

Transient Electromagnetic Analysis of Blanket Modules 14 and 15 in Different Sectors of the ITER Blanket System due to Plasma Disruption

J. D. Kotulski and R. S. Coats

jdkotul@sandia.gov

Nov. 2014

Sandia National Laboratories is a multi program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000. SAND2011-0439P

Background

- **The plasma current in the ITER device may experience disruption due to the introduction of impurities or loss of control of the plasma.**
- **These disruption events induce eddy currents within the blanket system which result in large electromagnetic loads.**

Overview

- **This analysis reveals the modeling procedure used to predict the electromagnetic loads on the blanket modules(BM) due to plasma disruption.**
 - **Focus will be on the torque.**
- **Two different configurations of BM's 14 and 15 will be considered.**

Overview(Cont'd)

- **Blanket Modules 14 and 15**
 - In two different sectors of the machine
- **Plasma Disruption Scenarios**
 - Basic description
 - Modeling procedure
- **Electromagnetic Models**
- **Results**
 - Electromagnetic loads
- **Conclusions**

ITER Device

20 degree sector

Plasma Disruption

- **A 15 MA plasma current is flowing in the device, toroidal direction.**
- **Plasma drifts then disrupted.**
 - Due to impurities
 - Loss of stability
- **Plasma current starts to decrease.**
 - Centroid of this plasma moves - eddy currents are induced.

Plasma Disruption Modeling

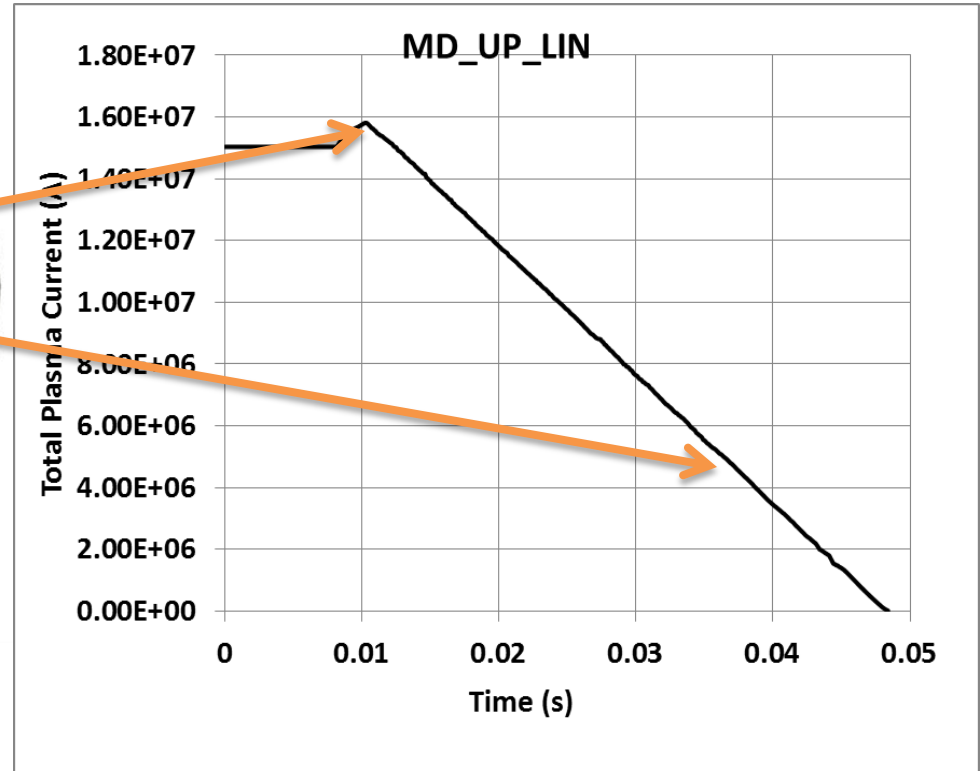

for Eddy Currents

- **From DINA Simulations**
 - Prescribed by the International Organization
 - 20 different scenarios
 - MD – Major Disruption
 - VDE – Vertical Displacement Event
 - Plasma direction down(DW) or up (UP)
 - Plasma current decay linear (LIN) or exponential (EXP)
 - » MD_UP_LIN - Major disruption, upward moving, linear current decay
- **Key Features**
 - Axisymmetric (2-D) description
 - Plasma current modeled by a finite number of filaments
 - Number of filaments vary with time
 - Position vary with time

Plasma Disruption Modeling

DINA Filaments

Total plasma current

NOTE: Points shown are the Dina filament currents

Plasma Disruption Modeling

- **Modeled by 64 stationary solenoids.**
 - Using the equivalence principle.
- **Each has a different time history.**
- **Models the time variation of the total current behavior.**
- **Models the movement of the plasma with time.**

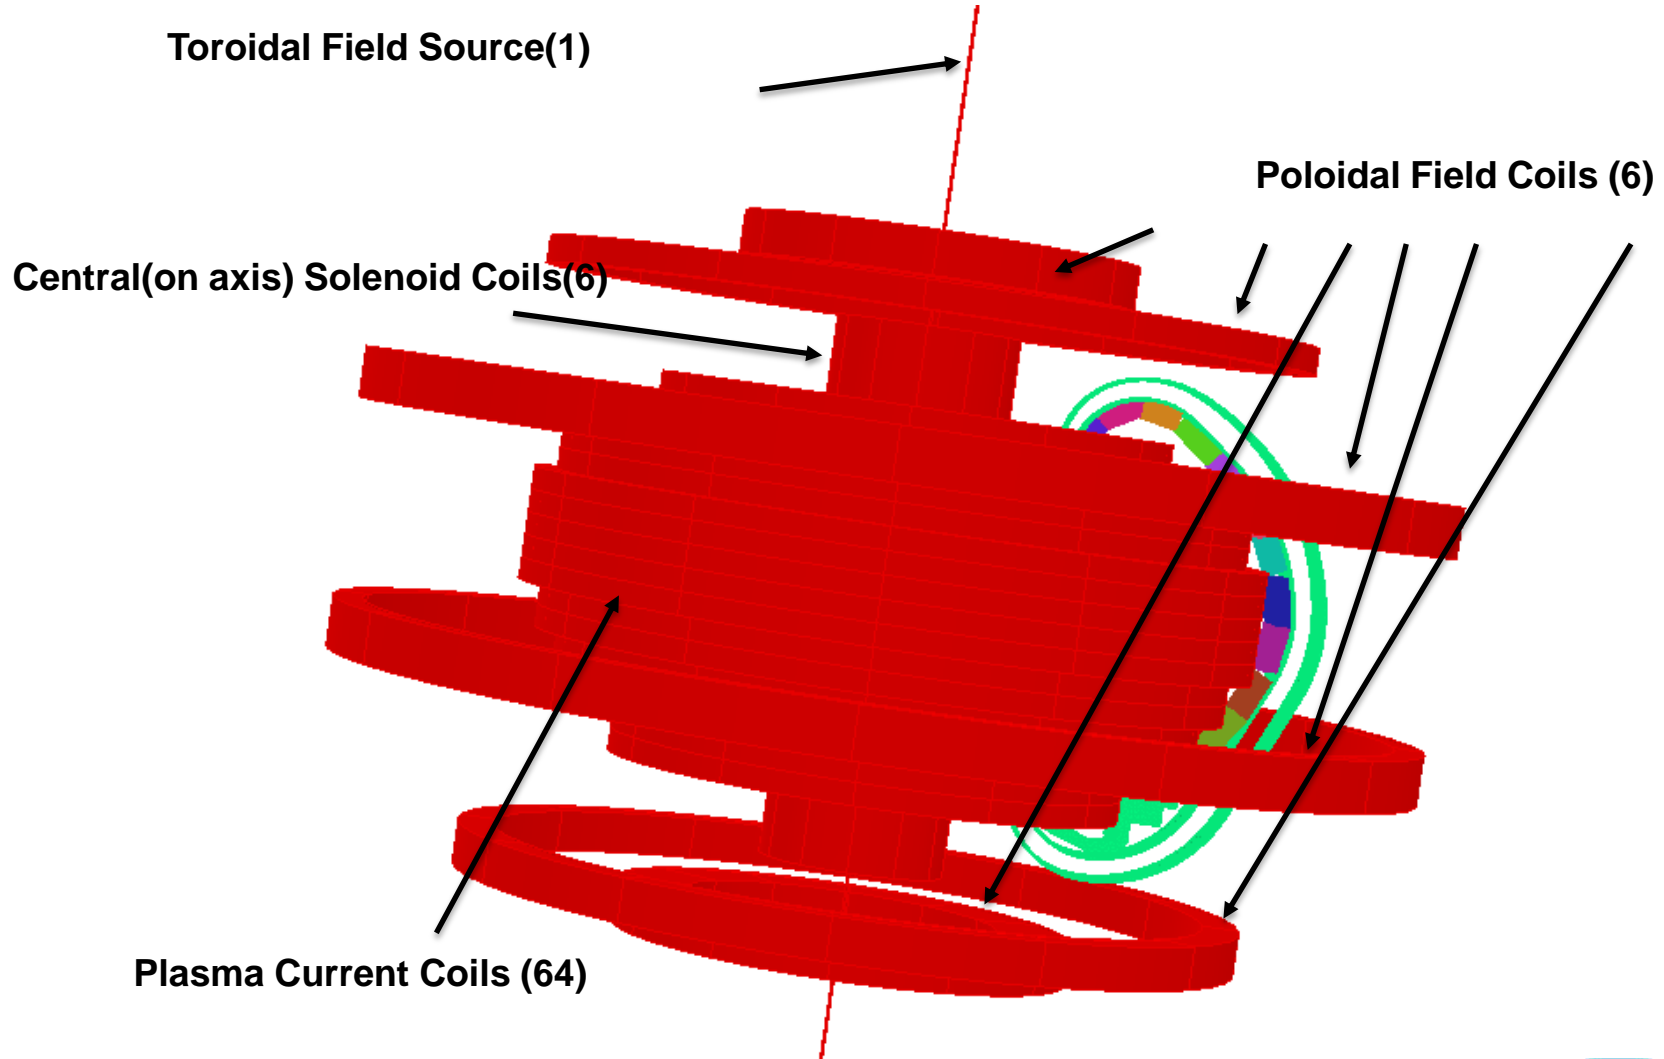

Plasma Disruption Modeling

Machine Outline

Plasma Conductors 64

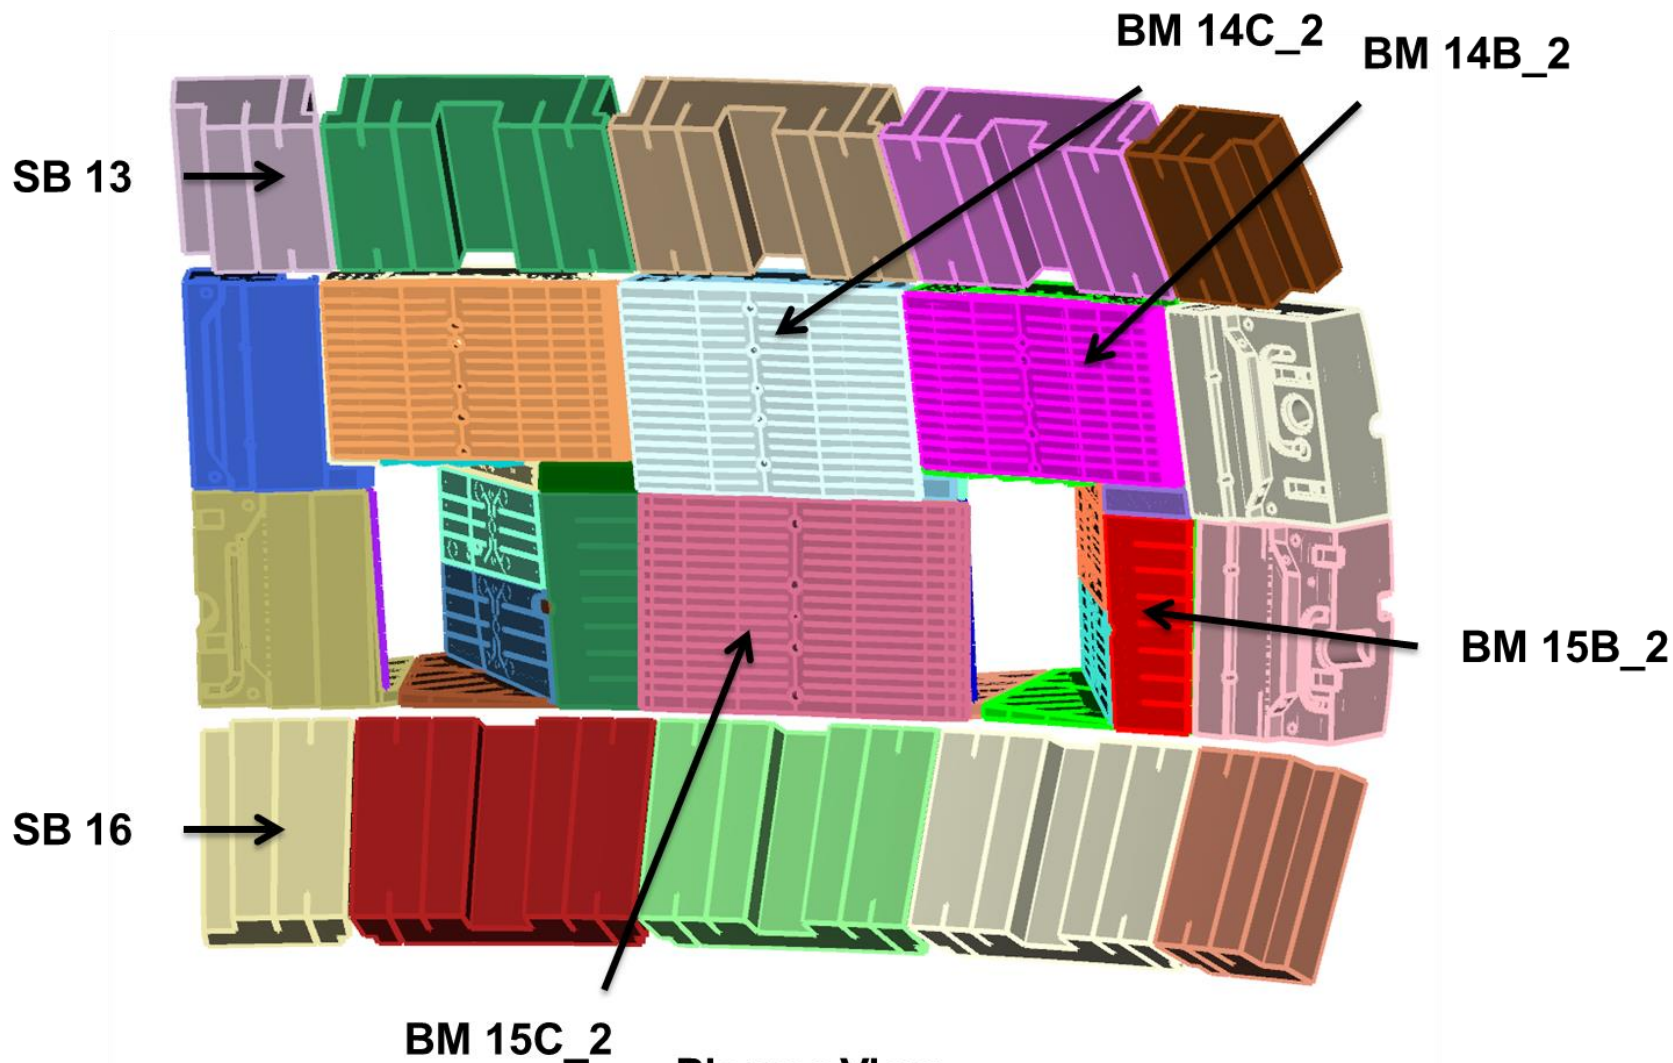

Electromagnetic Model of Plasma Currents

- **For accurate results for a blanket module:**
 - Nearest neighbors are included.
- **Inner and outer vacuum vessels are included.**
- **Simulations performed with Opera-3d software.**
 - **Finite element model**
 - 40 degree sector ~35 million elements
 - 20 degree sector ~19 million elements

Solid Model for NBI Region

Model #1

Inner / Outer Vacuum Vessel
Not shown

40 degree sector

BM 14B_2

BM 14C_2

BM 15B_2

BM 15C_2

- **Calculated forces and torques transformed from the problem to the local coordinate system of a blanket module.**
 - **Radial direction : toward plasma**
 - **Toroidal direction : in direction of plasma flow**
 - **Poloidal direction : $t \times r$**

Pivot Point Description

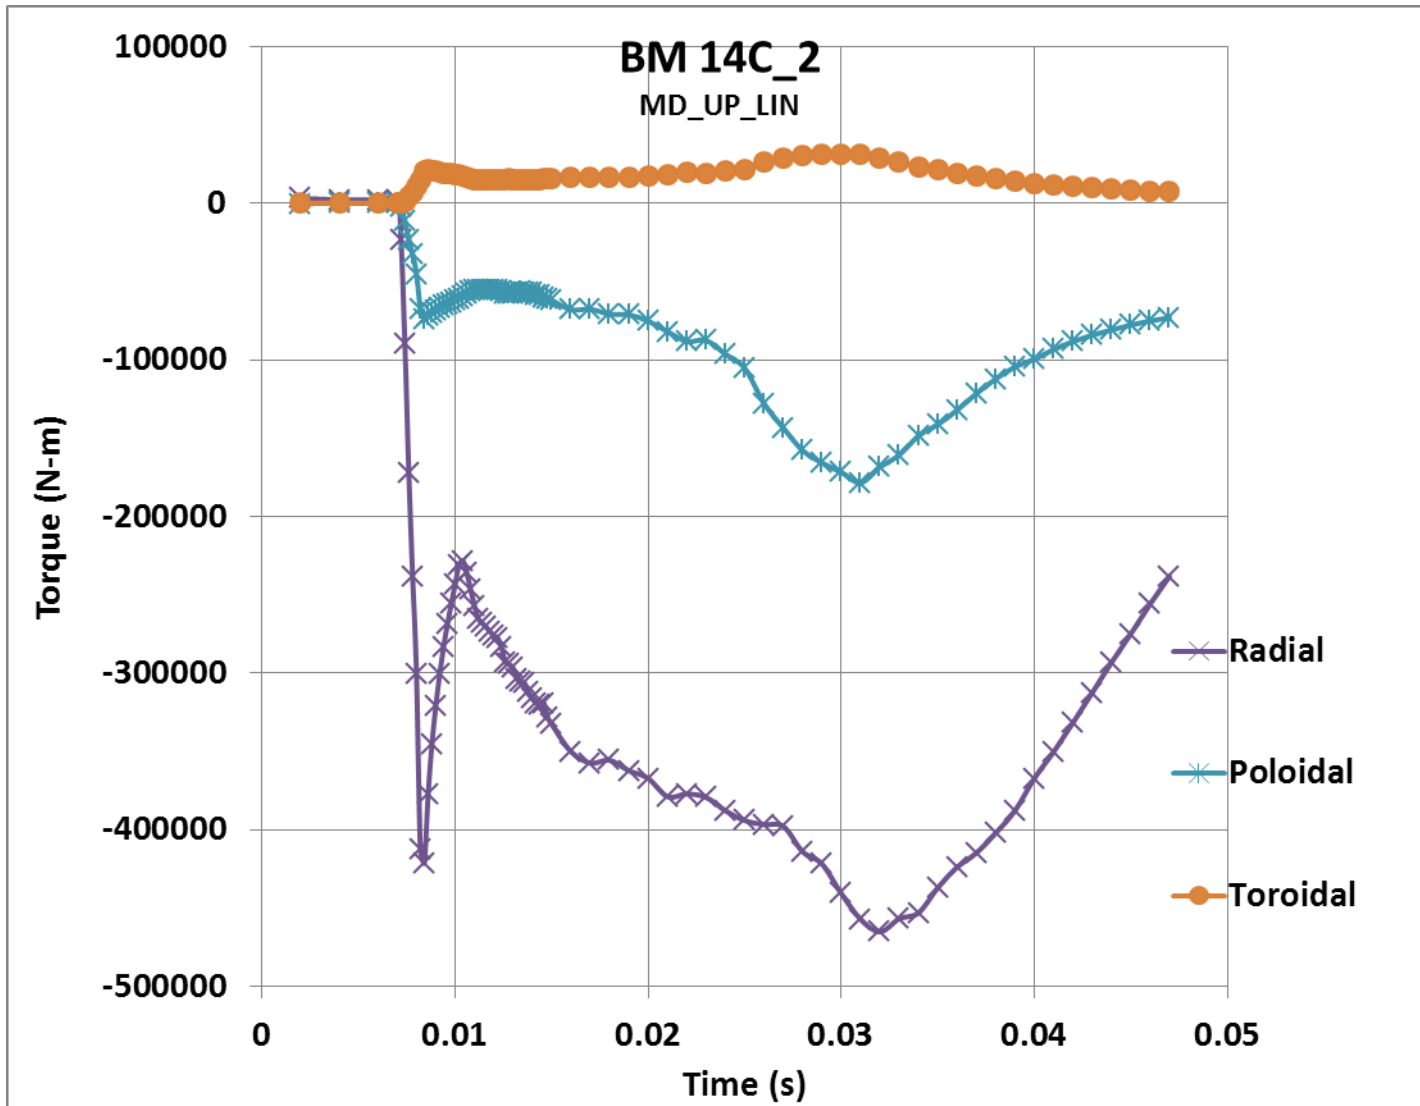

- Pivot point calculated using flexible mount centroids.

Load Comparisons

Conclusions(1)

- **The analysis technique used to predict the electromagnetic loads on selected outboard blanket modules has been described.**
 - Plasma disruption modeling
 - BM models
- **The torques have been calculated for different plasma disruption events for these modules.**
 - Forces calculated but not shown.

Conclusions(2)

- **The force distribution within the components of each blanket module is available.**
 - For stress calculations
- **Since each blanket module component has been separated electromagnetic loads have been calculated:**
 - First wall to shield block
 - Plate attachments
