Experimental investigation of the breakup of a round liquid jet in a shock-induced crossflow

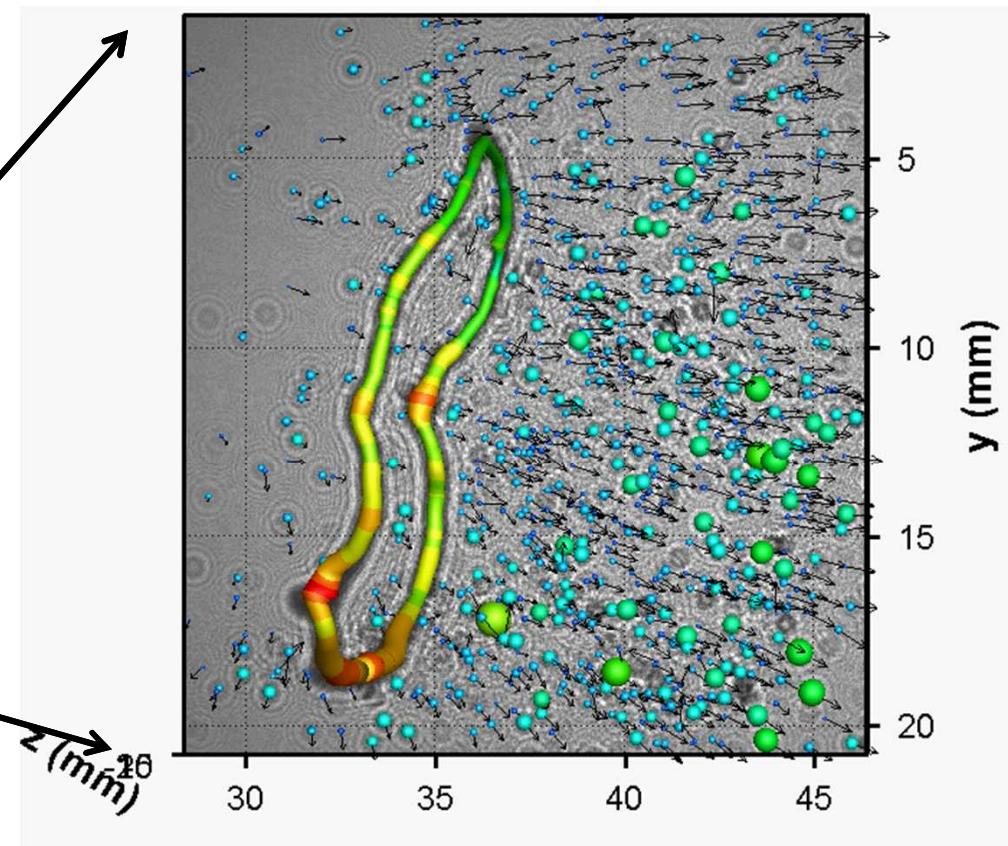

Authors: JOSEPH OLLES,
DANIEL GULDENBECHER, JUSTIN WAGNER, EDWARD DEMAURO,
PAUL FARIAS, THOMAS GRASSER - Sandia National Laboratories
PAUL SOJKA - Purdue University

Motivation

- Large effort in modeling of liquid breakup
 - Shocked jet is easier to produce vs. drops
- Reproducible experiment with well defined conditions
- Liquid subjected to crossflow with diagnostics to increase resolution
- Validation experiments with advanced diagnostics
- Instabilities

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

Experimental setup

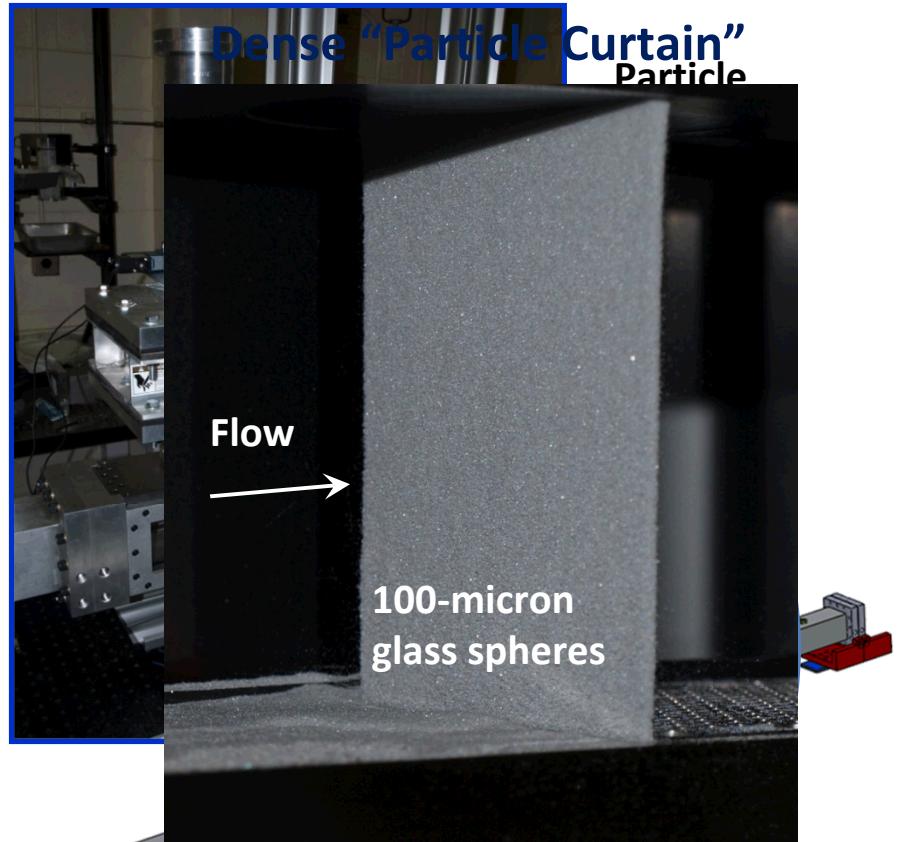

- Liquid jet – pressure vessel driven
- Shock tube – velocity measured with PIV
- Imaging/holography
- Parameter space – backlit @ 40k fps, length of visualization (3+inches), FoV (measure from image), burst disk pressures (velocity)
- R-T instability – planar result, cylindrical measured results
- Holograms – 100k fps, particle tracking, velocities

Shock tube characterization

Multiphase shock tube facility

- Allows study of shock-particle interactions in dense gas-solid flows.
- Shock Mach #s up to about 2, driven section at atmosphere
- 76 mm × 76 mm test section

Particle volume fraction $\approx 20\%$

Laboratories

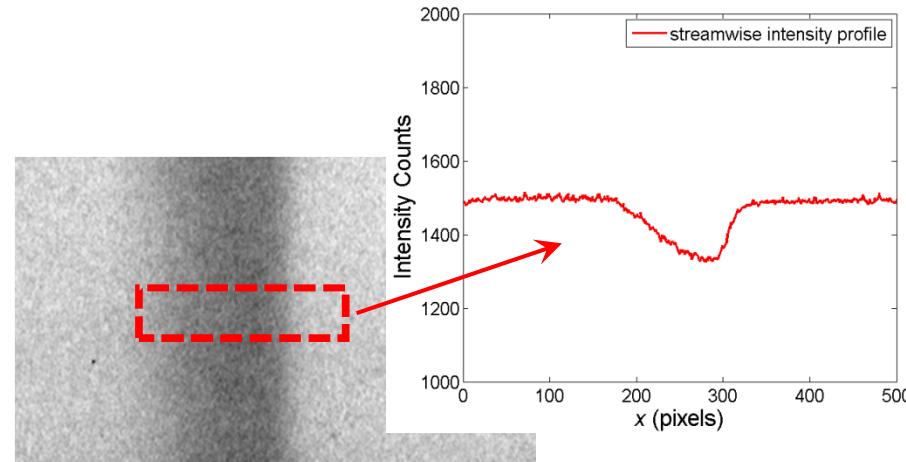

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

Shock tube characterization

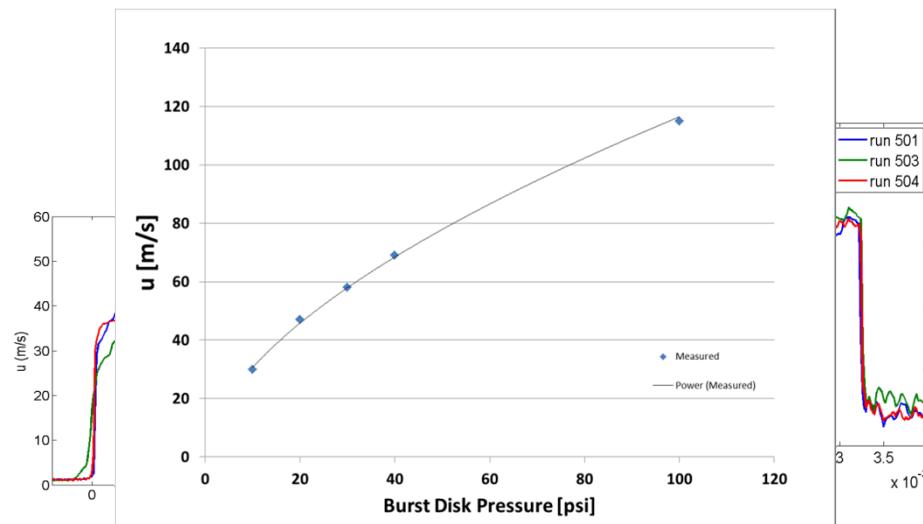

Interaction at shock
Mach number = 1.67

Interaction Radiographs (Flash X-Ray)

Extract Convective Flow Velocities

High speed backlit images

$t = 1.15$ ms

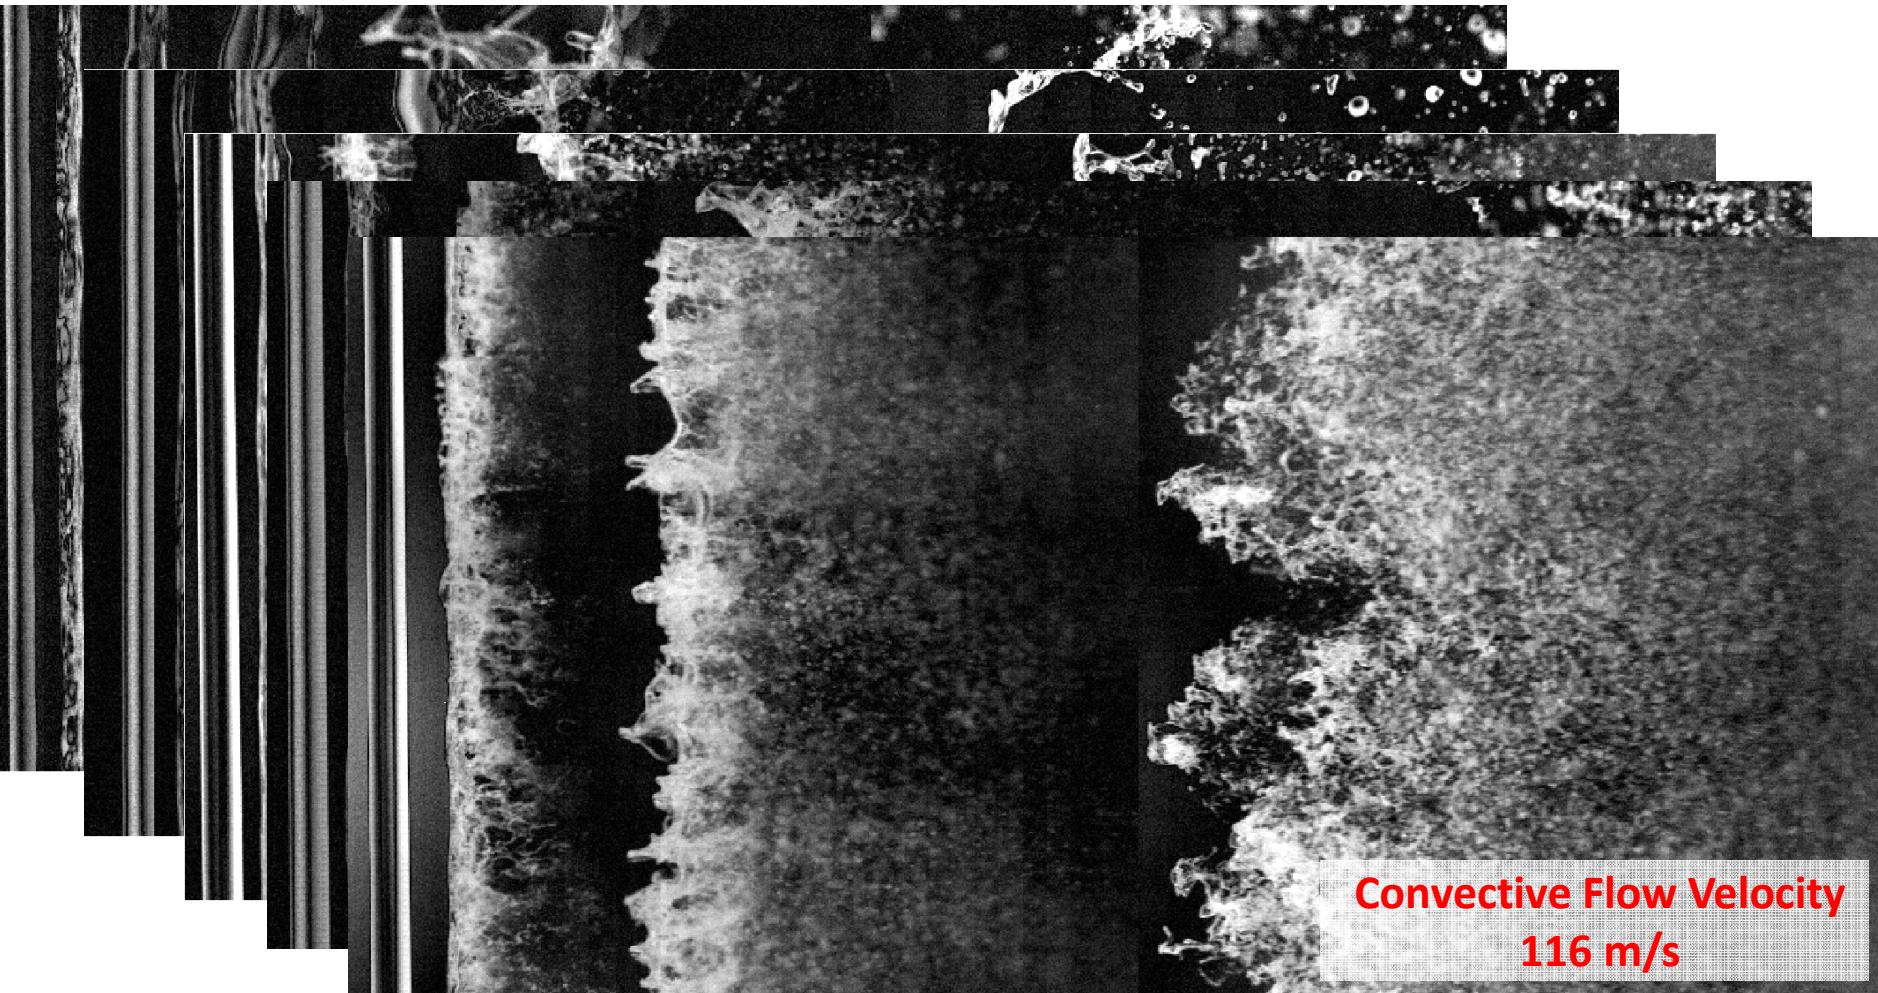

round water jet

shock propagation direction

5 mm

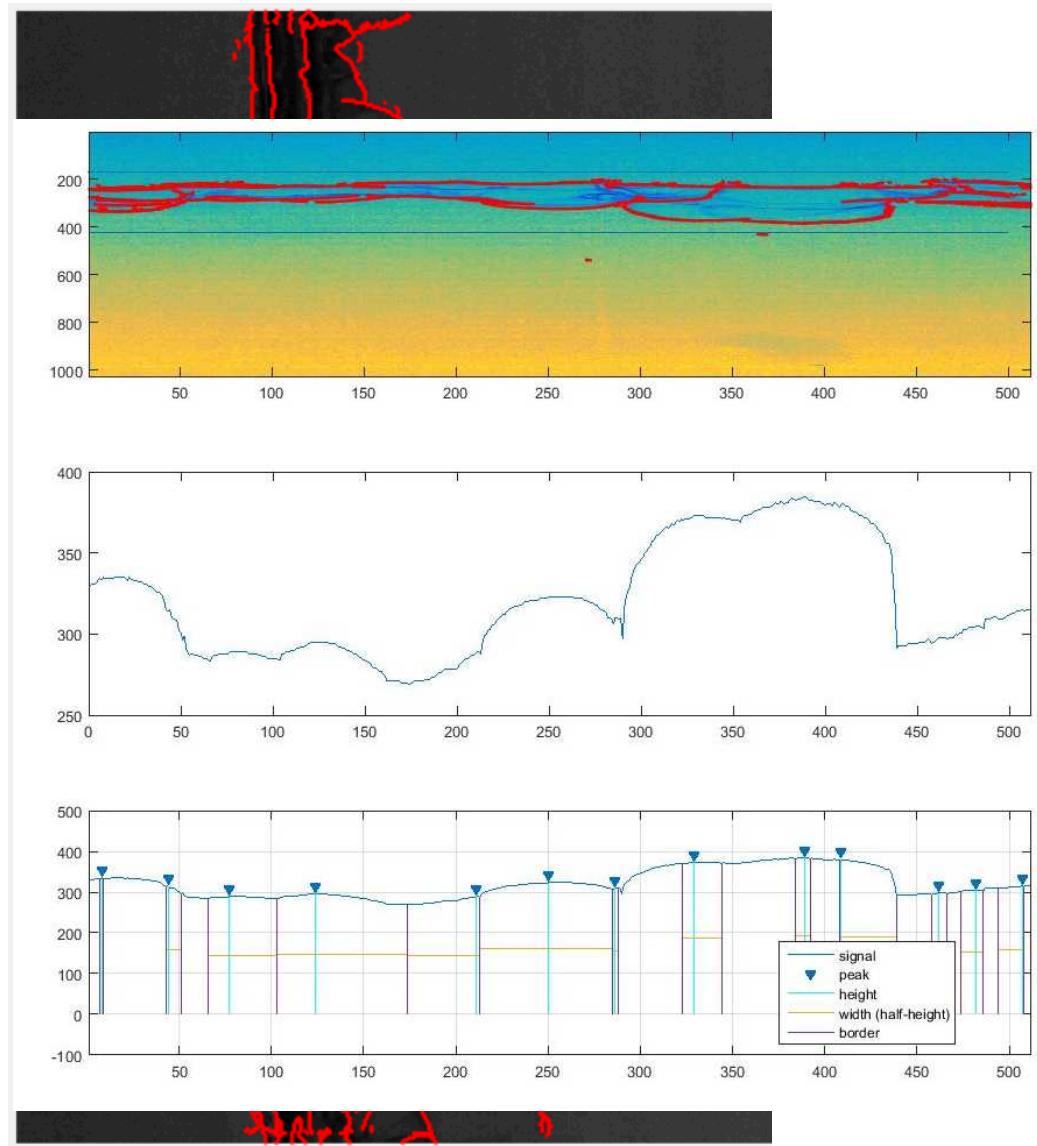

High speed backlit images

- Progression of jet, varying input velocity

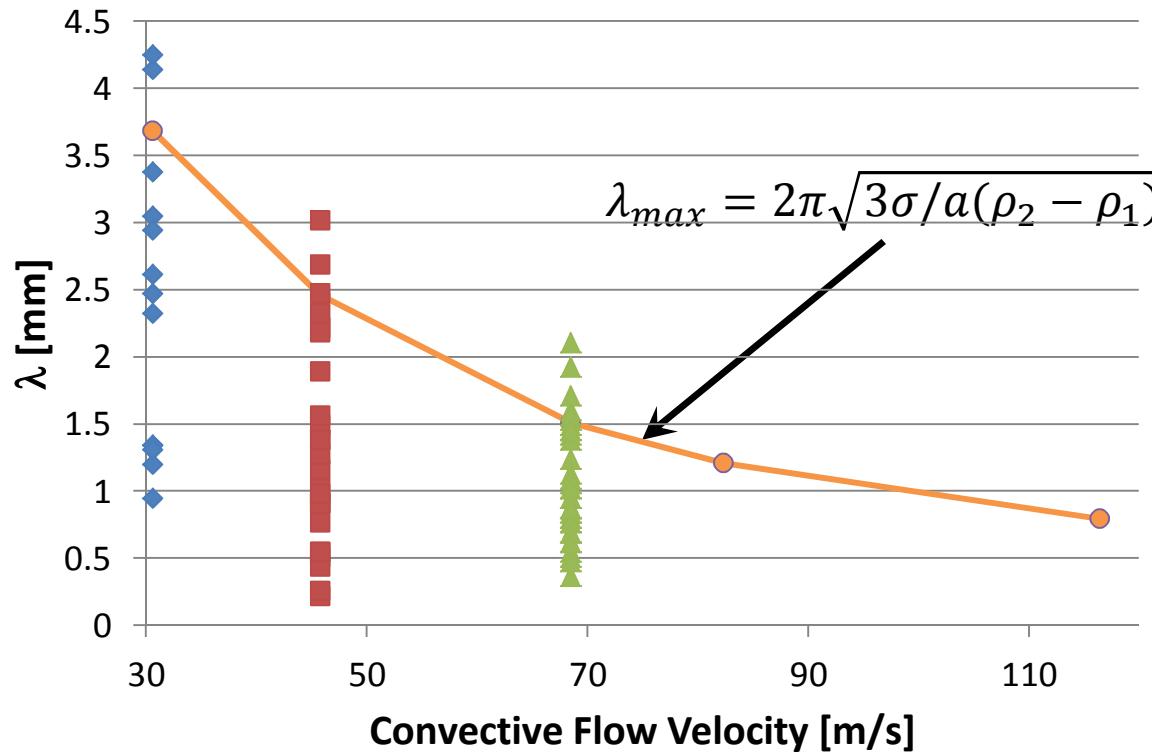

Rayleigh-Taylor Instability

- Taking node spacing as the bag/ligament point
 - MATLAB image processing along with findpeaks

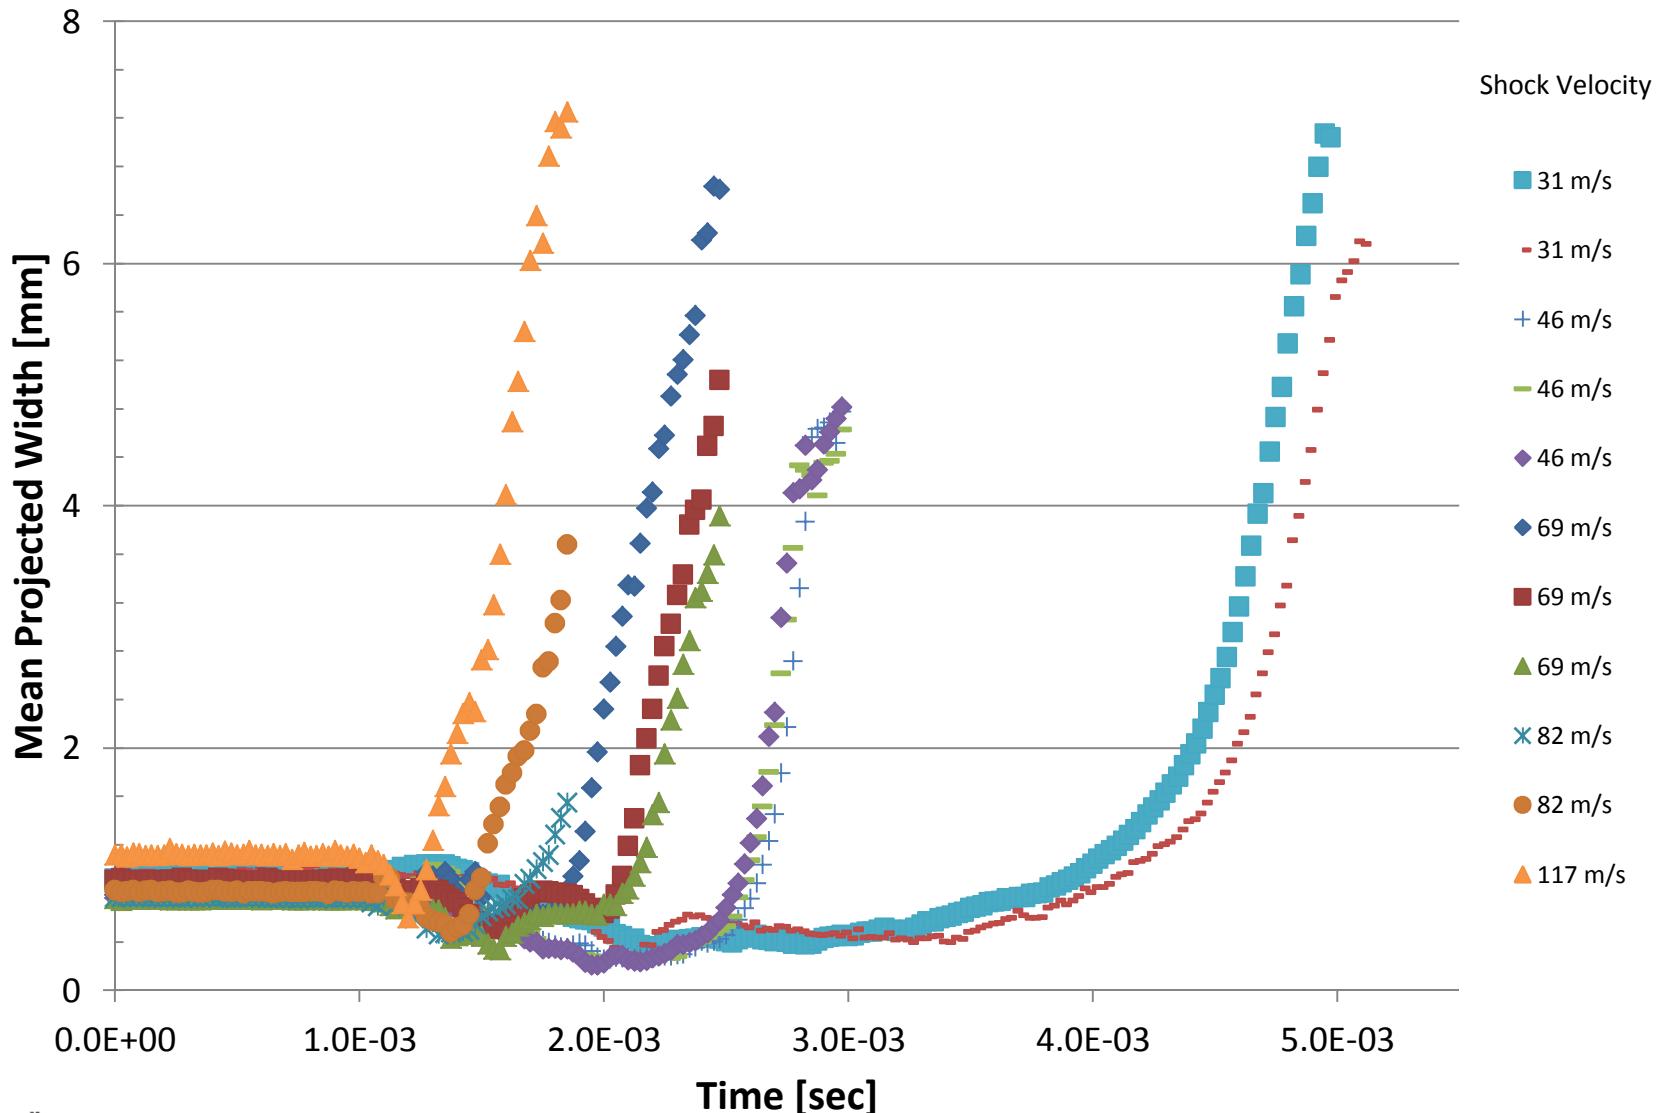

Rayleigh-Taylor Instability

- λ_{max} from planar instability theory
 - Higher velocities breakup too quickly to analyze

Column Growth in Time

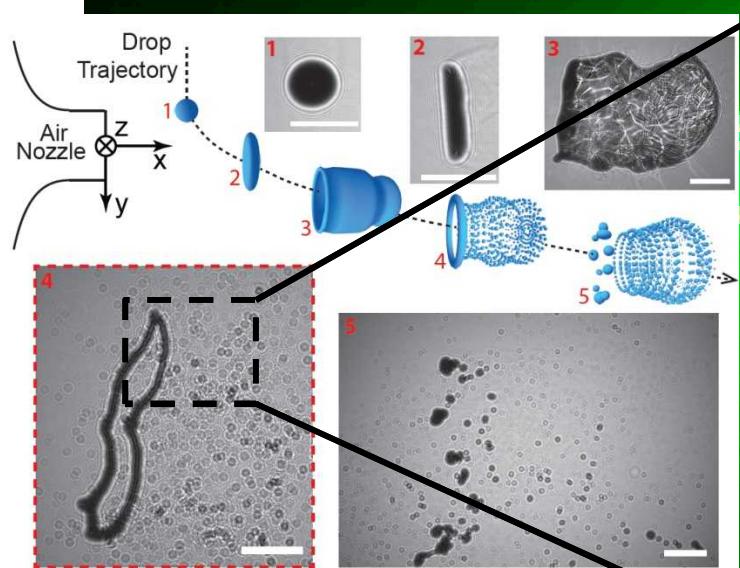

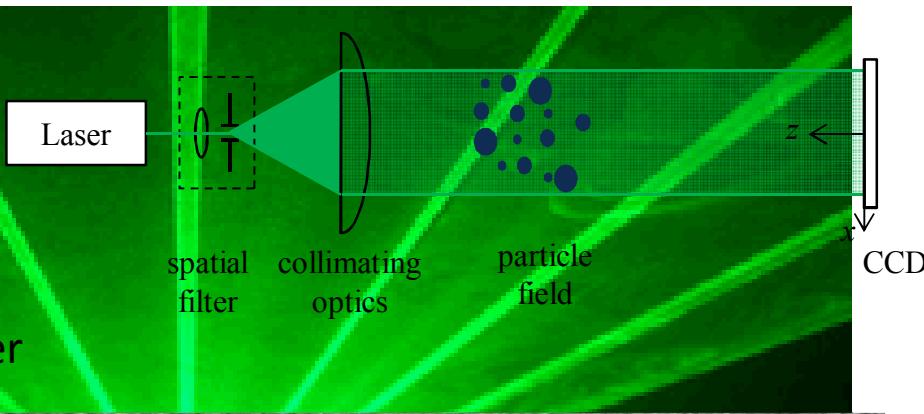

What is holography?

Digital In-line Holography

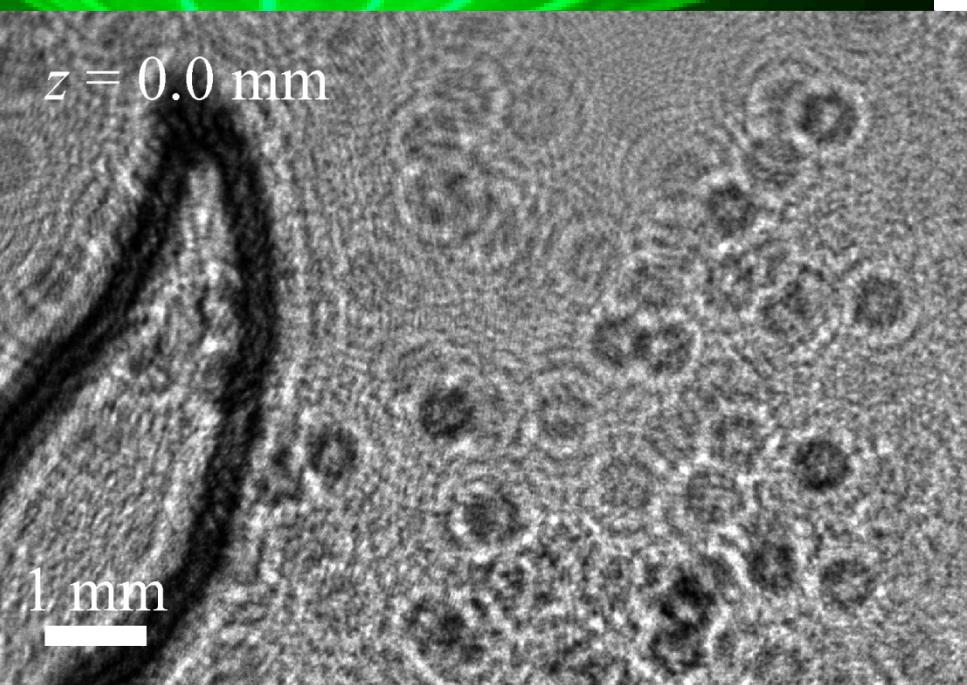

Advantages: (1) no darkroom, (2) temporal resolution (3) numeric refocusing and post-processed

Challenge: Resolution of sensors (order 100 line pairs/mm; compared to photograph, order 5,000 line pairs/mm)

$z = 0.0 \text{ mm}$

1 mm
