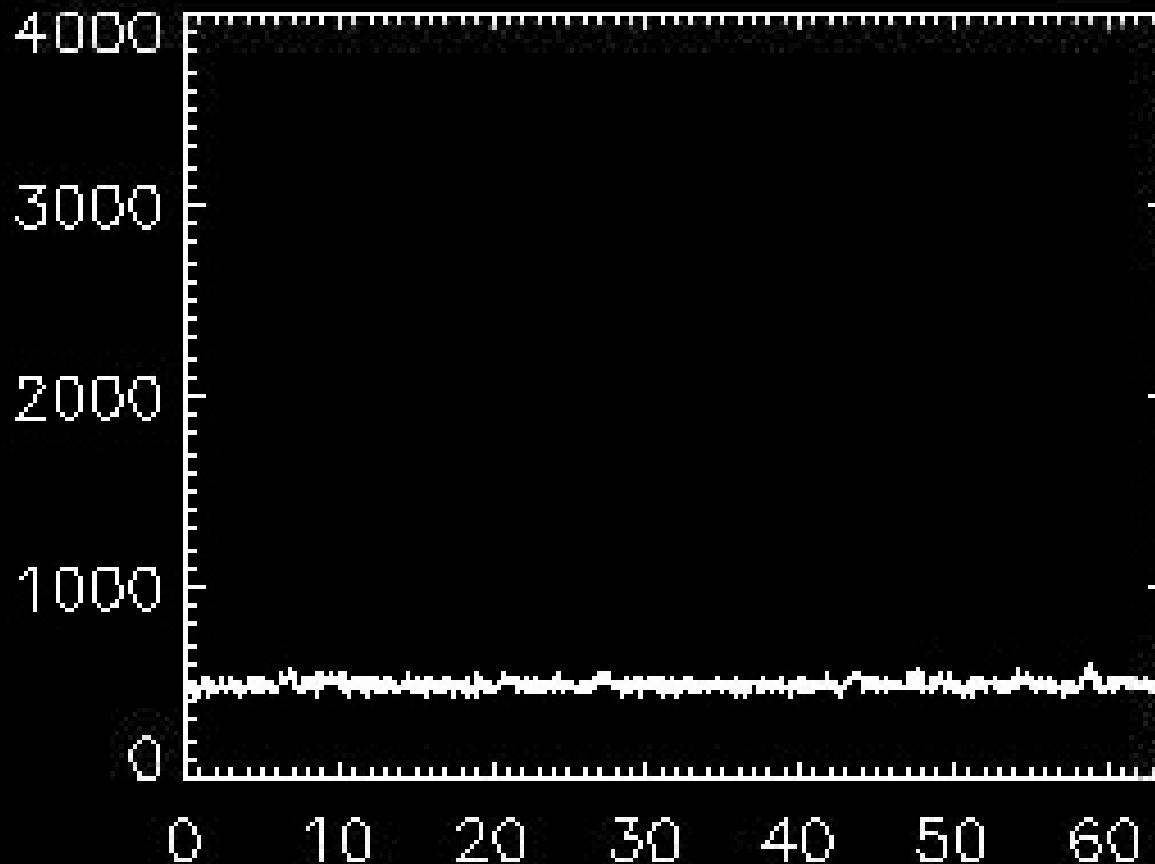

It started with the 1963 treaty to stop nuclear weapon testing

**The Vela satellites were launched to look for x-rays and gamma-rays from a hidden nuclear test.**

**Should be easy: stars were thought to be steady and certainly not emit x-rays or gamma-rays.**

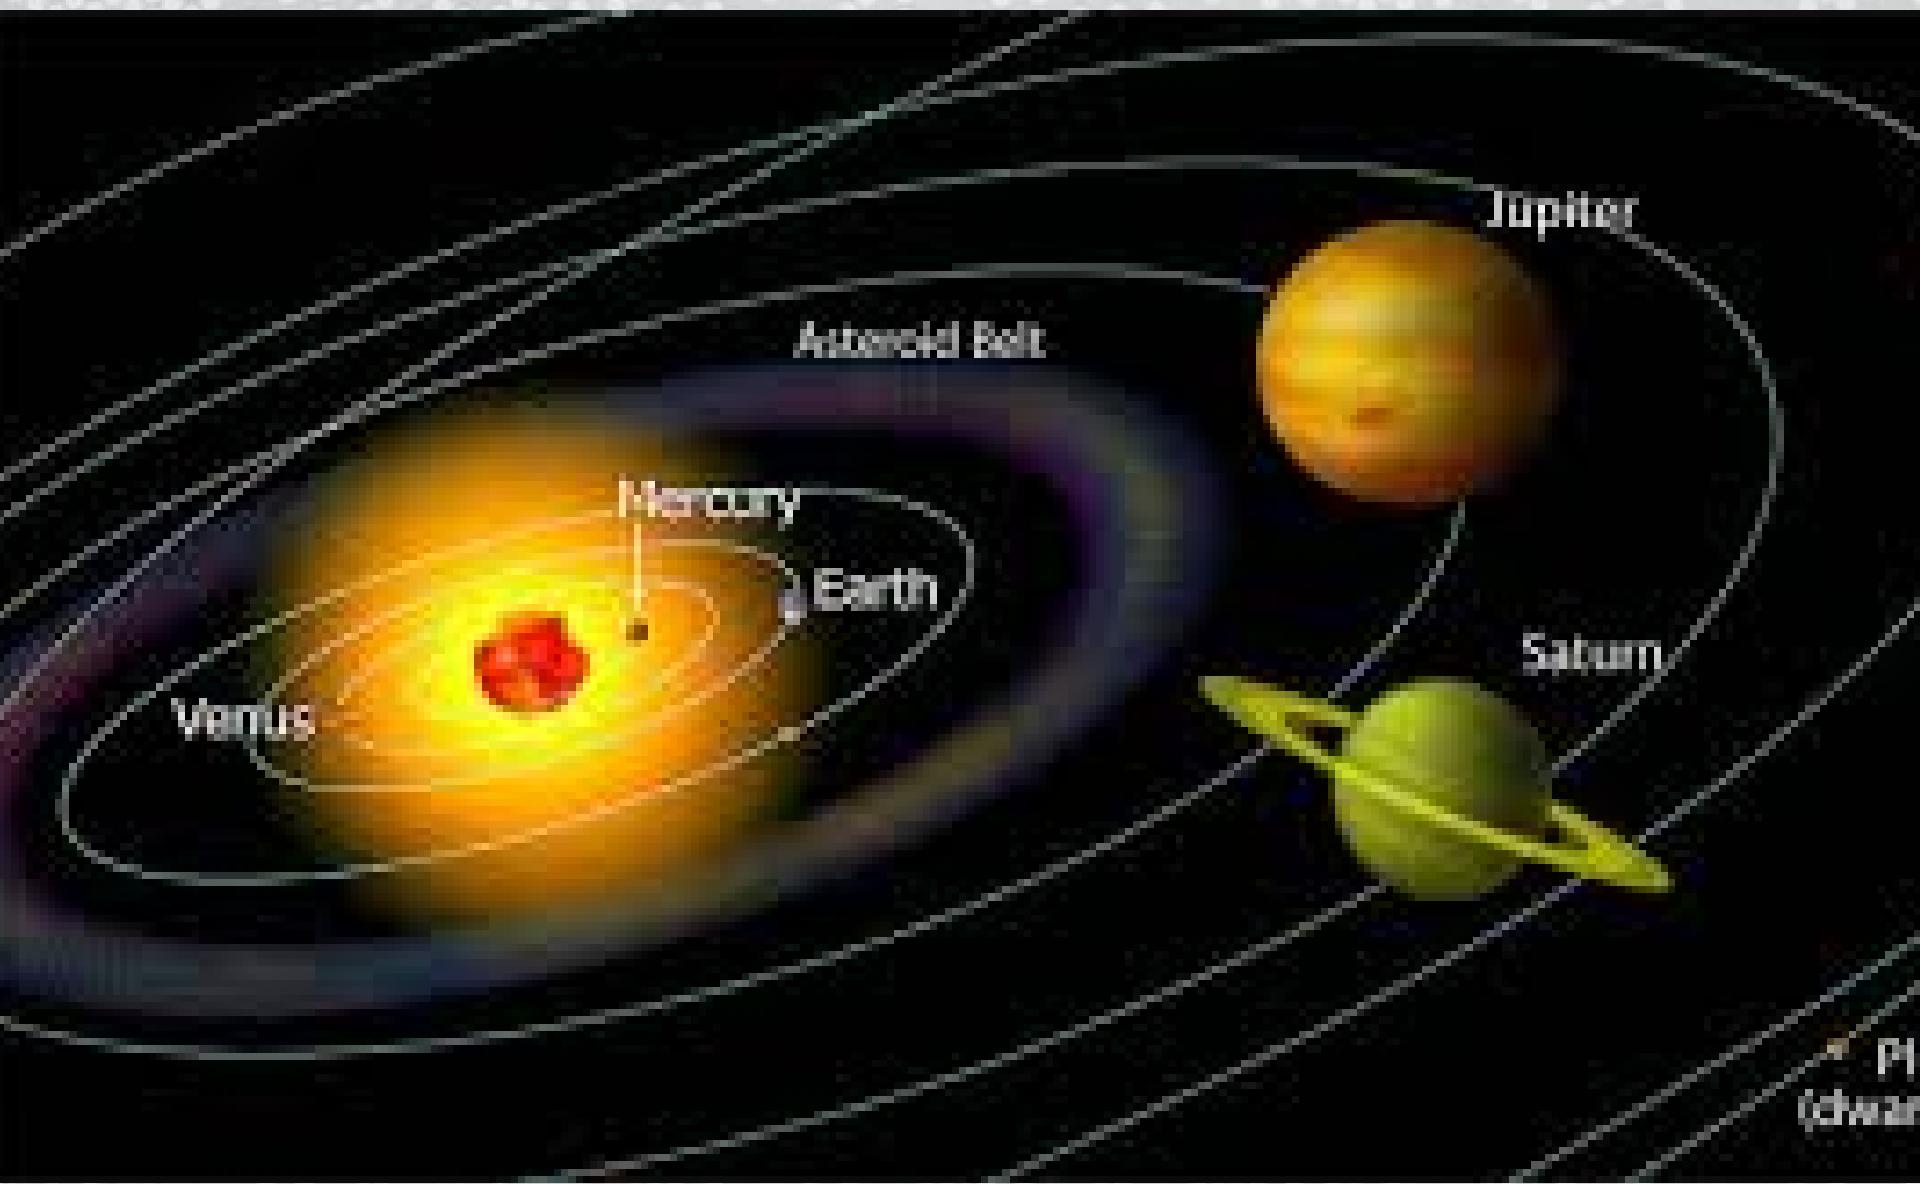

# What does a gamma-ray detector see: mostly static

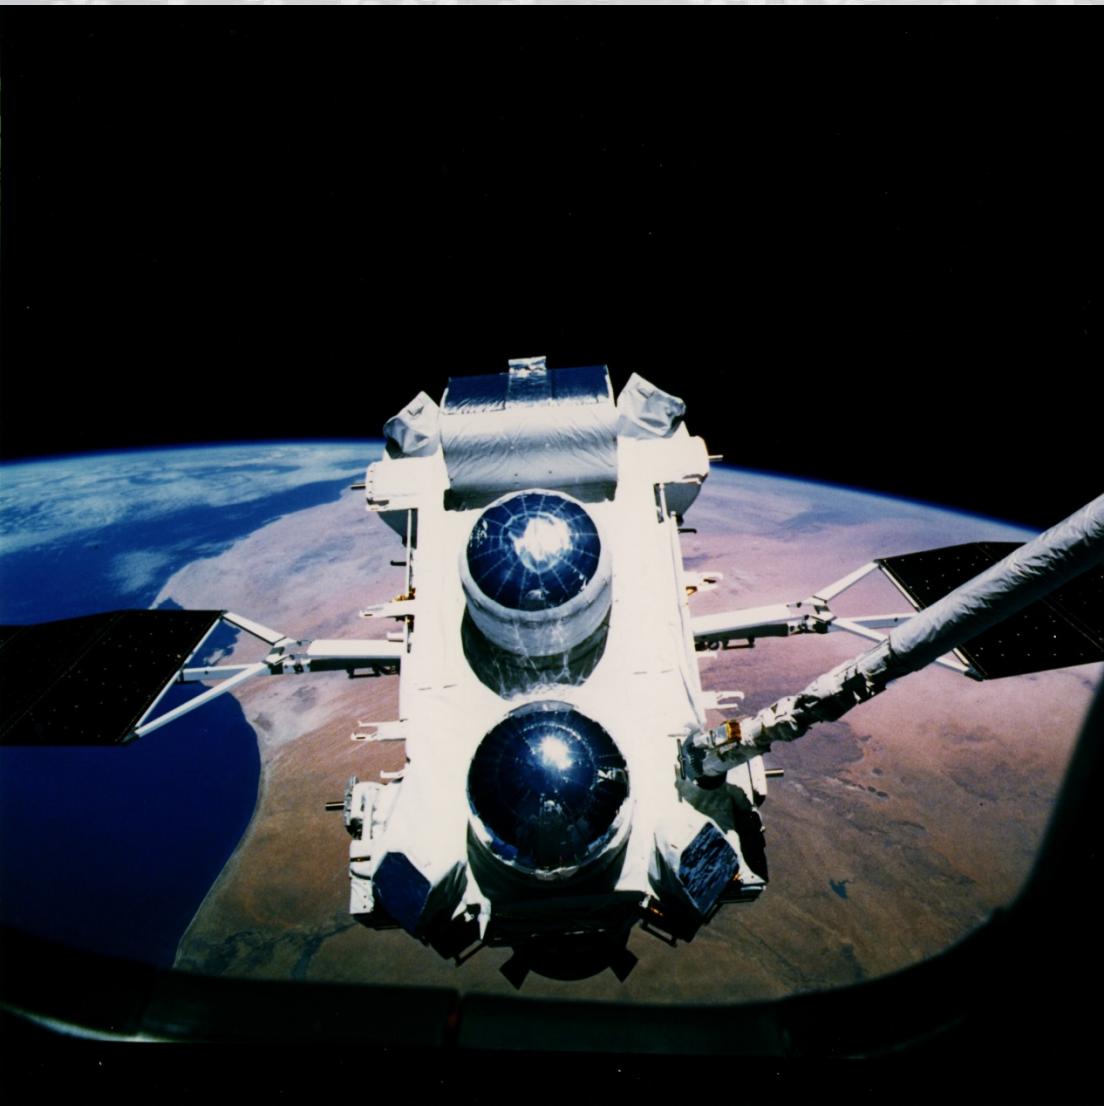

# The Times GRBs hit the satellites gives direction

# The Times GRBs hit the satellites at other planets gives direction

# 1991: Launch of “Burst and Transient Source Experiment” BATSE

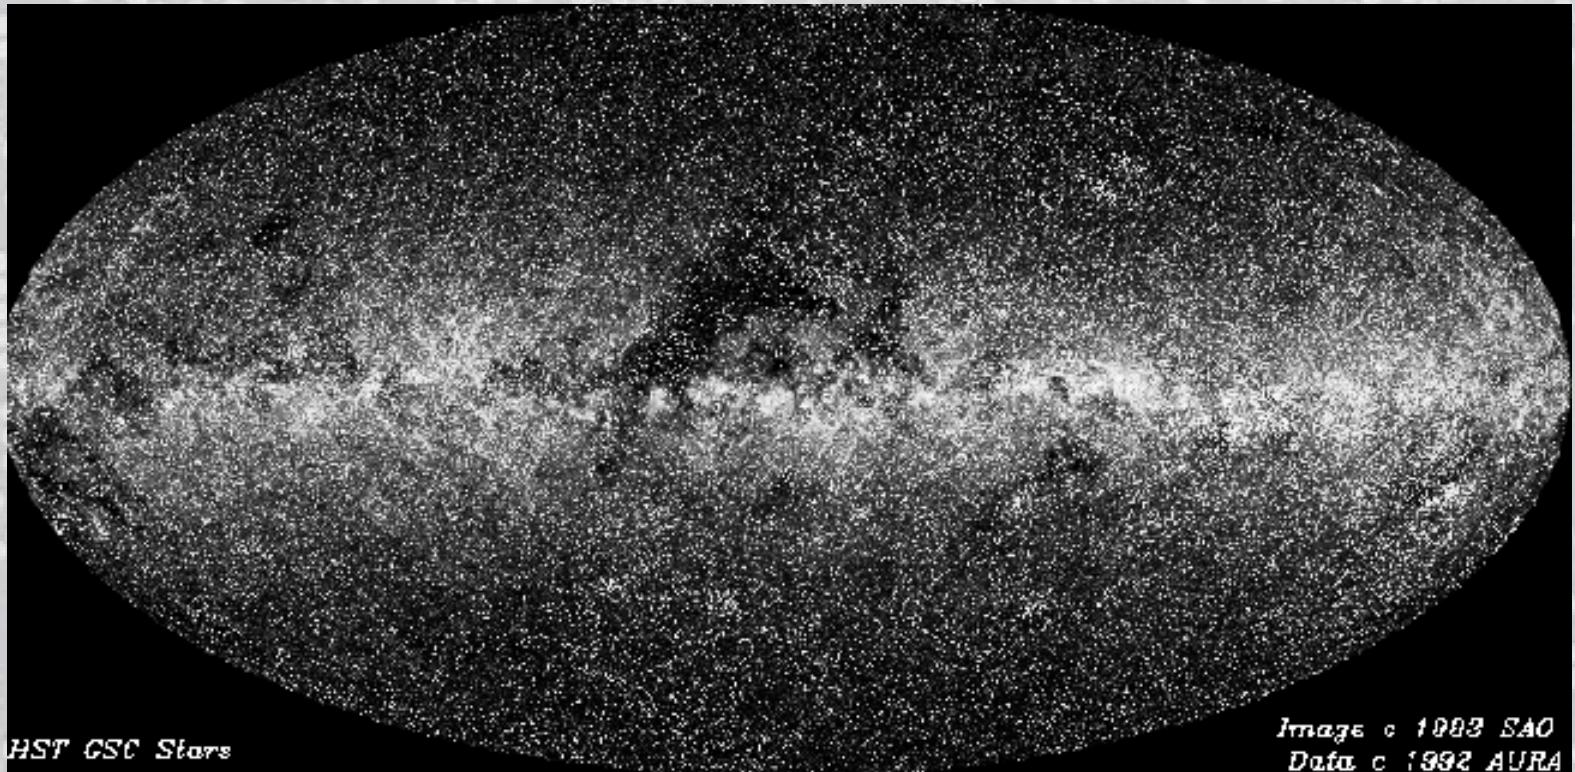

**Eight huge detectors**

**Location by different angles into the detectors**

**Found about one GRB per day**

**Many locations will give us an idea of how far away GRBs are**

Map the stars  
like a flat map  
of Earth

**Image gamma-rays  
with mirrors?**

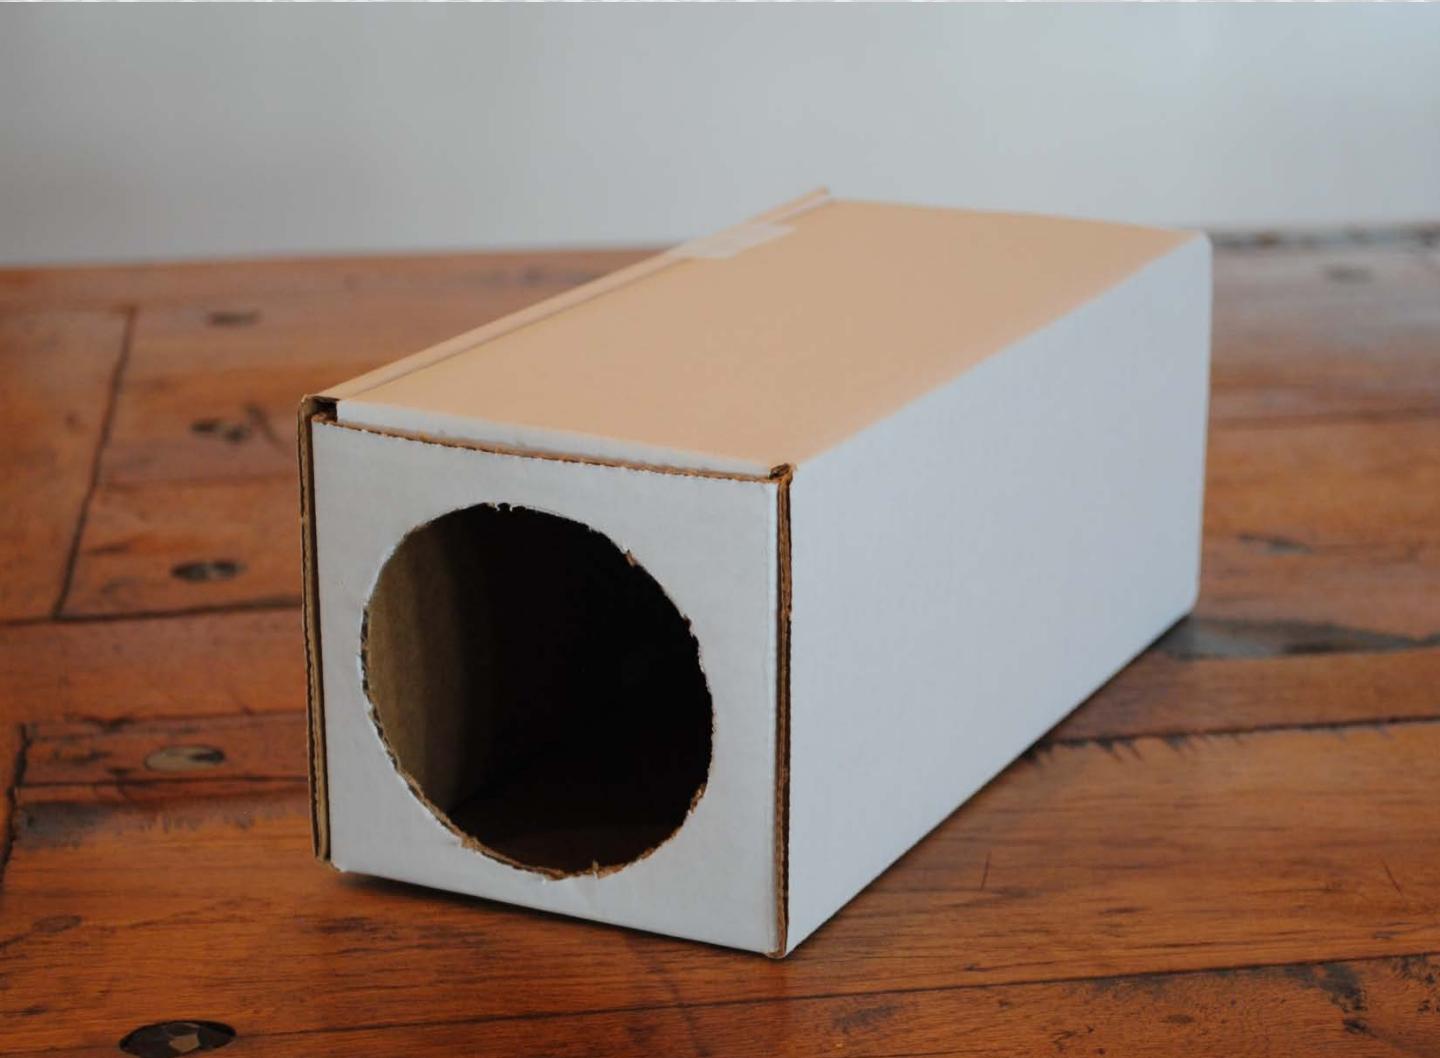

**Image gamma-rays  
with lenses?**

## Design #1: pinhole camera with small pinhole. Does not see enough x-rays.

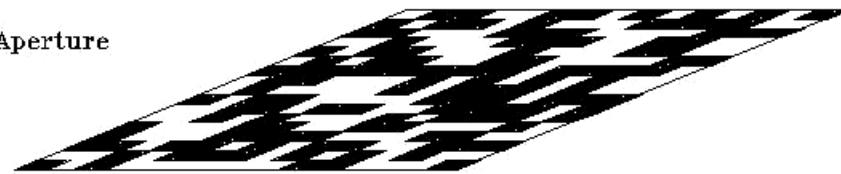

## Design #2: pinhole camera with big pinhole. No resolution.

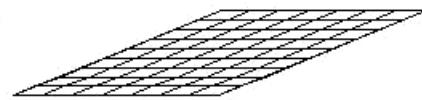

**Design #3: pinhole camera with many small pinholes. But, many overlapping images.**

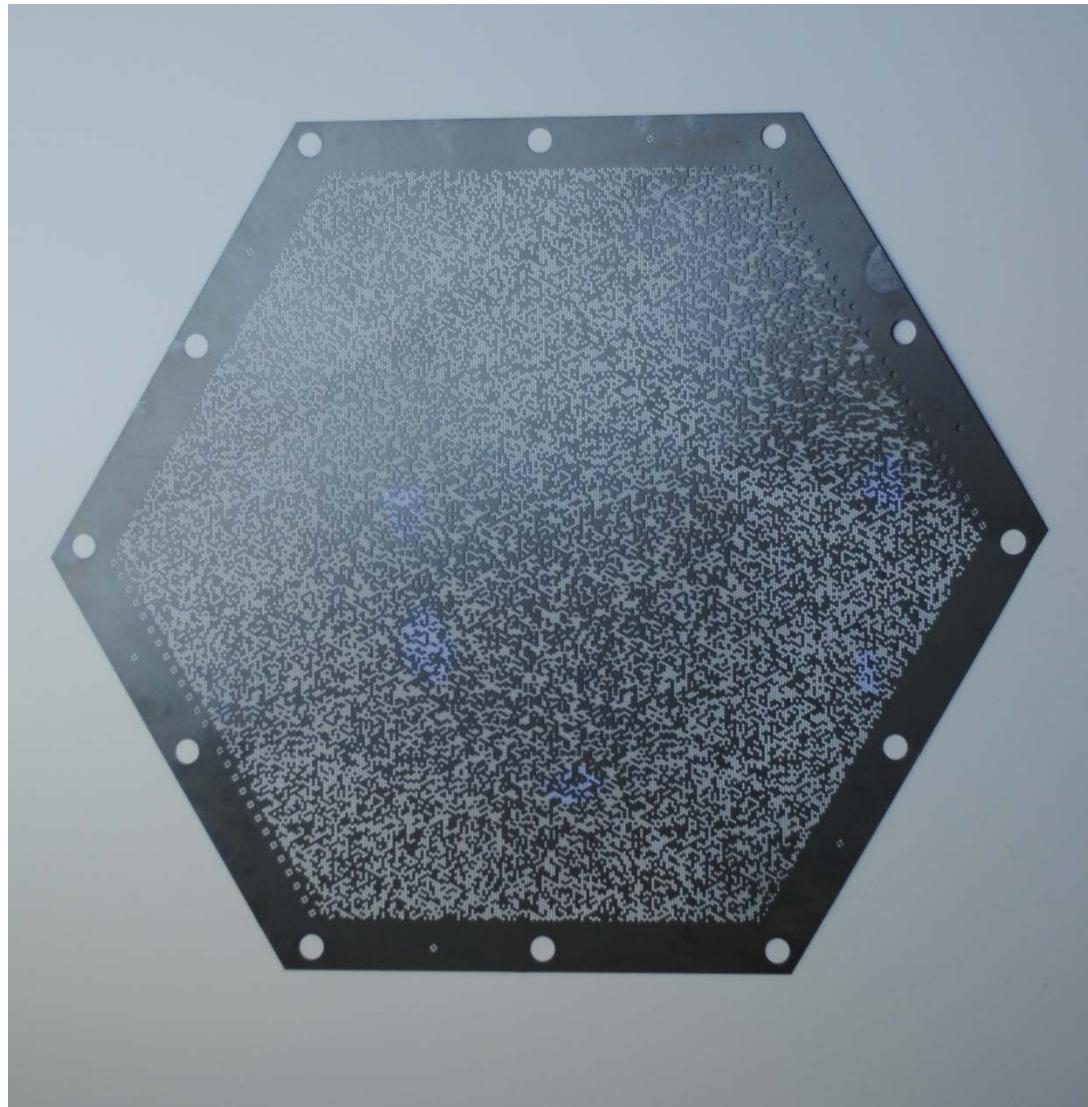

Aperture

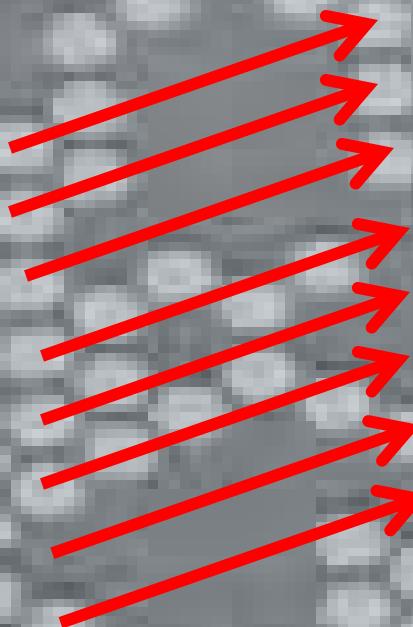

Detector

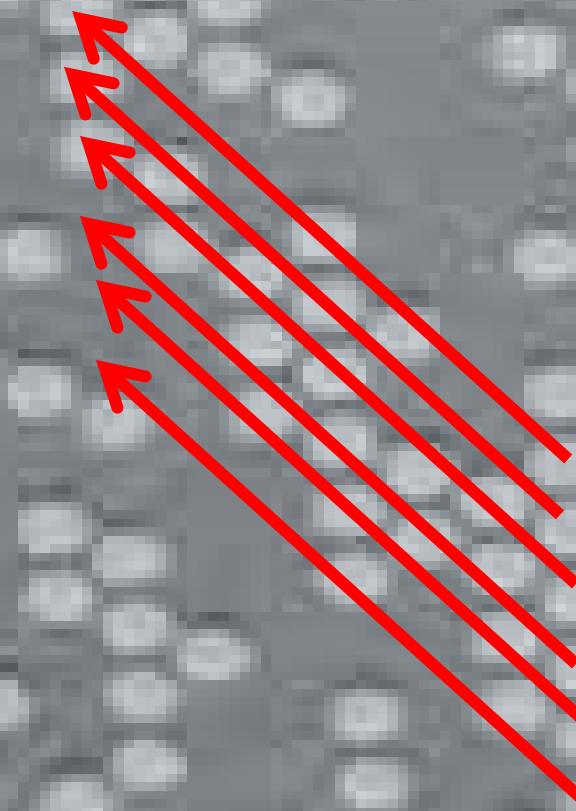

**Pattern used in URA-shuttle experiment**  
**Special mathematical function gives pinhole locations**

**Pick a vector. Move it's tail to each hole.**  
**How many times is there a hole at the head?**

**Pick another vector. Move it's tail to each hole.**  
**How many times is there a hole at the head?**

# Special mathematical properties

No matter what vector you choose, the number of times there is a hole at both ends is always exactly the same (e.g., 5201)

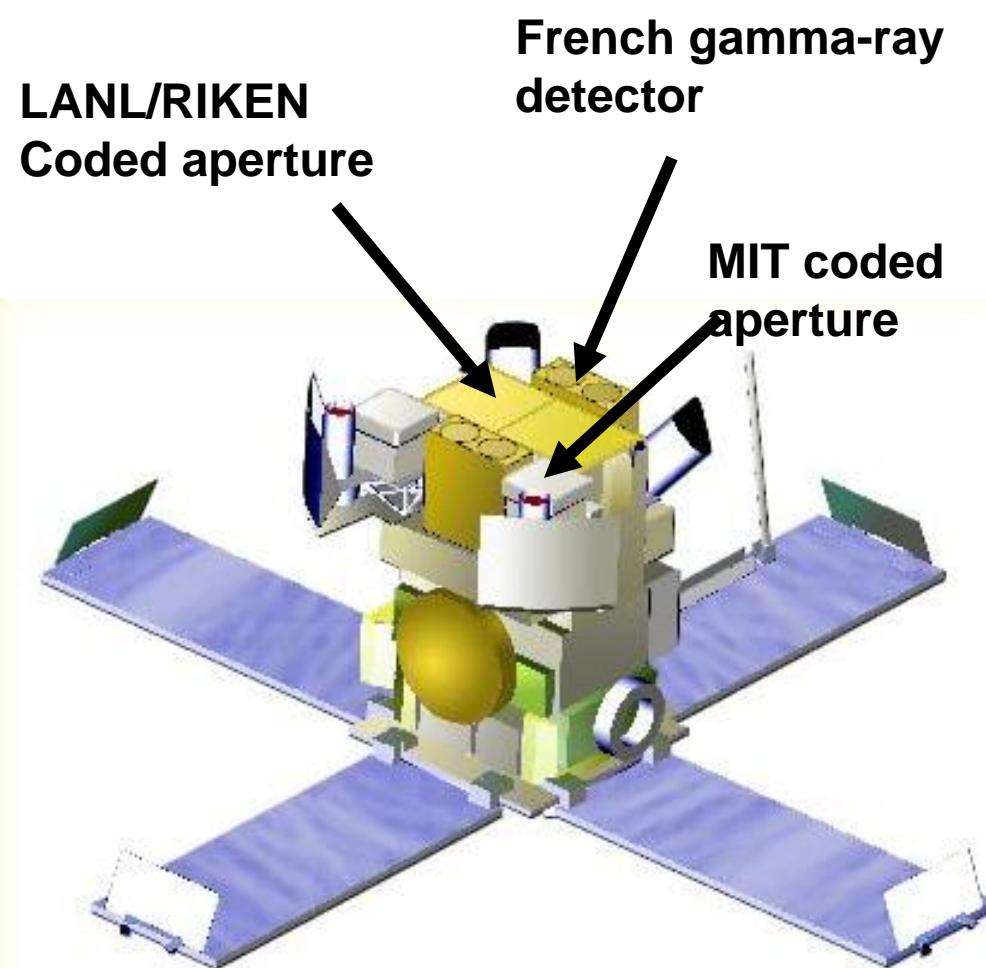

The autocorrelation is perfectly flat.

$$\mathcal{F}(A(x, y)) = 1 / \mathcal{F}(A(x, y))$$

# High Energy Transient Experiment

First satellite to autonomously locate Gamma-ray bursts

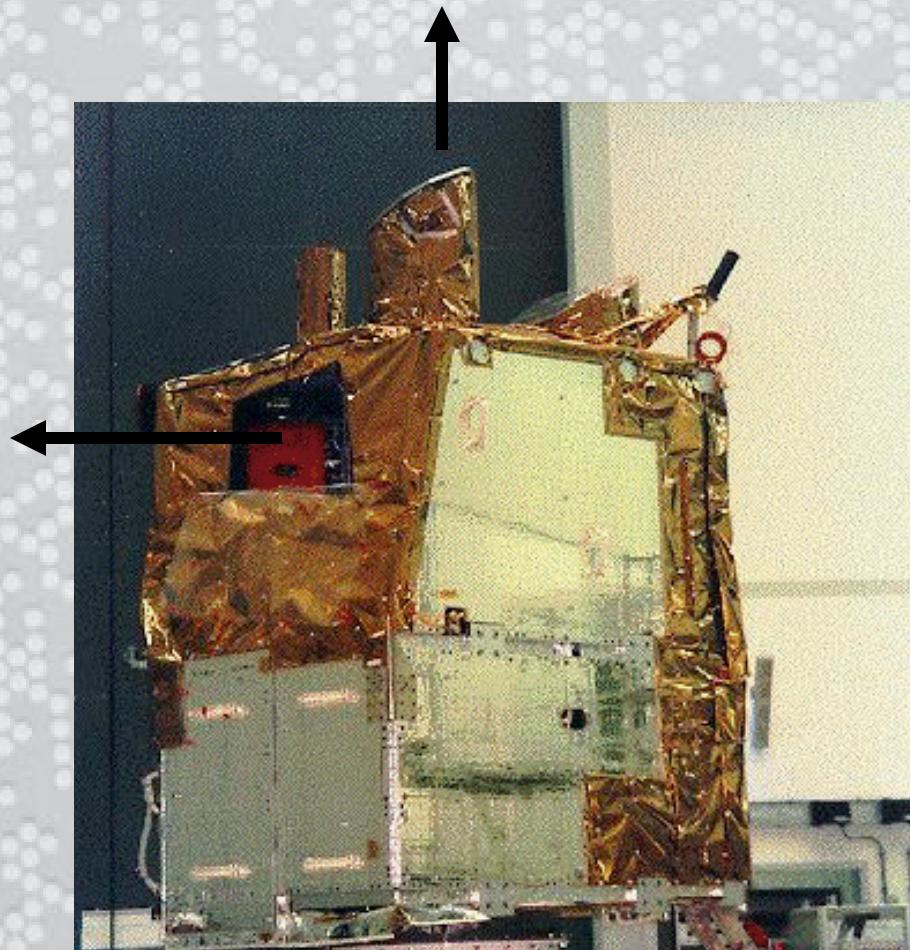

**HETE-II** 1996

**Key:** on-board software processes the coded aperture images and immediately sends to telescopes on the ground where the GRB is located

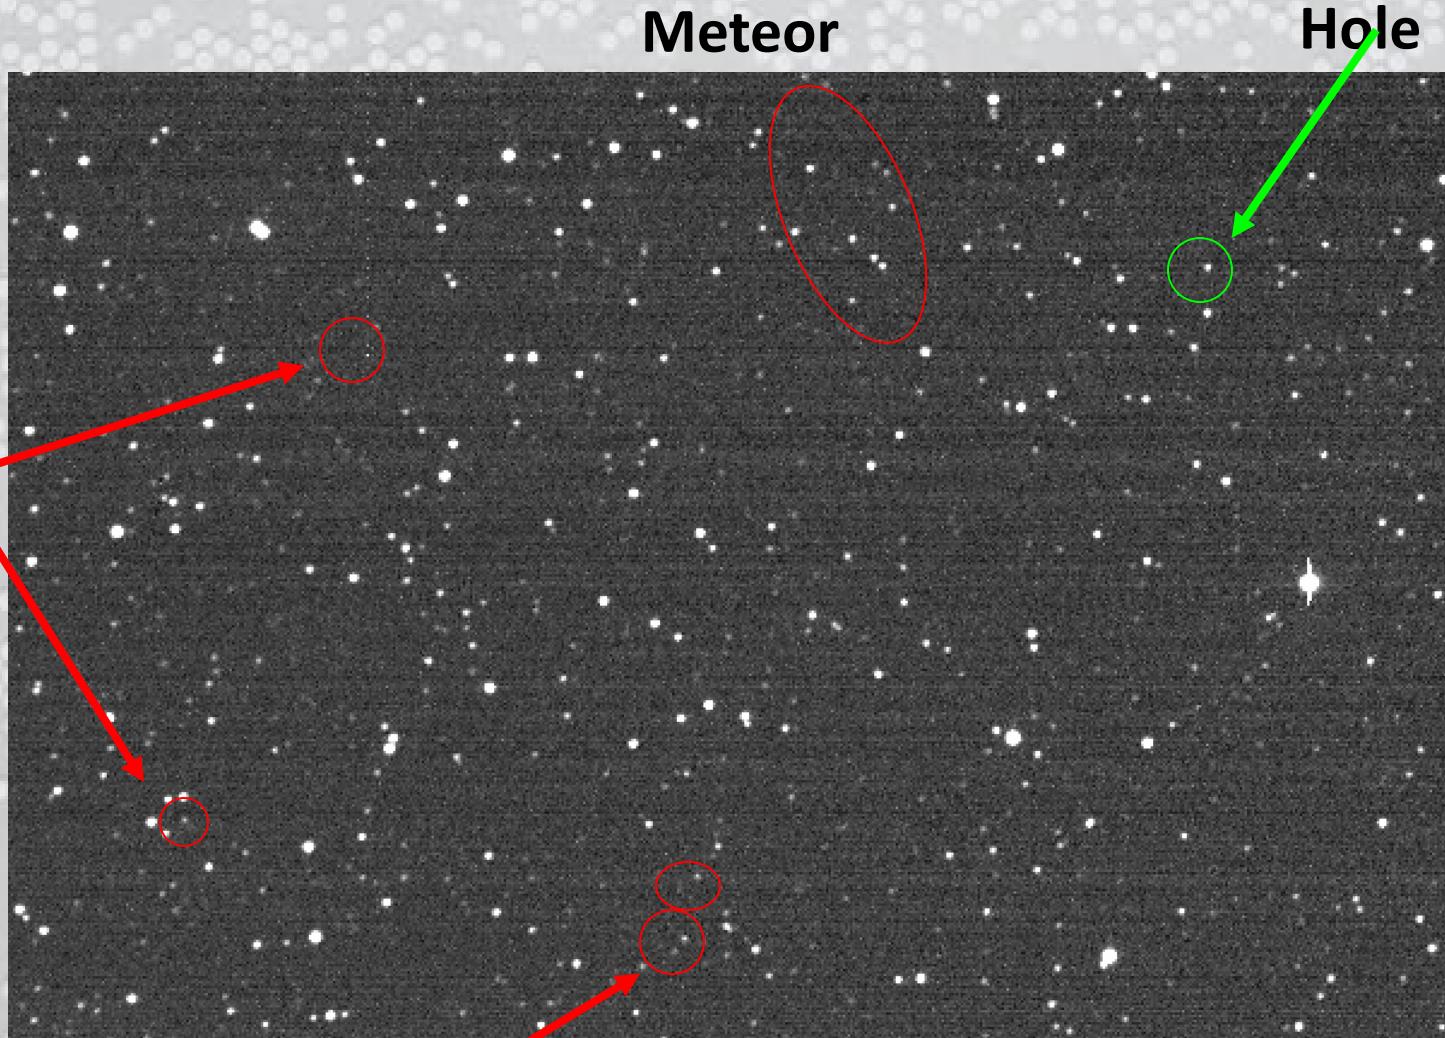

# Italian-Dutch “BeppoSax” Satellite 1997

X-ray telescopes look  
this direction

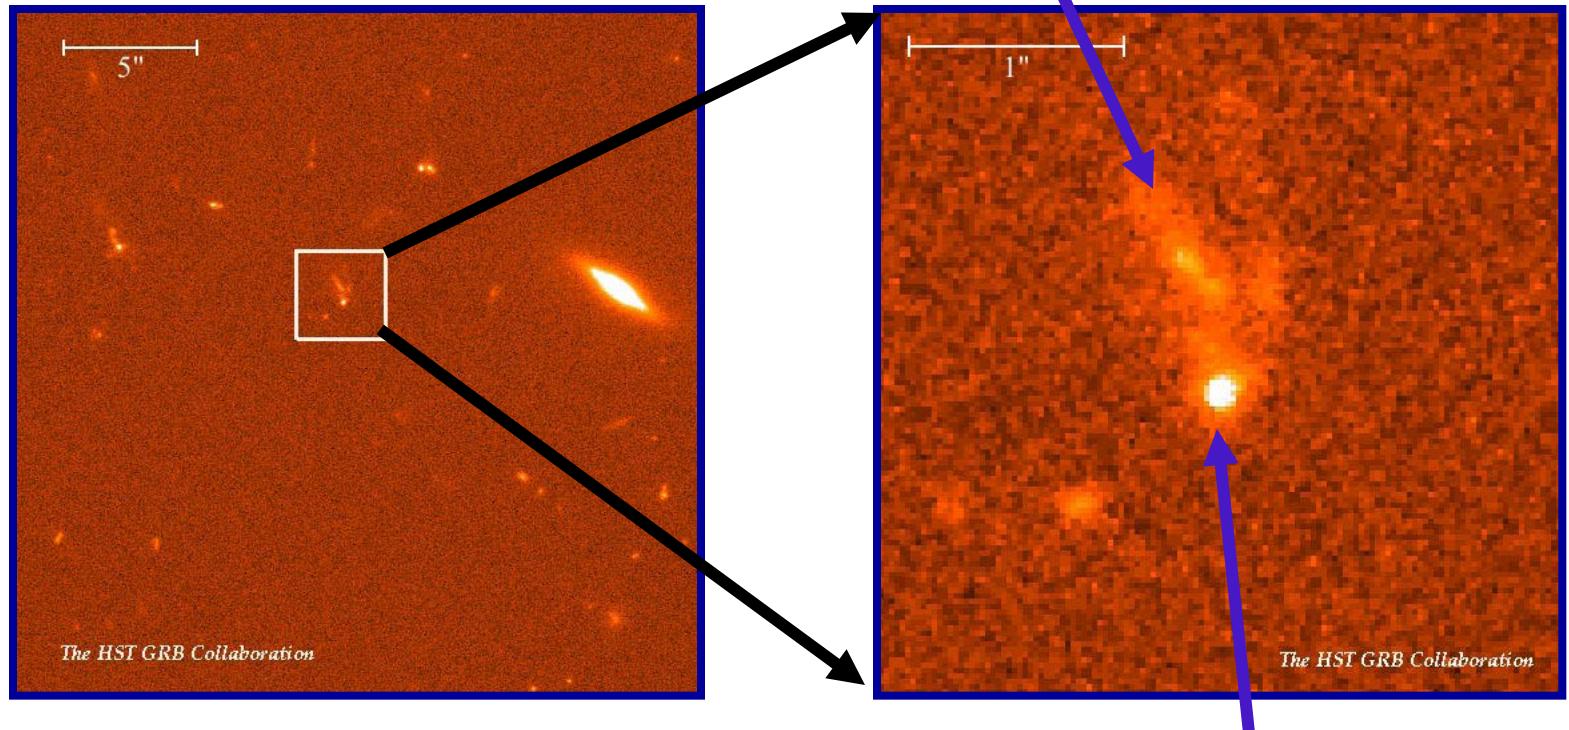

**Key: Coded aperture**  
Data sent to ground and,  
within ~8 hours, the  
satellite is repointed to  
look toward the GRB

# Six pictures over 10 minutes of a small piece of sky

# Changes in a galaxy shows which galaxy hosted the GRB

Host galaxy at 12  
billion light years !

GRB

# Need a huge reservoir of energy when 6-12 billion light years away!

$E=MC^2$  means matter can be turned into (a lot) of energy

$1 \text{ raisin} * c^2 = \text{nuclear bomb}$   
energy

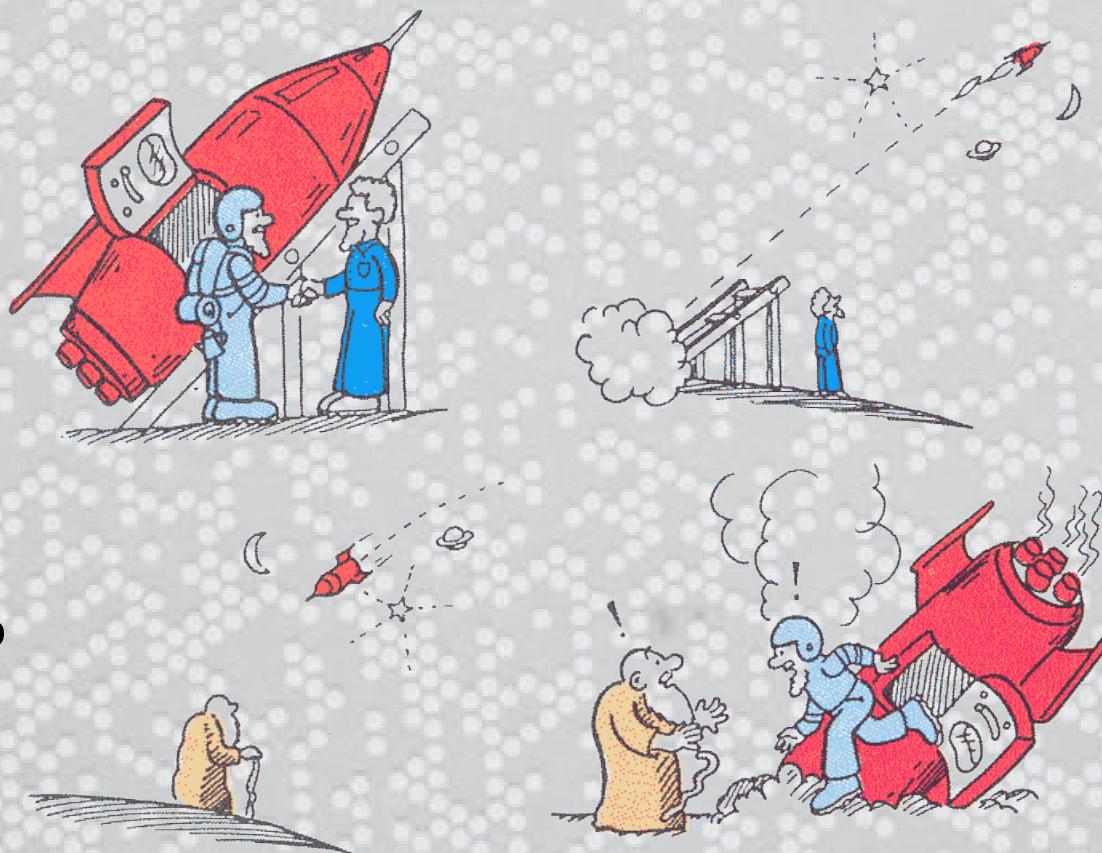

$400,000 \text{ Earths} * c^2 = \text{GRB}$   
Energy

Black Holes are at the center  
of the brightest objects in the  
universe

# The Twin paradox

One twin goes to another star, one twin stays on Earth

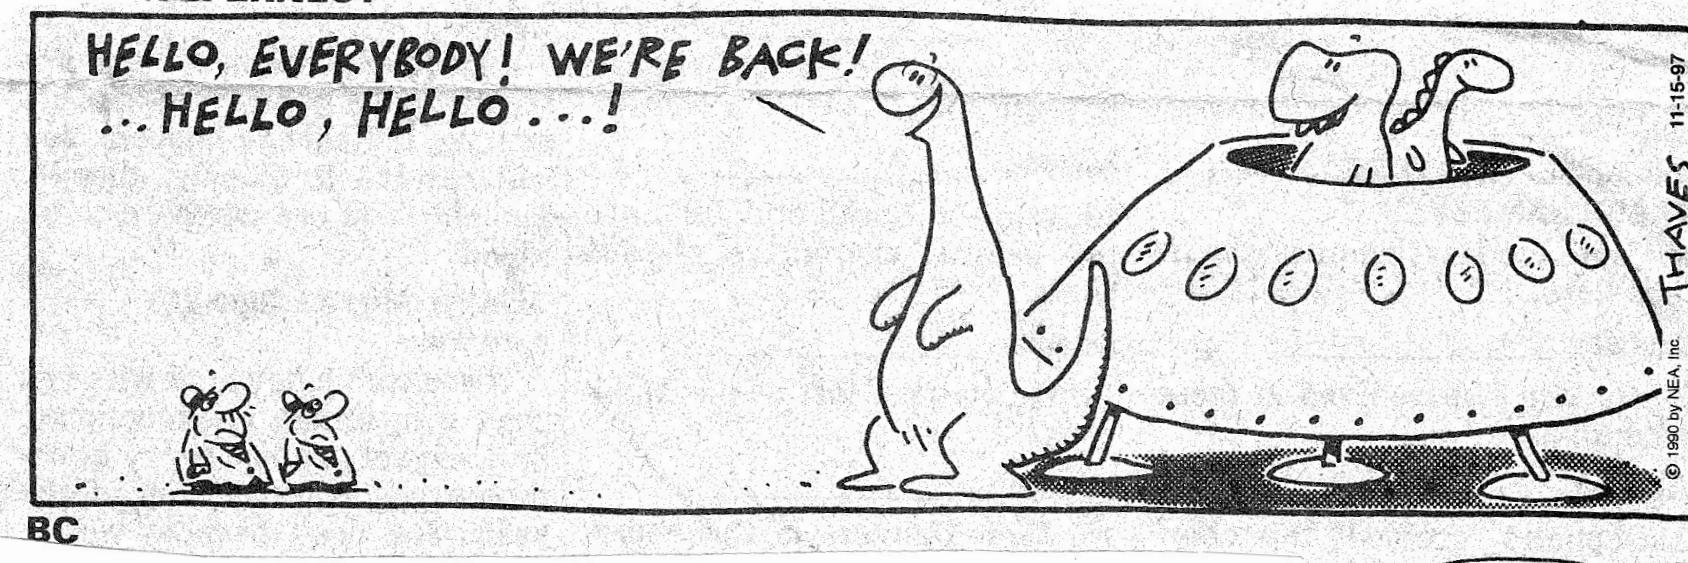

Takes 10 yrs to return

Rocket goes at 0.9999 c to a star that is 10 light-yr away: 10 yrs

The twin that stayed on the Earth is 20 years older. The rocket twin is only 3.4 months older!

Even if aliens could travel near the speed of light, they could not visit someplace and return home. Their home would be 1000's of years in their future.

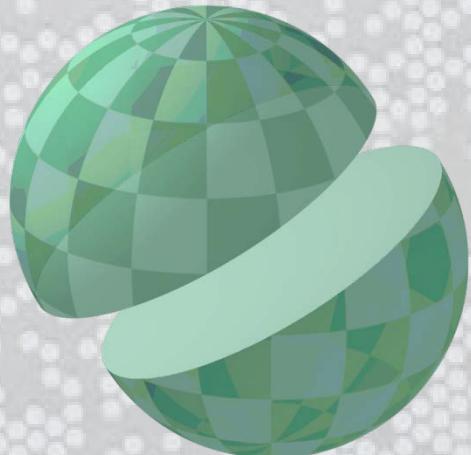

# How much space is inside a empty sphere? Two ways to find out

1) Use the  
radius:  $\text{vol} =$   
 $4\pi R^3/3$

2) Take the sphere apart  
and count how much  
space is inside

# Why are Black Holes “black”

Black holes have an infinite amount of space inside them.

At the “event horizon” it takes an infinite amount of time for light to get out of them. Thus they are black.

# Force of gravity depends on distance as $1/\text{distance}^2$

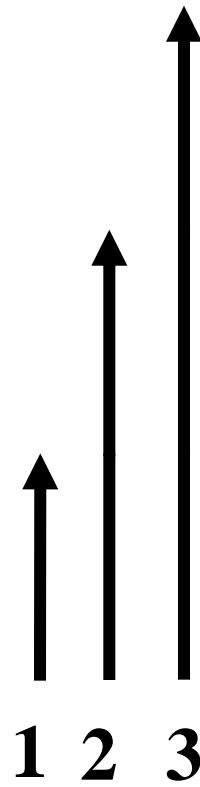

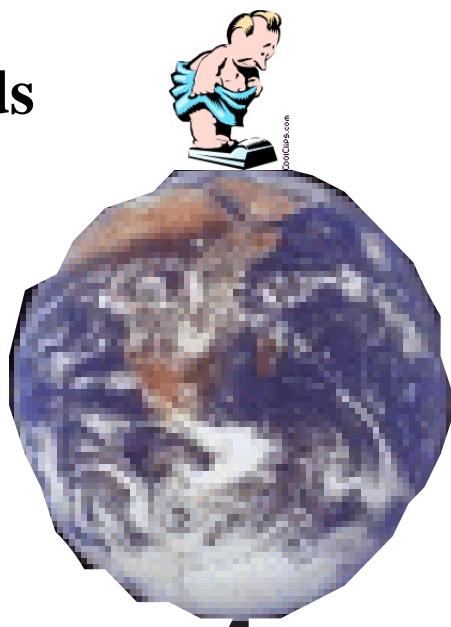

$$150 / 3^2 = 16.6 \text{ pounds}$$

$$150 / 2^2 = 37 \text{ pounds}$$

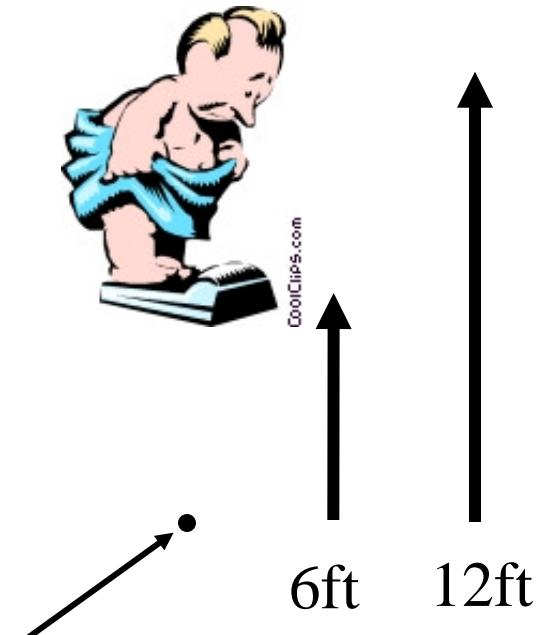

$$150 \text{ pounds}$$

$$F = \frac{M_{\text{Earth}} M_{\text{Man}}}{D^2}$$

# $1/D^2$ becomes very important near a black hole

**1 Billion Tons**

**Earth as Black hole (2 inches)**

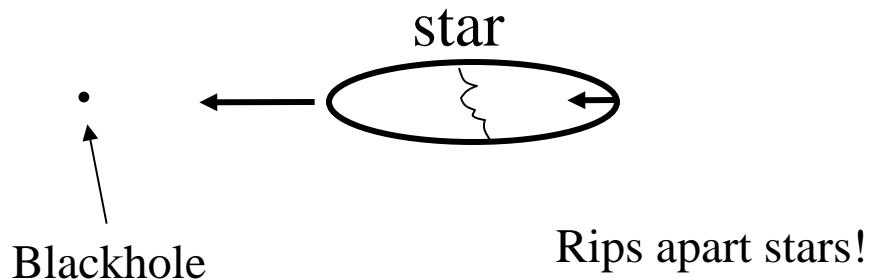

**The black hole pulls with a force of 6 Million tons on a 4 pound head**

**The black hole pulls with a force of 13 Million tons on a 2 pound foot**

# Why are black holes the brightest objects in the universe?

Gravity decreases with distance ( $1/\text{distance}^2$ )

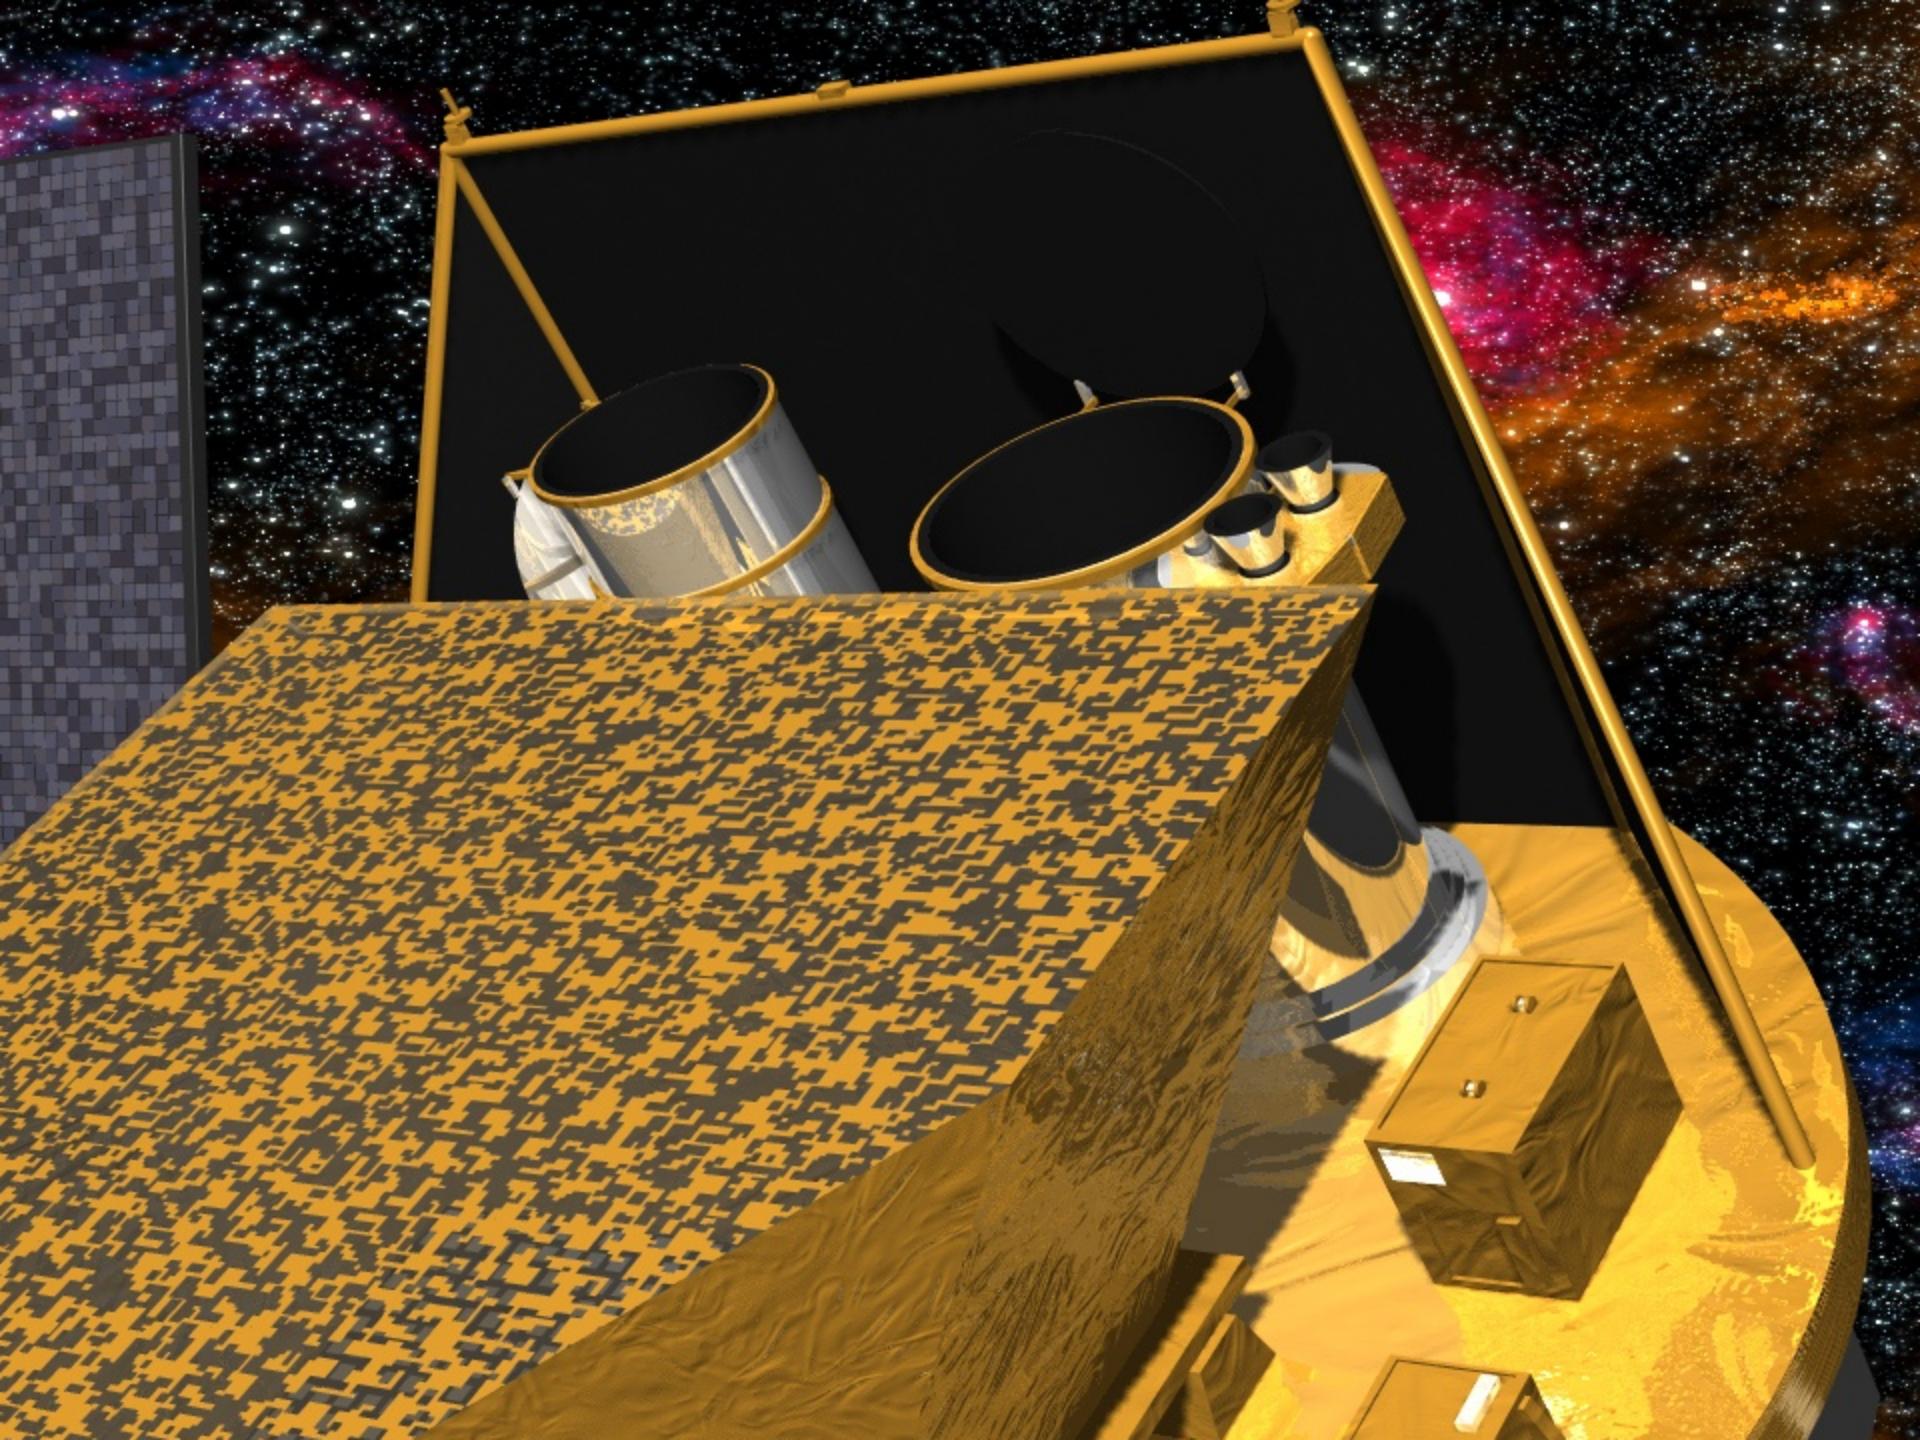

The *difference* in gravity at one side of objects compared to the other side tears everything apart, making huge explosions.

# Another reservoir of energy: neutron star pairs

Spins 30 per sec,  
400,000 mass of  
Earth

Size of ABQ

$10^{15}$  Gauss  
Mag field

ABQ

A volume equal to a poppy seed  
contains a year's supply of energy  
for the USA

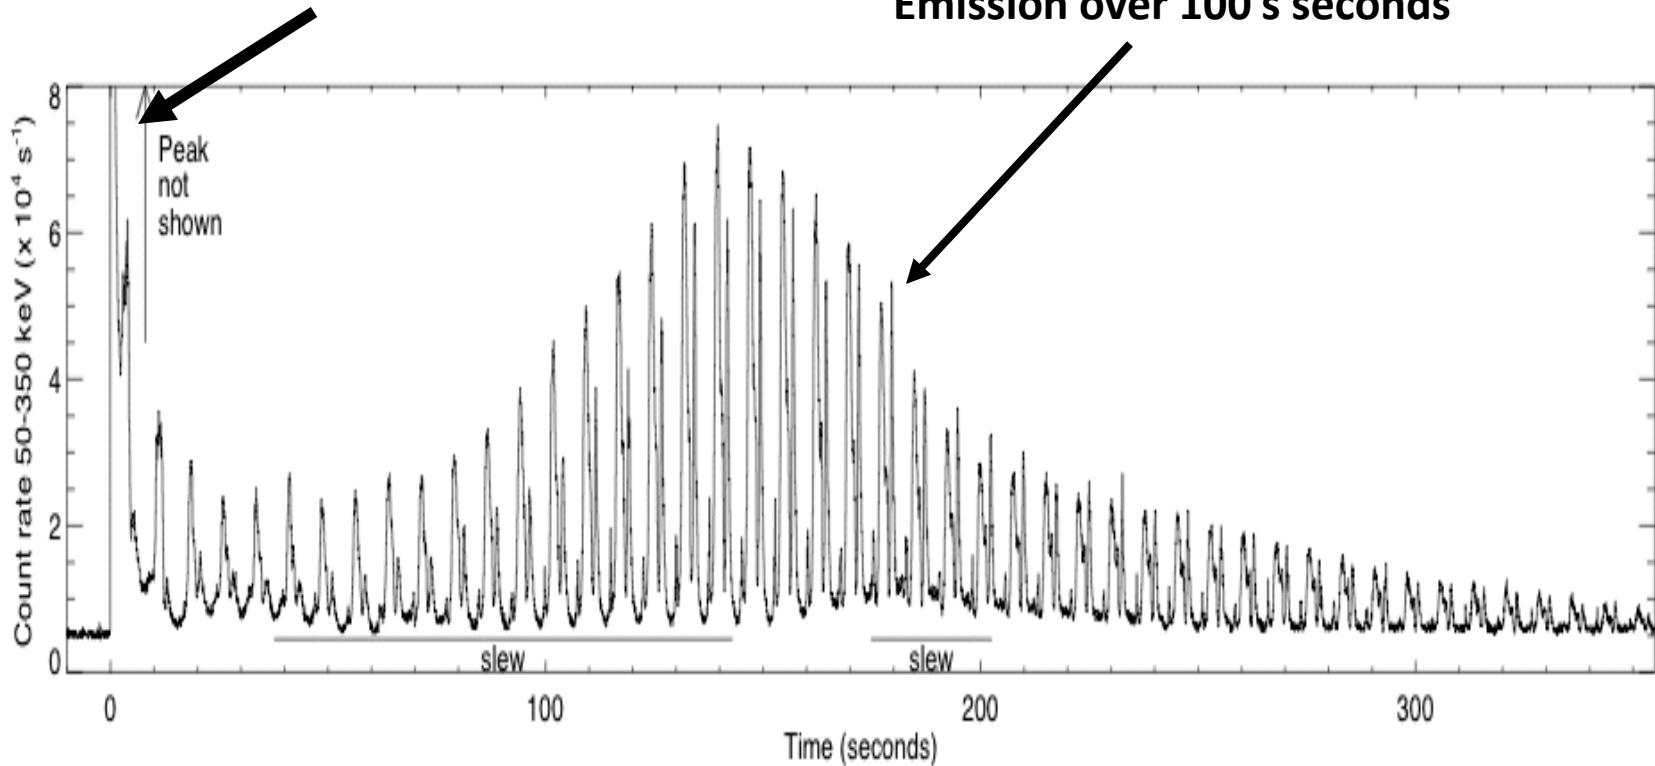

1 cubic inch of the vacuum has a  
mass equivalence of 16,000 tons  
(by  $E = Mc^2$ )

# Dec 27, 2004: a super burst from a “soft gamma-repeater”

Hit the earth with  $5 \text{ erg/sec/cm}^2$  = dime hitting every square inch at 2 inches per sec

Huge peak, 0.16 sec long

Emission over 100's seconds

## Summary

**Gamma-ray bursts were the first indication that the universe contains violent explosions**

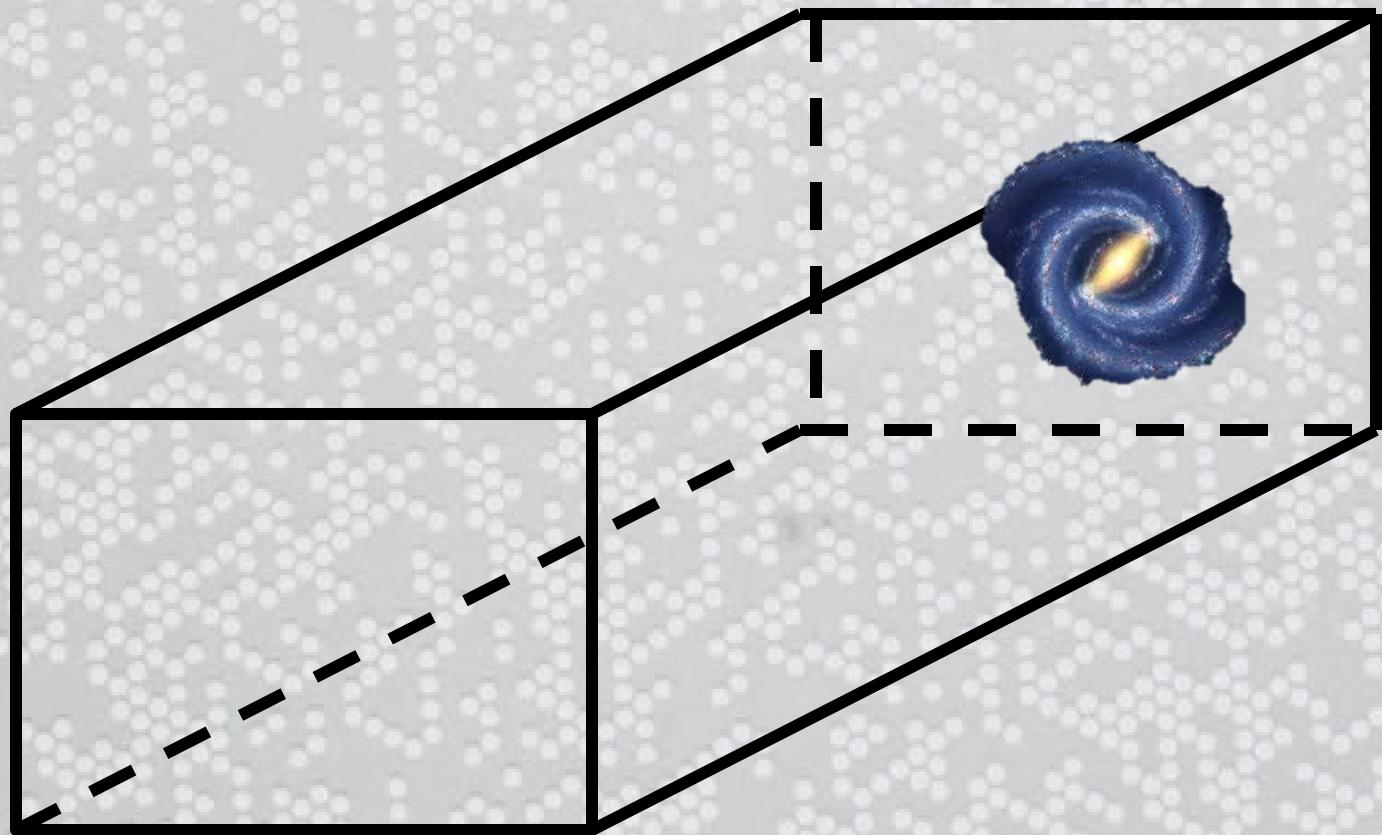

**Multiple pinhole “coded apertures” are well suited to locating bursts of gamma-rays.**

**The location revealed that the bursts were coming from the other side of the universe.**

**Only black holes are powerful enough to be seen so far away**

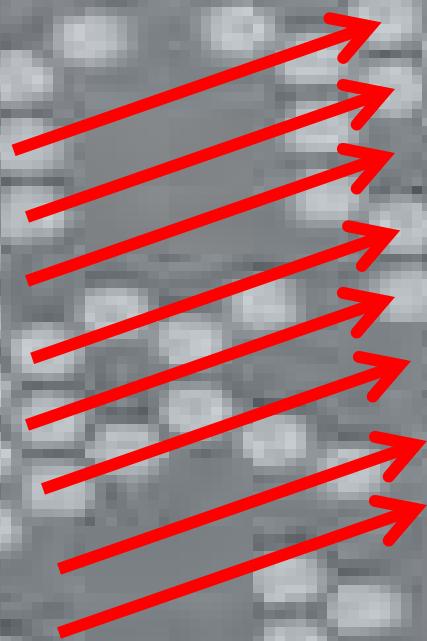

# Backup

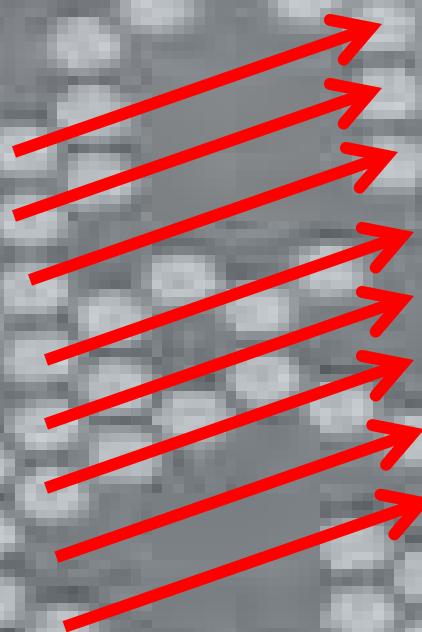

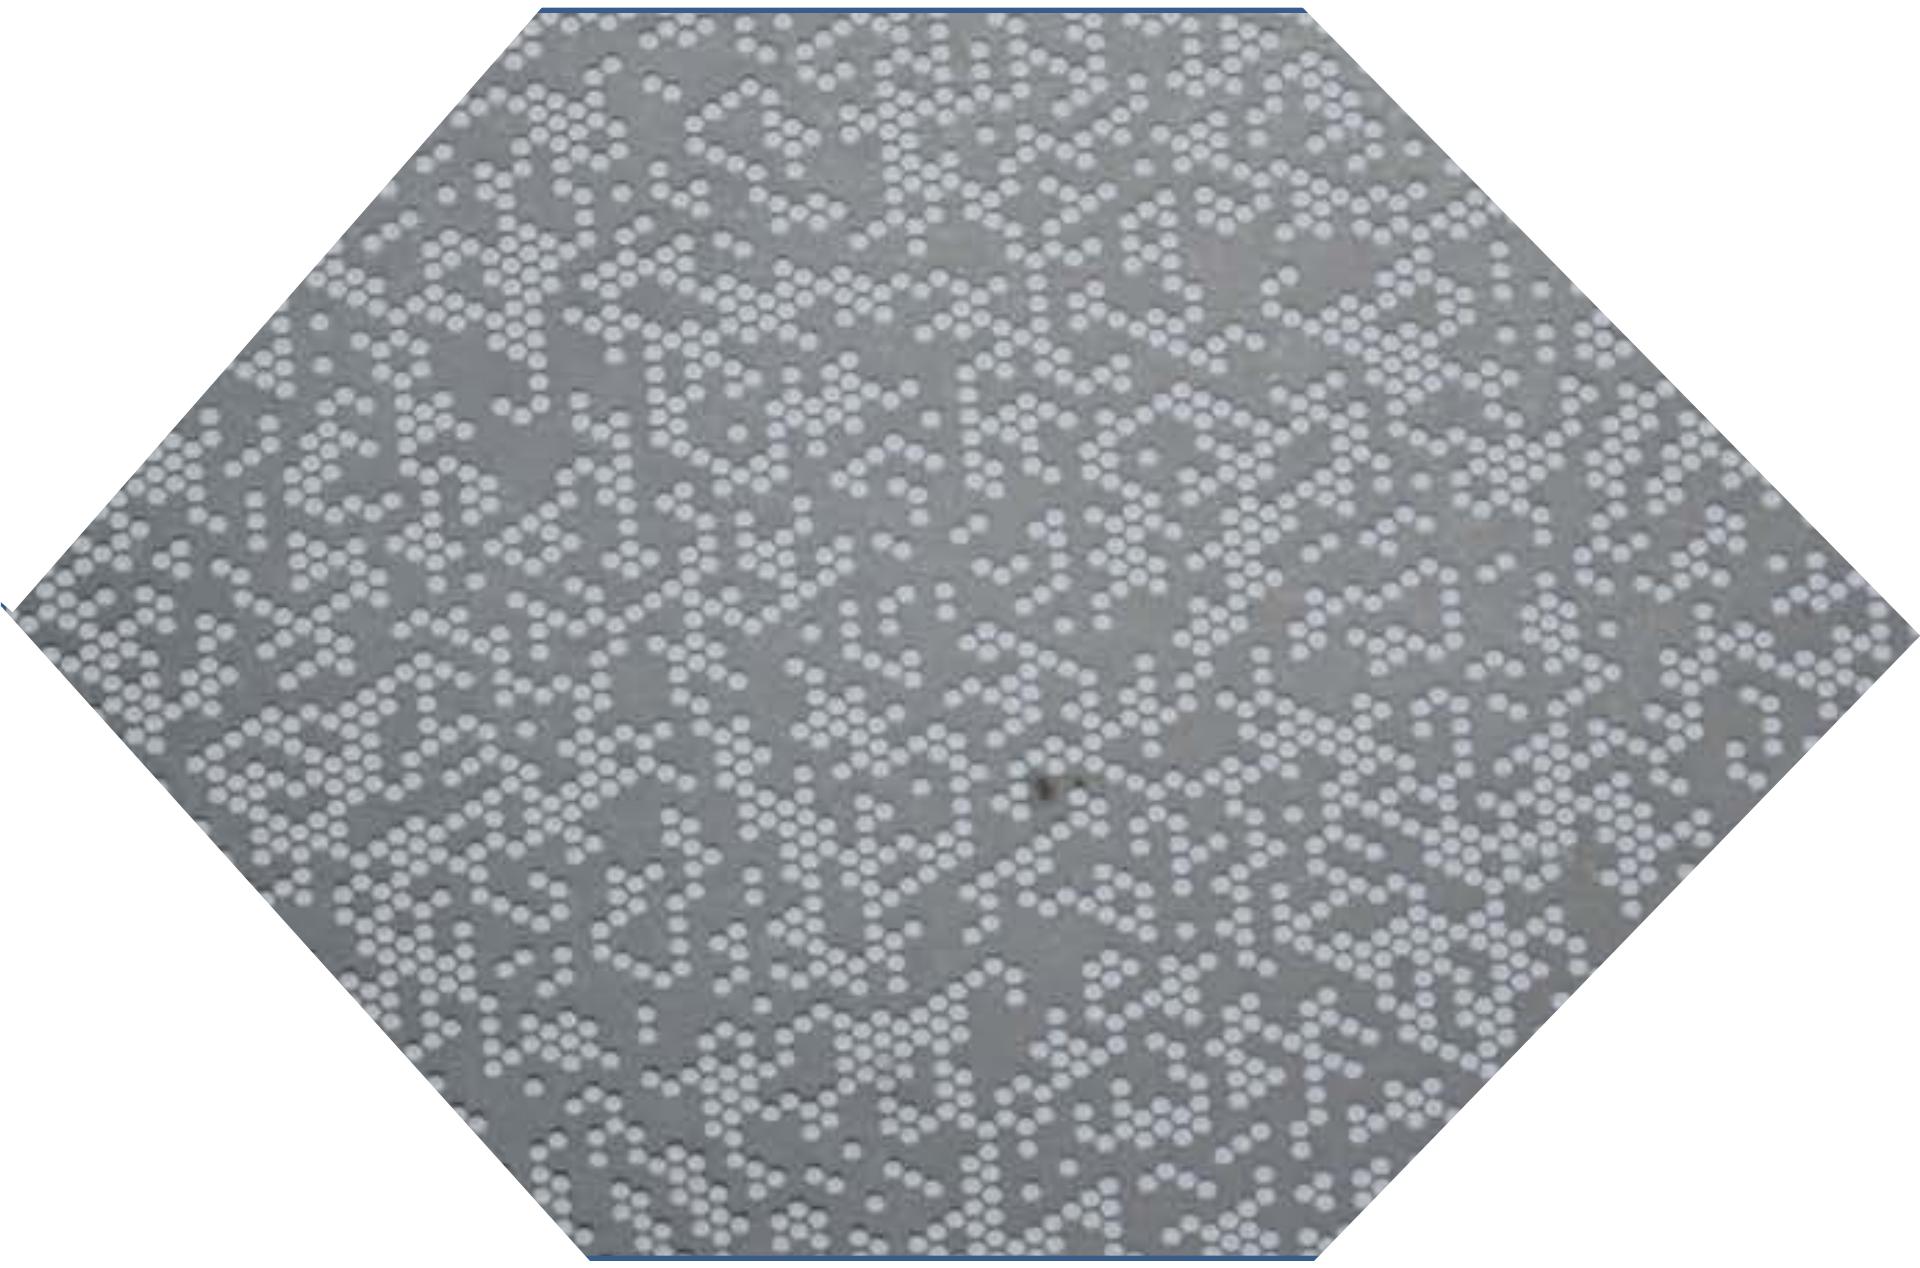

GRBs only last milliseconds to tens of seconds.

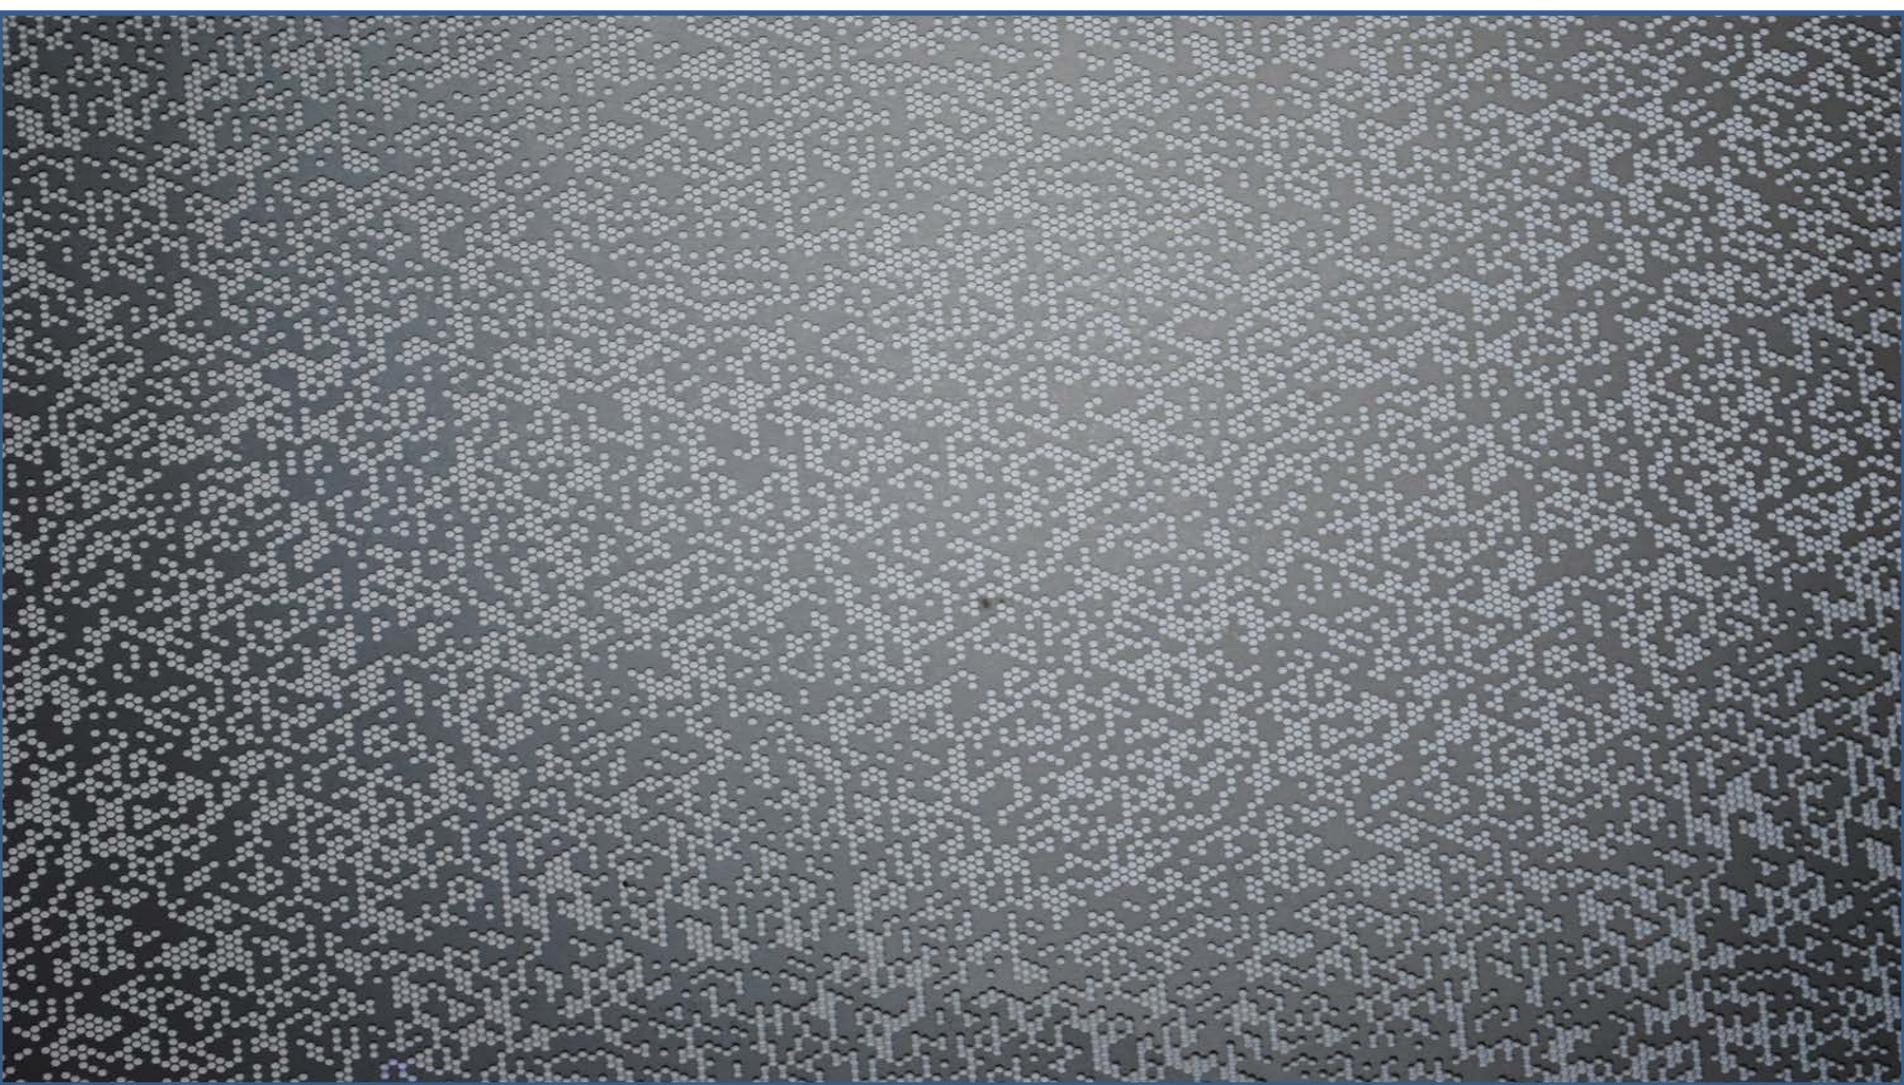

We had to build completely robotic instruments that could detect the gamma-rays and find which galaxy the GRB came from.

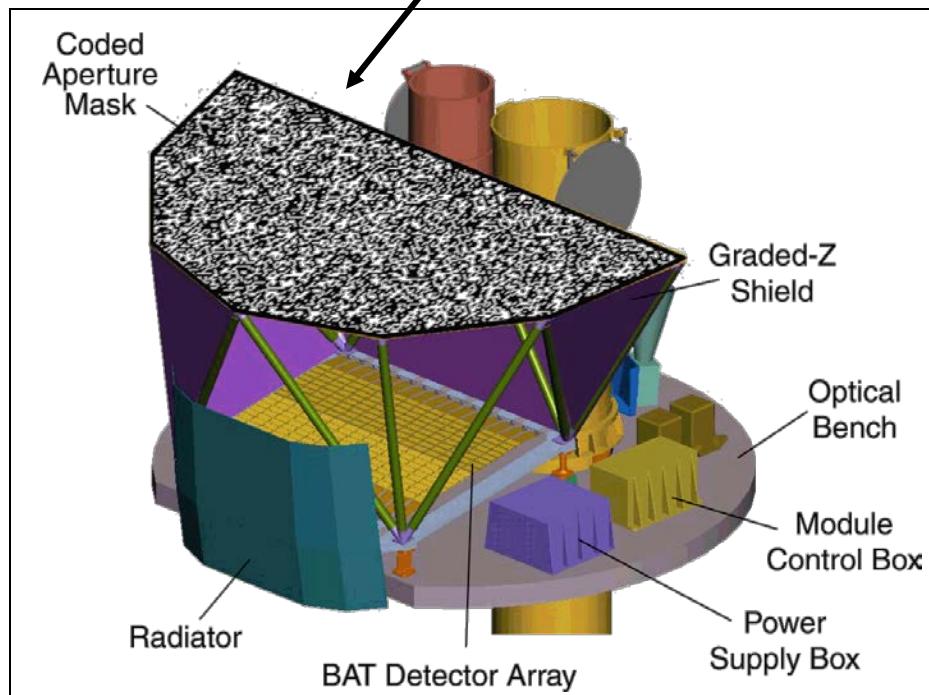

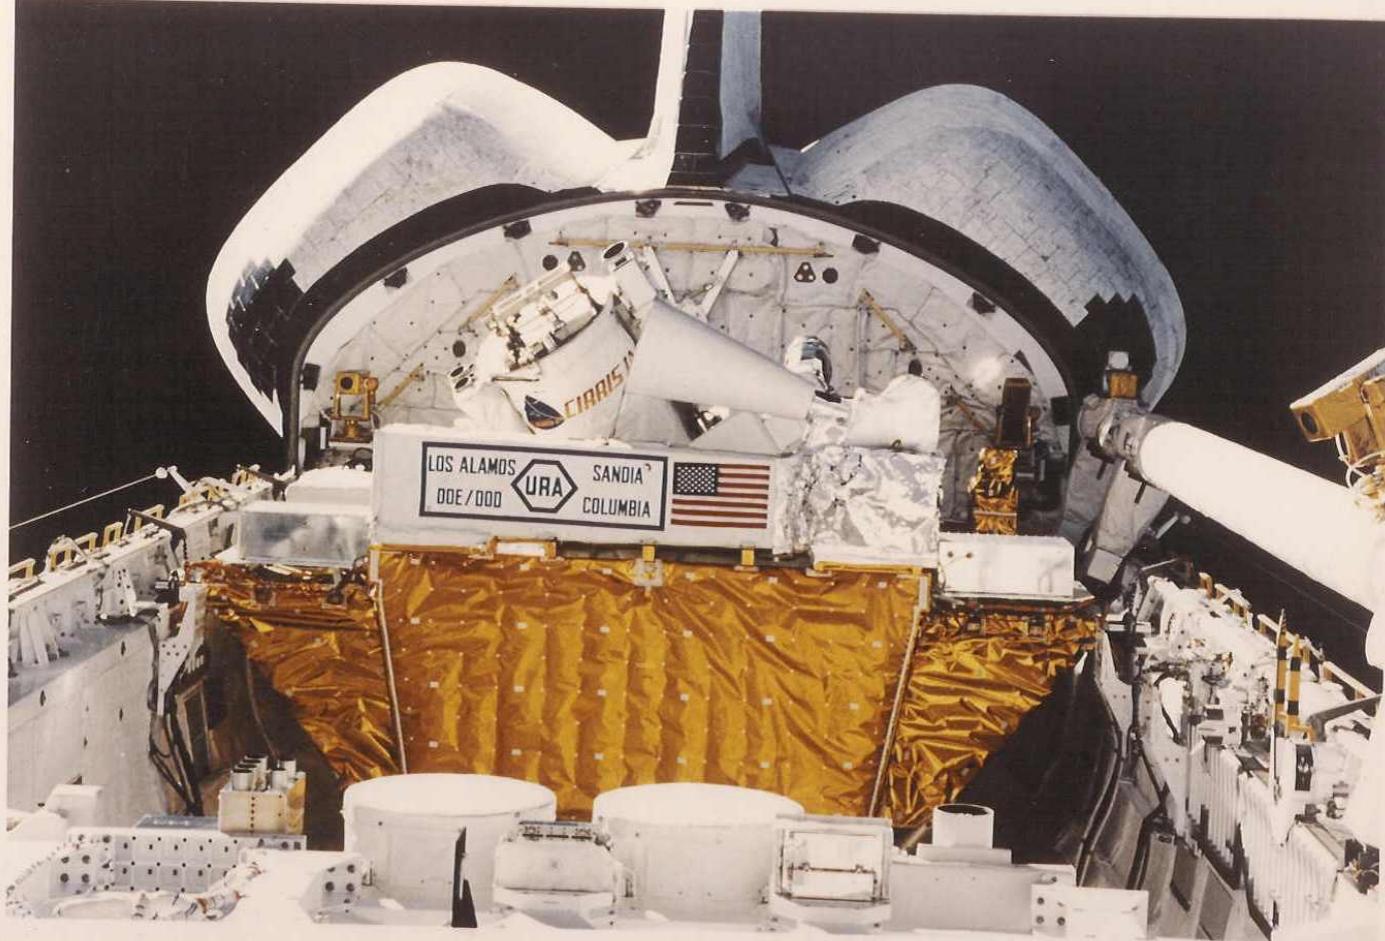

# Burst Alert Telescope (BAT)

## BAT Characteristics

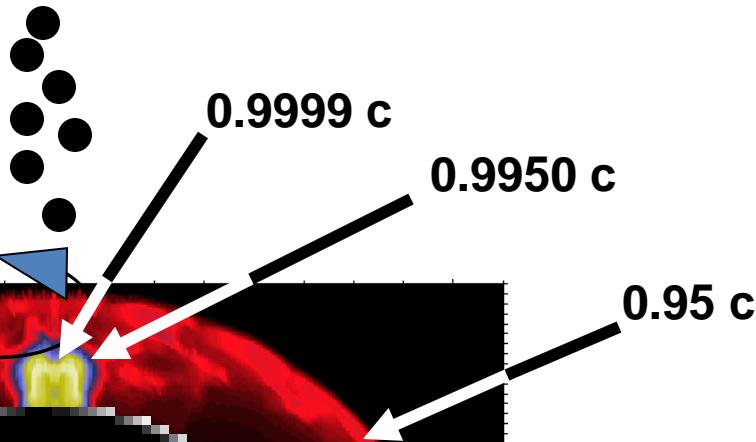

- E Range: 15 - 350 keV
- E Resoln: 7 kev
- Loc Resoln: 1-4 arcmin
- 2 steradian field of view
- 32K CZT dets, 5200 cm<sup>2</sup>
- First satellite to autonomously detect new event and slew satellite to observe
