

Analysis of Gold Coatings for Electrical Contacts

Michael Brumbach, Nicolas Argibay, Josh Sugar

Sandia National Laboratories

Gold coatings are used in electrical contacts to provide highly conductive, inert surface films. Gold reduces electrical contact resistance, reduces friction in sliding contacts, and allows for wire-bonding in microelectronics. A variety of analyses on gold contacts will be discussed including fundamental work on characterizing diffusion, methods for characterizing gold film properties, and analysis of wire-bond pads.

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.
