Instructions

Los Alamos National Laboratory _ Subcontract No. 250954
ADESH
Lab Request # N/A
SDG is 576893.

28-day TAT, PRELIMINARY.
ALL DATA IS DUE TO THE CLIENT ON 07/24/2015.

4 overall samples (4 container) were received on 06/26/2015, which is listed on this Task Order.
Thermal property measurements of SWheat, nitrate salt and water mixtures.

MIXTURE
The nitrate salt mixture consist of magnesium nitrate, calcium nitrate and sodium nitrate. These are provided separately and will be mixed by SWRI in the following weight ratios: 63.4% magnesium nitrate, 22.5% calcium nitrate and 14.1% sodium nitrate.

The Swheat salt mixture will be mixed by volume with the above nitrate salt mixture. Two ratios will be used 3:1 Swheat to salt and 1:1 Swheat to salt. The 1:1 mixture will be tested dry, while the 3:1 mixture will have three different water contents-dry, 6.25% by mass water and 50% by mass water. All ratios will be well mixed, such that the water and salt is well distributed

All the 3:1 mixtures will have the thermal conductivity, density and heat capacity measured, while the 1:1 mixture will have the thermal conductivity
and density measured. The tests will be performed at three temperatures, -10 ?C, 20 ?C and 40 ?C.

THERMAL PROPERTIES OF SWHEAT AND NITRATE SALT MIXTURES

Three nitrate chemicals and a bag of Swheat were received on 06/26/2015 and logged into SwRI's Laboratory Information Management System (LIMS). The purpose of this project was to measure the thermal properties Swheat, nitrate salt, and water mixtures. The nitrate salt mixture consisted of magnesium nitrate, calcium nitrate and sodium nitrate. Two ratios were used: 3:1 Swheat to salt and 1:1 Swheat to salt. The 1:1 mixture was tested dry, while the 3:1 mixture was tested at three different water contents: dry, 6.25% by mass water, and 50% by mass water. Table 1 & 2 contains the LIMS and sample information, and Table 3 contains the test matrix.

Mixture Preparation

The nitrate salt mixture was prepared by mixing 63.4% magnesium nitrate, 22.5% calcium nitrate and 14.1% sodium nitrate. The 1:1 and 3:1 Swheat to nitrate salt mixtures were combined by volume. Using the 3:1 Swheat to nitrate salt mixture, two additional samples were prepared having a moisture content of 6.25% and 50% by weight by adding the water and mixing well to insure an even distribution.

Density

Density was determined using ASTM D5057 *Standard Test Method for Screening Apparent Specific Gravity and Bulk Density of Waste* at the three test temperature. The known weight of sample was placed in a 500 mL test container and brought to the desired temperature. The volume of sample at the test temperature was determined and the density calculated.

Thermal Conductivity

The thermal conductivity of the test mixtures was measured using the transient heat method as described in ASTM D5334 *Standard Test Method for Determination of Thermal Conductivity of Soil and Soft Rock by Thermal Needle Probe Procedure*. The Hukseflux TP02 Non-Steady-State Probe (NSSP) for thermal conductivity measurement was used for the analysis. The NSSP consists of a line source, which applies heat, and temperature sensor, which can measure the temperature of the source. By measuring the heater power, and measuring the temperature as a function of time, the thermal conductivity can be calculated. The tests were conducted at temperatures as near to the test temperatures as possible. The actual temperature is reported in the final data.

Heat Capacity

The test mixtures were analyzed according to ASTM D 2766 *Standard Test Method for Specific Heat of Liquids and Solids*. The specific heat was determined by measuring the temperature change of water at an initial temperature in an adiabatic calorimeter when a container filled with the test specimen is transferred from a constant temperature zone into the calorimeter. Tests were conducted at several select constant temperatures spread over the temperature range of interest. From the temperature change of the water, the amount of heat gained or lost was calculated. After correcting for the heat transfer due to the empty container, the heat capacity of the sample was determined. The calculated heat capacity versus temperature was plotted and the best fit line applied. Using the equation of the line, the heat capacity at the requested test temperature was calculated.

TA-54 Emissivity Measurements

Total hemispherical emissivity measurements in the range of $3<\lambda<35$ μm were made on surfaces of the Dome 375 Permacon exterior at TA-54 using a method established in ASTM Standard E 408-71 (reapproved 2008) [1]. These measurements were made with an AZ Technology TEMP 2000A portable infrared emissometer and reflectometer [2]. Total hemispherical reflectivity was found using the ASTM standard's "Test Method A" for successive measurements assuming that reflectance of the surfaces are grey (does not change with wavelength). The average of twelve measured reflectivity values for each sample was computed and subtracted from unity to give hemispherical emissivity over the range $3<\lambda<35$ μm:

$$\varepsilon_n = 1 - \frac{1}{N}\sum_{n=1}^{N}\rho_i$$

Although no NIST traceable standard exists for reflectivity measurement in the infrared, NASA has used the ASTM Standard E 408-1 method since the 1960s. AZ Technology is now attempting to establish a reflectivity standard through the National Physics Laboratory in the UK. Before test the portable infrared reflectometer is calibrated with two manufacturer-supplied standards of stable and characterized reflectance. The first standard is blackened with $\rho = 0.079 \pm 3\%$ and the second standard is gold plated with $\rho = 0.980 + 1\%$ and - 3% (all having 95% confidence intervals). Once calibrated, linearity is assumed over this range. The uncertainty interval associated with the upper bound of each reflectivity measurement is estimated by interpolation.

A summary of results for the various surfaces is shown in Table 1. Several surfaces were characterized during test with the following results for total hemispherical emissivity:

1. Reference gold calibration standard (measured emissivity ~ 0.020)
2. Reference black calibration standard (measured emissivity ~ 0.922)
3. Surface of stainless steel side panel of the Permacon (measured emissivity ~ 0.130)
4. Surface of blue painted frame on Permacon (measured emissivity ~ 0.898)
5. Surface of blue door on Permacon (measured emissivity ~ 0.891)
6. Surface of white rolling door of Permacon (measured emissivity ~ 0.85)

Most samples exhibited consistent measured infrared emissivity. The only exception to this consistency was on the irregular white rolling door surface. Convolutions on the door surface (the only suitable surface for measurement) were of similar size to the IR measurement head aperture. Consequently, emissivity measurements on the convolutions were somewhat sensitive to the position of the head on the surface. Two measurements were made: one yielding 0.835 total hemispherical emissivity, the other 0.866. Averaging these measurements gives a total hemispherical emissivity of 0.85. This average value for total hemispherical emissivity is in the typical range for white painted surfaces.
