S. A. MacLaren, P. Michel, L. Divol

17 June 2017

# Summary: towards predictive rad-hydro + laser-plasma modeling

- Same “best current” rad-hydro for all shots<sup>1</sup>
  - O. Jones et al., Phys. Plasmas 2017
  - No per-shot multipliers
  - DCA model
  - Electron flux limit 0.03
  - Cross-beam energy xfer clamp  $\delta n_e/n_e=0.01$
- New in this work: backscatter
  - **DEplete**: ray-based extension of linear gain
  - **pF3D**: paraxial-envelope code: speckles, polarization smoothing, SSD, etc.
- NIF “bigfoot” shot
  - CBET (calculated) to outer cones
  - Outer-cone SBS: 10-15% end of pulse
  - Deplete and pF3D: less increase vs. time
  - Both codes: SBS from gold bubble

Continued improvement in both rad-hydro and LPI modeling

Simulations: too much x-ray drive, esp. for long pulses, high fill density

# Rad-hydro model: “best current” physics in Lasnex<sup>1</sup>

- **Opacity + EOS**

- LTE tables for  $T_e < T_{\text{crit}}$ , non-LTE DCA for  $T_e > T_{\text{crit}}$
- $T_{\text{crit}} = 300$  eV in wall, 50 eV elsewhere
- DCA models: March 2014
- Gold: dca\_79x5 – improved gold bubble physics
- Bug: over-emits x-rays with radiation field: H. Scott

- **Laser**

- Escaping backscatter power removed from incident laser – no inline SRS/SBS
- Inverse brems. absorption + Langdon effect
- Inline CBET: unpolarized quads, saturation  $\delta n_e/n_e = 0.01$
- Ponderomotive force: needed for CBET momentum deposition

- **Electron heat conduction**

- Heat flux  $q = \min(q_{\text{SH}}, f n_e T_e v_{Te})$
- $q_{\text{SH}}$  = Spitzer-Harm + Lee-More corrections
- flux limit  $f = 0.03$  everywhere
- No MHD, nonlocal, ion turbulence models

2D RZ axisymmetric  
Only bottom half:  
BS diagnostics there

FABS,  
NBI detectors

<sup>1</sup>O. Jones et al., Phys. Plasmas 2017

# Rad-hydro model: numerics / logistics

- No ad-hoc / per-shot multipliers: power, cone fraction, ...
- LHT (Lasnex Hohlräum Template) version-controlled input deck
  - Needed to handle multiple shots + multiple designers
  - Based on deck from Cliff Thomas, from Richard Town, Peter Amendt, etc.
- Same Lasnex version: 13 April 2017
- **Numerical resolution:** O. Jones' "hi-res" settings from convergence study<sup>1</sup>
  - Capsule: 72 angular zones in  $90^\circ \rightarrow \Delta\theta = 1.25^\circ$
  - Wall: innermost zone  $\Delta r = 4$  nm,  $\Delta r$  increases by 1.03x
  - 180 radiation energy groups
  - 10 zones across LEH window thickness
- **Mesh:** "As Lagrangian As Reasonably Achievable"\*
  - ALE (Arbitrary Lagrangian-Eulerian) mesh management: R. Tipton
  - Hohlräum: ALE from  $t=0$ , may freeze mesh after laser is off
  - Capsule: ALE from user-determined  $t>0$ , mesh not frozen
- **Laser:** 600 rays per quad, CBET iteration options

<sup>1</sup>O. Jones et al., Phys. Plasmas 2017

\*N. Meezan, private communication (2007)

# Energetics across a set of NIF shots

Drive deficit:

- Rad-hydro codes over-predict x-ray drive in NIF hohlraums
- Long-standing issue
- Especially for long pulses, high gas fill density, and high backscatter

# “Bigfoot”<sup>1</sup> shot N170109

## Bigfoot

- 1st and 2<sup>nd</sup> shocks overtake in ablator, before reaching DT fuel
- “Robust” hotspot: high adiabat, lower convergence, high  $\rho \cdot R$
- Less prone to hydro instabilities (e.g. Rayleigh-Taylor) and loss mechanisms
- At price of lower 1D gain

$\Delta\lambda = 0$ : CBET due to plasma flow only

### “Quad splitting”:

- Spread out outer beam spots on wall
- 4 beams in an outer quad split in azimuth
- 44’s and 50’s separated in Z

### Benefits:

- Less azimuthal variation
- Lower intensity → lower SBS
- Less M-band x-rays
- Less wall / bubble motion

<sup>1</sup>C. A. Thomas, APS DPP 2016 invited talk

# Bigfoot shot N170109: SBS late in time on cone 50

Q31B FABS: quad on cone 30

Q36B FABS: quad on cone 50

## Drive diagnostic sensors

SBS in  $\geq$  one beam on every quad:

- More SBS on cone 50 than 44

# Bigfoot: calculated CBET to outers, especially 50's

From cone 30: transfer TO 44's and 50's

From cone 50: transfer FROM all other cones

Net transfer to each cone

Cone fraction = Inner / Total power

NIF Shot  
N170109

# DEplete<sup>1</sup>: ray-based, steady-state backscatter calculations, extension of linear gain

$$\frac{d}{dz} I_0(z) = -\kappa_0 I_0 - I_0 \int d\omega_1 \frac{\omega_0}{\omega_1} (\tau_1 + \Gamma_1 i_1)$$

$$-\frac{\partial}{\partial z} i_1(z, \omega_1) = -\kappa_1 i_1 - \Sigma_1 - I_0 (\tau_1 + \Gamma_1 i_1)$$

|                        |                 |                       |                     |
|------------------------|-----------------|-----------------------|---------------------|
| inv. brems.<br>damping | brems.<br>noise | Thomson<br>scattering | SBS/SRS<br>coupling |
|------------------------|-----------------|-----------------------|---------------------|

**DEplete gain:**

$$G = \ln \frac{i_1(\omega, z_0)}{i_1^{brem}(\omega, z_0)}$$

noise level without laser =  
scattered light with just  
brem. emission + absorption

## **Features of DEplete:**

- Uses 1-D plasma conditions from 3-D ray-trace
- Spectrum of scattered frequencies
- Strong damping limit for plasma waves
- Pump depletion of laser
- Thomson scatter/bremsstrahlung noise sources
- Inverse-bremsstrahlung light wave damping
- Linear kinetic coupling coefficients
- Collisional plasma-wave damping

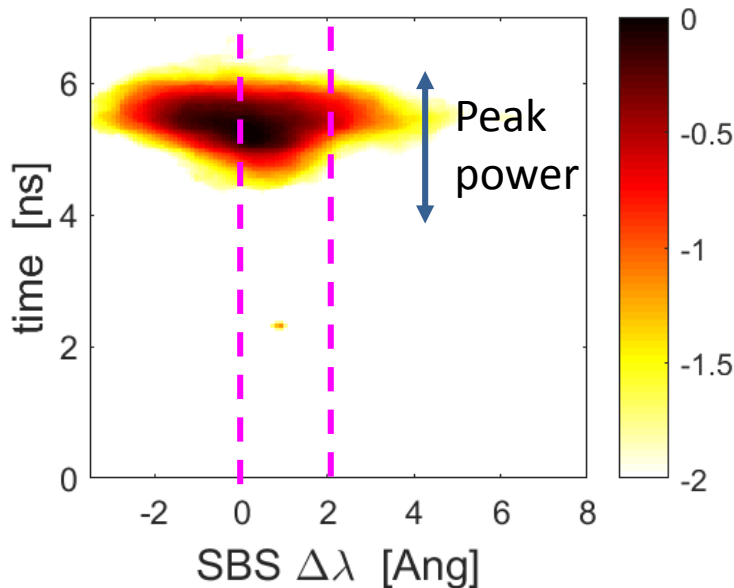

## **DEplete lacks:**

- Temporal effects
- Laser speckles
- PS, SSD
- Dewandre effect
- Multi-D effects, e.g.  
refractive intensification

<sup>1</sup>D. J. Strozzi, E. A. Williams, D. E. Hinkel, D. H. Froula, R. A. London, D. A. Callahan, Phys. Plasmas 2008

# Bigfoot: Cone 50 SBS spectrum vs. DEPLETE<sup>1</sup>

Measured SBS spectrum:  
Shot N161204 (Symcap)

Ray-averaged DEPLETE gain spectrum:  
Shot N170109 (layered DT)

- DEPLETE spectrum redshifted by  $\sim 2$  Ang. vs data
- Neglects SSD bandwidth, “Dewandre effect” (wavelength shift due to time-dependent electron density)

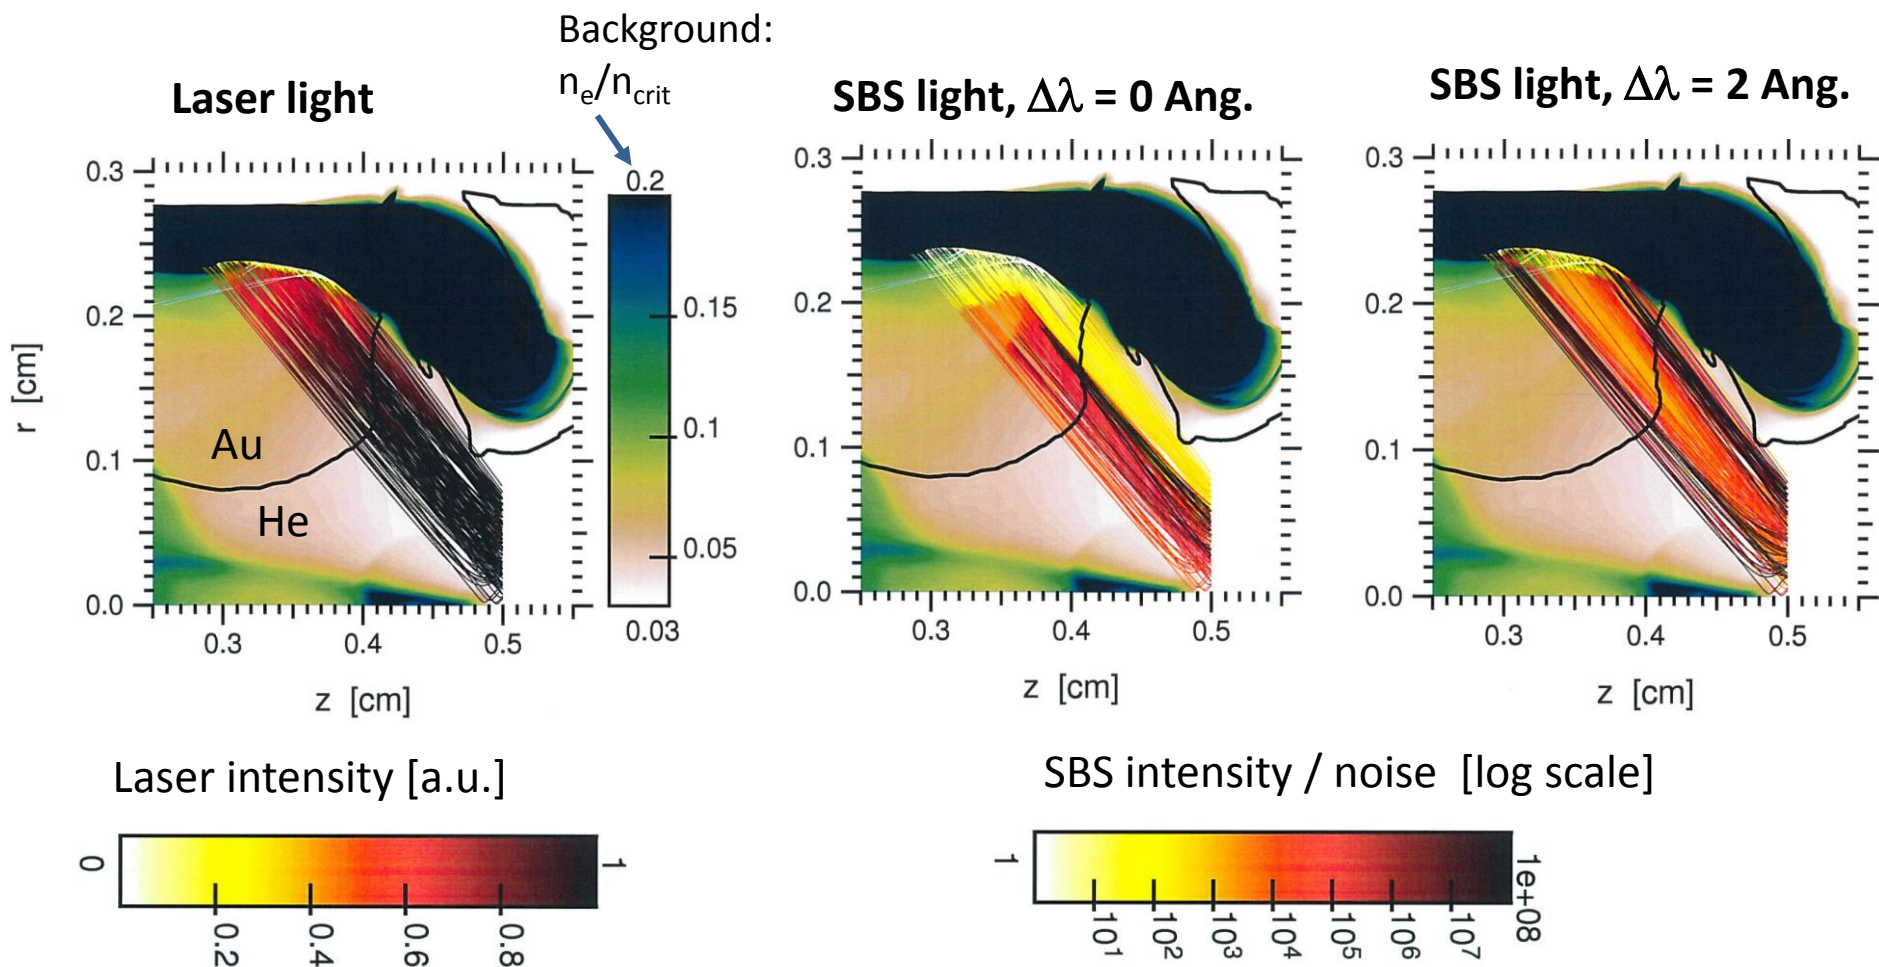

Shot N161204 – symcap, has SBS spectrum, analog of DT shot N170109 – no SBS spectrum

<sup>1</sup>D. J. Strozzi, E. A. Williams, D. E. Hinkel, D. H. Froula, R. A. London, D. A. Callahan, Phys. Plasmas 2008

# DEplete: Cone 50 SBS develops in gold bubble

N170109

5.75 ns: late peak power

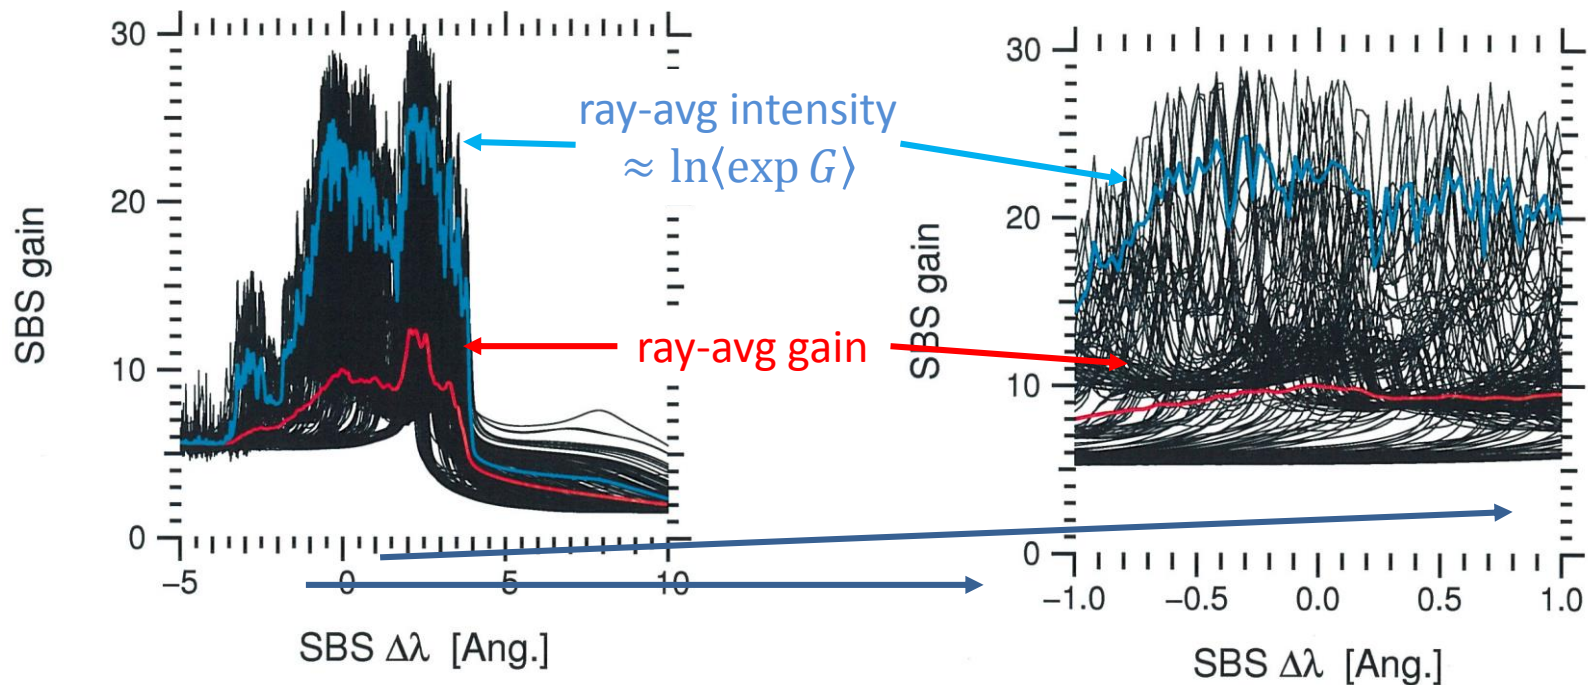

# Each ray has narrow SBS resonance at different wavelength<sup>1</sup>

N170109

5.75 ns: late peak power

Cone 50 SBS gain spectrum:  
all rays

<sup>1</sup>L. Tolstoy, *Anna Karenina* (1878)

# Ion waves weakly damped for $ZT_e/T_i \gg 1$ : e.g. gold

IAW Landau damping rate: gold

$$T_e = 2T_i, \quad k\lambda_{De} = 0.6$$

SBS spectrum

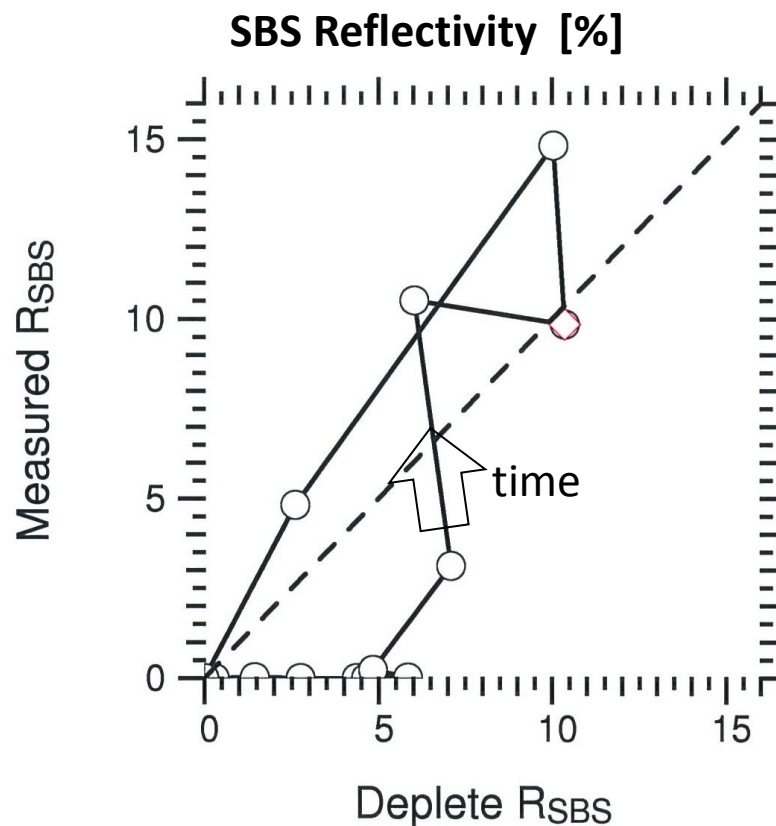

Electrons

Ions

$$\frac{\nu}{\omega} \propto \left( \frac{Zm_e}{m_i} \right)^{\frac{1}{2}} \exp \left[ -\frac{Zm_e}{2m_i} \right] + \frac{1}{2} \left( \frac{ZT_e}{T_i} \right)^{\frac{3}{2}} \exp \left[ -\frac{ZT_e}{2T_i} \right]$$

# Cone 50 SBS: Measured and Deplete reflectivities qualitatively track vs time

NIF Shot N170109

Deplete reflectivity: sum over rays of wavelength-integrated SBS intensity

# Cone 50 SBS: pF3D<sup>2</sup> simulations close to measured reflectivity, when CBET included

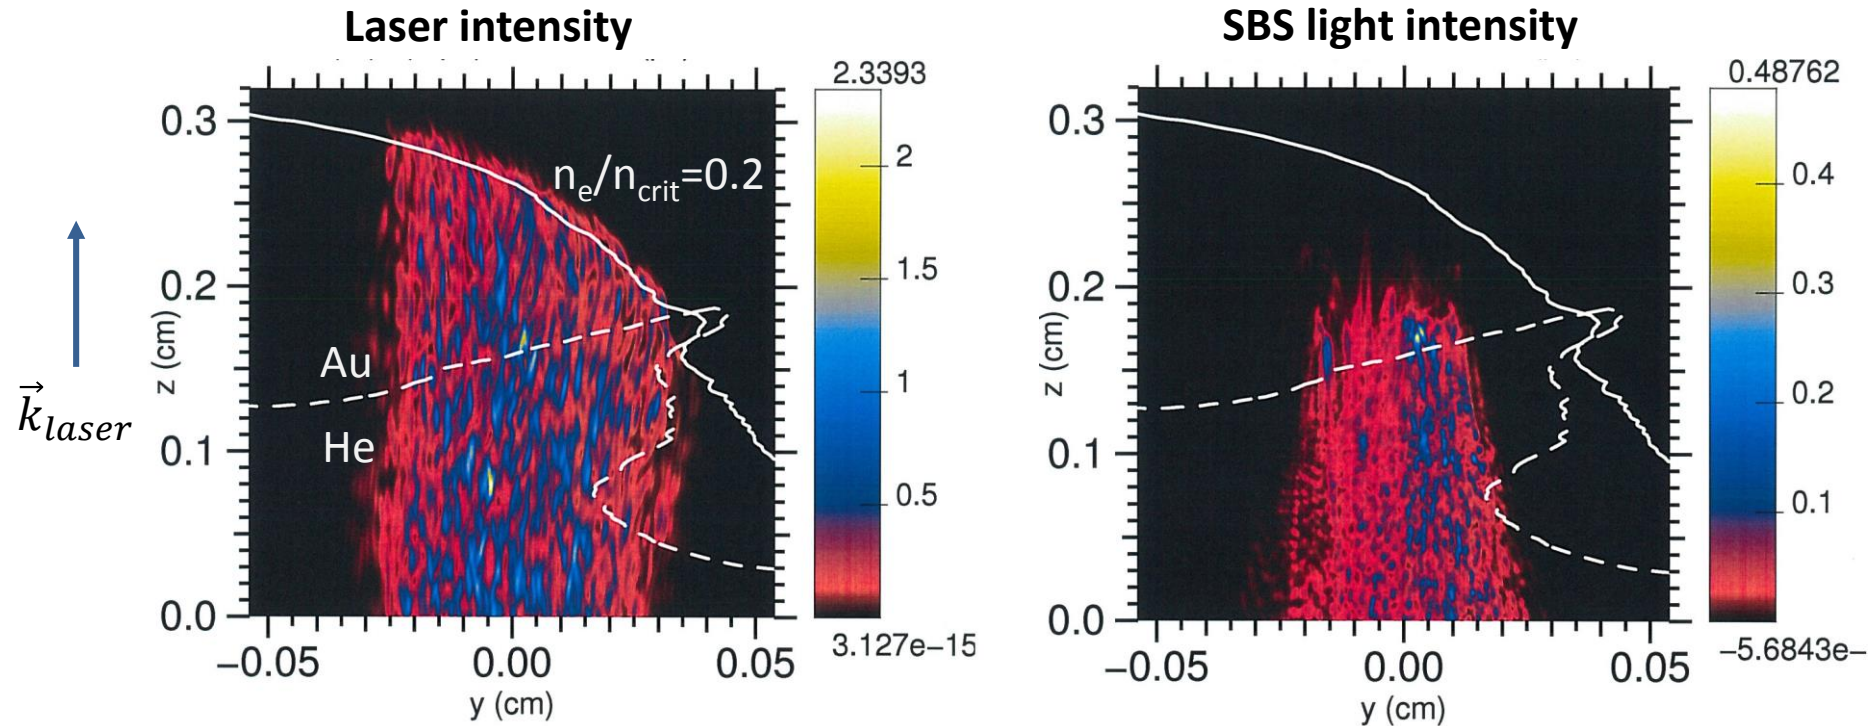

NIF Shot  
N170109

pF3D simulations by R. L. Berger

<sup>2</sup>R. L. Berger, C. H. Still, E. A. Williams, A. B. Langdon, Phys. Plasmas 1998

# pF3D: outer SBS growth localized in gold bubble

- pF3D run includes one  $48^\circ$  and one  $52^\circ$  beam – each orthogonally polarized
- $50^\circ$  quad has two other beams: spatially separated at wall due to “quad splitting”
- Plots in pF3D coordinates: laser propagates in  $z$

# Conclusions and future work

## “Best current” rad-hydro model in Lasnex

- DCA 2014 + 79x5 model for gold
- Electron flux limit 0.03
- Inline CBET: saturation clamp  $\delta n_e/n_e = 0.01$
- Simulated x-ray flux too high, bangtime early

## “Bigfoot” shot N170109

- CBET modeling: CBET to outers, increases in time
- Backscatter: mostly cone 50 SBS, peaks late in time
- Cone 50 SBS modeling: DEplete and pF3D
  - Similar reflectivity to data, when CBET included
  - Increase with time less than data

## Future work

- Apply to more shots, more LPI data – inner SRS, SBS in beams within quad
- Suggest rad-hydro modeling improvements, e.g. gold bubble
- Use improved rad-hydro models as available
