

*Exceptional service in the national interest*

Sandia  
National  
Laboratories

# An Overview of AM Activities & Capabilities at Sandia

Aaron Hall, Bradley Jared  
Materials Science & Engineering Center

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

# SNL's Additive Interest

- Reduce risk, accelerate development
  - simplify assembly & processing
  - prototypes, test hardware, tooling & fixturing
    - > 75-100 plastic machines
    - cost reductions often 2-10x
- Add value
  - design & optimize for performance, not mfg
    - complex freeforms, internal structures, integration
  - engineered materials
    - gradient compositions
    - microstructure optimization & control
    - multi-material integration

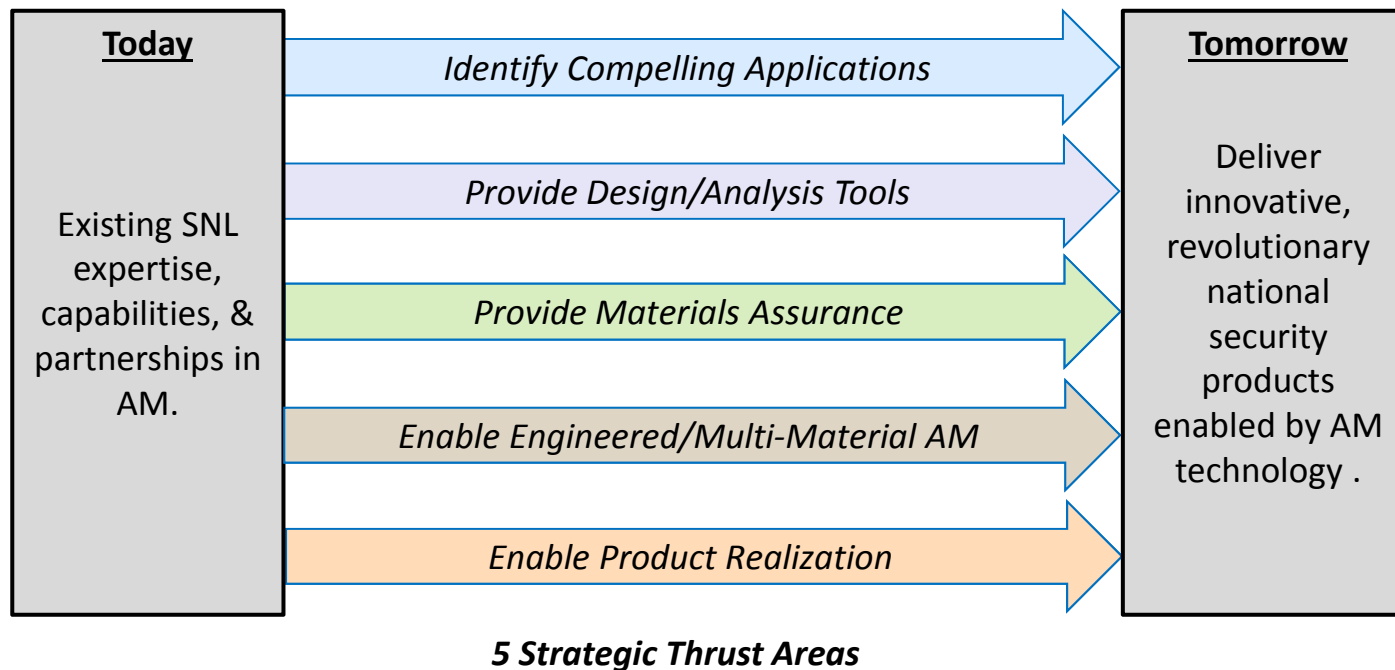

prototype  
AI AM  
mirror &  
structure

fixture generated in 1 day

# SNL's Additive Strategy

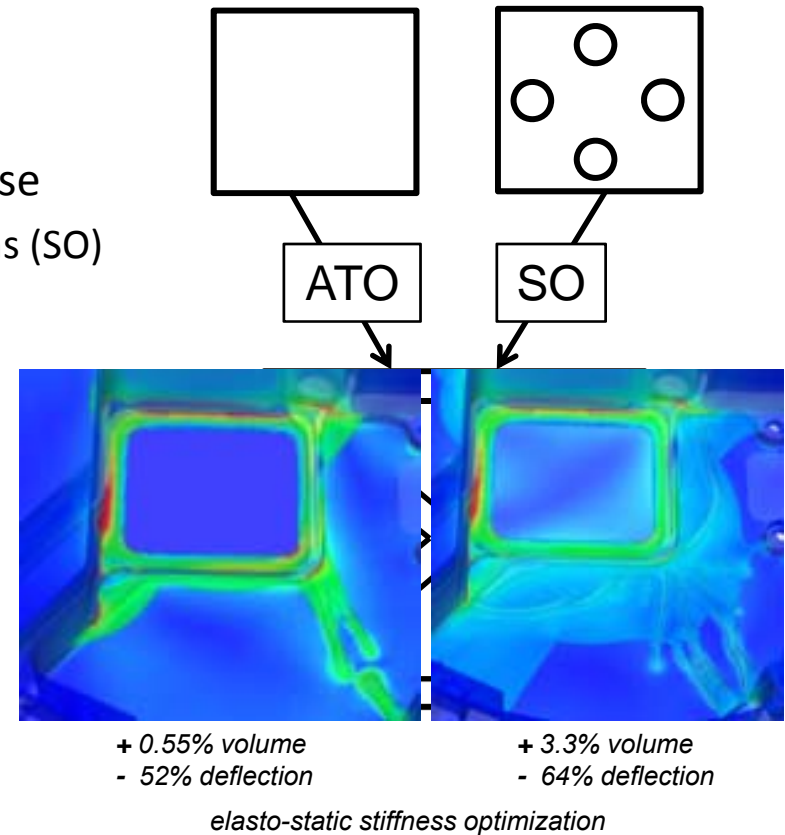

***Vision:*** We will deliver innovative national security products – impossible to create with traditional technologies – by exploiting the revolutionary potential of Additive Manufacturing.

# New Design Freedom

- Computational synthesis for optimal material use
  - adaptive topological (ATO) & shape optimizations (SO)
  - leverages “complexity is preferred”
  - constrained by performance requirements
  - bio-mimicry requires AM
  - design occurs concurrent w/simulation

solution for a bar in pure torsion resembles a cholla cactus

# Optimization Impact

Optimized design (using same mass and material, i.e., carbon phenolic) achieves 39% average increase in modes of interest, compared to 23% increase achieved by printing original design in aluminum.

*Design optimization provides  
performance improvements  
unachievable with materials alone*

# Predicting Performance Margins (PPM)

Multi-scale simulation & experiments are necessary to understand & predict material variability

simulations

experiments

**Atomic scale  
phenomena**  
 $10^{-9}$  m  $10^{-9}$  s

**Single crystal  
behavior**  
 $10^{-6}$  m  $10^0$  s

**Microstructural  
effects**  
 $10^{-3}$  m  $10^3$  s

**Material  
performance**  
 $10^0$  m  $10^6$  s

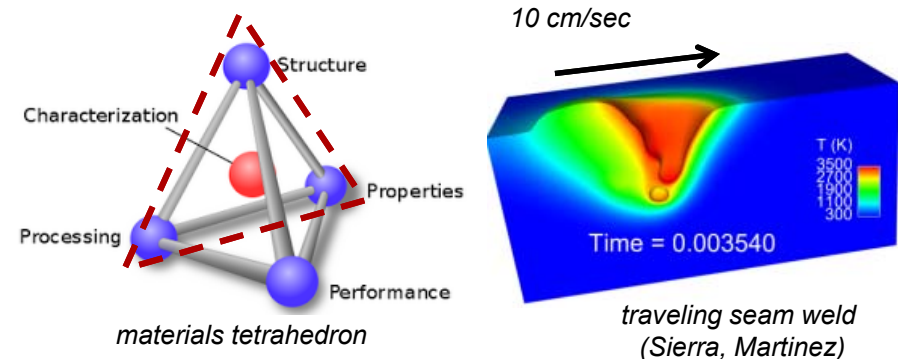

Atoms-up: Develop physics-based models to provide scientific insight

Continuum-down: Augment engineering-scale models to provide improved fidelity

# New Material Assurance Paradigm

- Quantify process-structure-property relationships
  - process maps, constitutive models & HPC simulations
  - *understand behavior & formation of critical defects*

- Implement process control
  - start w/in-situ monitoring
    - establish property bounds & control needs
  - predictive process control
    - defect prevention (and correction?)
    - material optimization

- Leverage experience in LENS®, laser welding, thermal spray, casting

LENS® control of  
melt pool &  
microstructure

# Metrology Artifacts

- Unique challenges for process & equipment characterization
  - part geometry = function (material, print orientation, support structures, post-processing,...)
  - equipment generally exceeds process
- Family of artifacts designed, printed & measured
  - fabrication has been easier than metrology
  - working to show utility for predictive process inputs
  - interest for process feedback

*Ti-6Al-4V polyhedron & "Manhattan" artifacts for MPE (maximum permissible error)*

*Siemens star geometries for resolution evaluation*

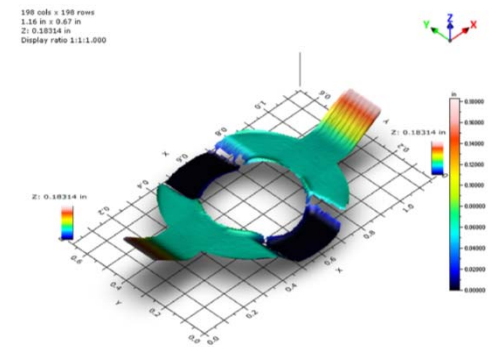

*17-4PH polyhedron texture anisotropy map*

*Ti "Manhattan" error map*

# Powder Bed Fusion

- Powder melts @ focal point, then re-solidifies
  - electron beam melting (Arcam)
  - laser based (term varies w/vendor)
  - growing activity exploring metal parts
- 3D System machines purchased
  - process characterization & materials science
  - open architecture controller
  - three machines (2 in NM, 1 in CA)
- Performance
  - dimensional accuracy
    - best ~ 0.001-0.002", but scales w/part
  - surface finish
    - >5  $\mu\text{m Sa}$  (~ casting), worse for downward surfaces
  - geometry limits
    - wall thickness > 100  $\mu\text{m}$ , overhangs < 45°
  - single material parts
    - Ti6Al4V, AlSi10Mg, 6061-T6, 316L SS, 17-4, 15-5, maraging steel, CoCr, Inconel 625 & 718, Au, Ag, W
      - > 99% density
    - ceramics: alumina, WC, cermet
      - 90% dense, 10  $\mu\text{m}$  finish

# Laser Engineered Net Shaping (LENS®)

- Historical
  - extensive SNL development efforts & investments
  - licensed to Optomec
  - foundation for metal additive research
- Custom research machine
  - re-establishing & expanding capability
    - additive & subtractive
    - deposition head designed for process diagnostics & feedback
  - leveraging existing hardware

*LENS functionally graded materials*

*thermal history during bi-directional metal deposition*

# Direct Write

- Ink jet

- discrete droplets produce continuous line segments
- line width a function of droplet size
  - diameter: 18-635  $\mu\text{m}$
- material viscosity: 1-1x10<sup>6</sup> cPs

- Aerosol jet

- ink atomized to produce dense aerosol mist
- aerosol focused w/inert gas streams & small nozzle
- Ag: 10  $\mu\text{m}$  line width, 0.5-3  $\mu\text{m}$  height

- Extrusion casting

- volume deposition: 20 pl minimum
- material viscosity: 1-1x10<sup>6</sup> cPs

extrusion casting (Robocasting)

# Energetic Materials

## Robocasting

Aluminum/Nickel reactive material

Tappan, A.S., Groven, L.J., Ball, J.P., Miller, J.C., Colovos, J.W., Joseph Cesarano, I., Stuecker, J.N., and Clem, P., "LDRD Final Report: Free-Form Fabrication and Precision Deposition of Energetic Materials," SAND2008-0965, February, 2008.

## Inkjet printing

Aluminum/bismuth trioxide thermite

Tappan, A.S., Ball, J.P., and Colovos, J.W., "Inkjet Printing of Energetic Materials: Al/MoO<sub>3</sub> and Al/Bi<sub>2</sub>O<sub>3</sub> Thermite," *The 38th International Pyrotechnics Seminar*, Denver, CO, June 10–15, 2012.

## Physical vapor deposition

Pentaerythritol tetranitrate high explosive

Tappan, A.S., Knepper, R., Wixom, R.R., Marquez, M.P., Miller, J.C., and Ball, J.P., "Critical Thickness Measurements in Vapor-Deposited Pentaerythritol Tetranitrate (PETN) Films," *14th International Detonation Symposium*, Coeur d'Alene, ID, April 11-16, 2010.

- Different materials and applications require different techniques

# Thermal Spray

- SNL has all major thermal spray processes
  - plasma spray (atmosphere, vacuum), twin wire arc spray, powder flame spray, wire flame spray, cold spray, high velocity oxy-fuel
- Advantages
  - large material set (anything that melts)
    - pure metals, most alloys, traditional ceramics, cermet, carbides, polymer, composites, MMC
    - graded materials
    - able to deposit on lower-melting substrates
  - surface properties differ from bulk
  - high build rates over large areas (10 - 100 lb/hr)
    - thick deposits (mm to cm)
  - cold spray
    - solid state deposition, no composition changes or solidification stresses
    - near wrought properties w/heat treat

\*Adapted from plots by R.C. McCune, Ford Motor Co. & A. Papyrin, Ktech Corp.

Cold spray Aluminum deposits exhibit near-wrought properties after annealing.

ASTM E8 tensile bars machined from 1/2" thick aluminum deposits

*Spray deposits exhibit wrought properties (11% strain to failure and classic cup-and-cone ductile fracture surfaces) after 300°C anneal!*

- Aluminum deposit 4"x4"x1/2" thick prepared at Sandia National Laboratories using cold spray.
- Total build time was less than 20 minutes! Aluminum was not melted in this process!
- Solid state deposition proven for: Al, Ti, SS, Cu, Ni, and Ta alloys

Cold spray offers an important alternative to melt-based deposition techniques currently used for 3-D printing.

# Nanocrystalline 6061 Aluminum Prepared Using Cold Spray

***Fine grained material needed to manufacture meso-scale mechanical components***

**30- 50 nm grains**

- Minimum grain size for Aluminum is ~ 20 nm
- Dislocations are unstable in Aluminum grains smaller than 18nm
- Plastic deformation is responsible for grain refinement in LN<sub>2</sub> ball milled and cold sprayed aluminum

***No discernable texture!***

***The nanocrystalline coating has ~ double the hardness of conventional cold sprayed 6061 Al.***

Sample ID	Depth (nm)	Avg.'d CSM results (100-200nm)		Results using Unloading Curve	
		E (GPa)	H (GPa)	E (GPa)	H (GPa)
6061 T6 Bulk Wrought	1000	87.5±3.6	1.464±0.132	85.7±2.0	1.411±0.028
6061 T6 Bulk Wrought	250	86.7±1.6	1.450±0.054	89.3±8.2	1.385±0.044
6061 coating as-received powder	1000	87.9±3.3	1.322±0.278	90.8±5.5	1.349±0.169
6061 coating as-received powder	250	86.7±3.4	1.363±0.458	92.4±10.1	1.347±0.325
6061coating LN2 milled powder	1000	84.4±1.6	2.621±0.309	86.0±2.6	2.306±0.275
6061 coating LN2 milled powder	250	83.9±1.7	2.715±0.198	90.4±5.9	2.416±0.172

# Cold Spray Copper-Tungsten MMC

- Cu coated W powder deposits readily
- Cu-W critical velocity is significantly lower than Cu, as predicted by particle density increase
- W loss occurs during deposition
- Cu coating separates from the W particles
- W fracture occurs during deposition at high W loadings (>85%)
- Reducing particle velocity did not reduce tungsten loss
- Coating adhesion and interfaces matter in Cu-W feedstock.

*Cu-W metal coated  
powders deposit beautifully;  
but are changed by the cold  
spray process!*

# Moly Thermoelectric Module Interconnect

## Feasibility of Air Plasma Sprayed (APS) Mo interconnects

- Laser-cut high temp polymer (400°C) mask
- Results show great potential:
  - Feature size ~250  $\mu\text{m}$
  - ~170  $\mu\text{m}$  spacing
  - Dense & low porosity coating
  - High electrical conductivity
- APS is a fast, efficient, and inexpensive method for Mo coatings as interconnects.

Mo plasma sprayed coating through  
Laser-patterned Polymer Mask

Coated thermoelectric module

*Plasma spray processes  
can be used to create  
surprisingly small features  
using straightforward  
masking techniques!*
