SAND2016-XXXX

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

# Overview

- Introduction
- High-Flux Solar Simulator Design
- Automated Sample Handling & Exposure System
- Conclusions

# Background

- Need for controlled, high-flux, high-T exposure tests

**Solar Furnace**

**Solar Simulator**

- Concentrates sunlight
- Operational up to ~6 hours/day
- Weather dependent

- Concentrates light from lamps
- Continuous operation
- Not weather dependent

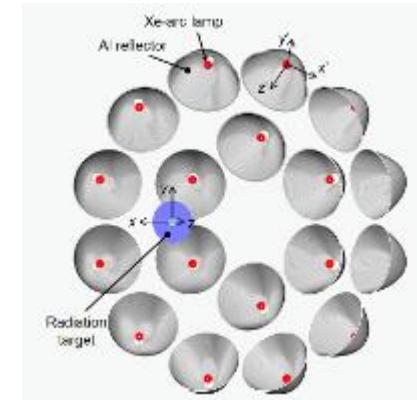

# High-Flux Solar Simulators Around the World

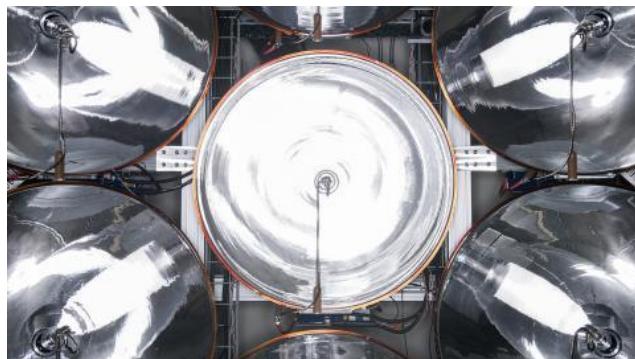

50 kW<sub>e</sub> 8,500 suns, 7 Xenon-arc lamps, University of Minnesota

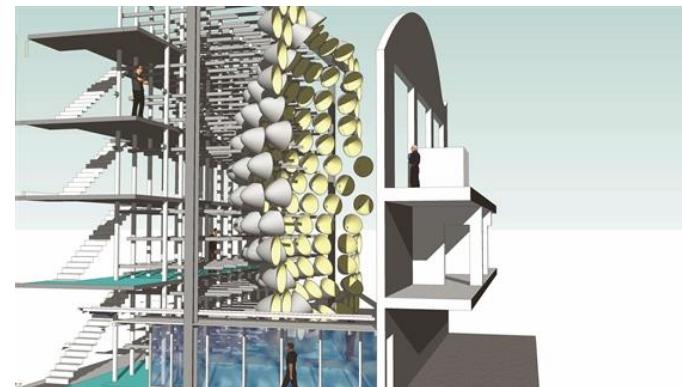

150 kW<sub>e</sub>, 11,000 suns, 10 Xe-arc lamps, Paul Scherrer Institute, Switzerland

45 kW<sub>e</sub>, 9,500 suns, 18 Xe-arc lamps, Australian National University

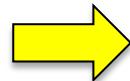

42 kW<sub>e</sub>, 7 Xe-arc lamps  
Georgia Tech University

SynLight, 1 MW<sub>e</sub>, 149 Xe-arc lamps, DLR, Germany

# Problem Statement & Objective

- All previous examples utilize horizontal aiming and have single, stationary sample exposure

**Develop beam down system with Automated Sample Handling & Exposure System (ASHES)**

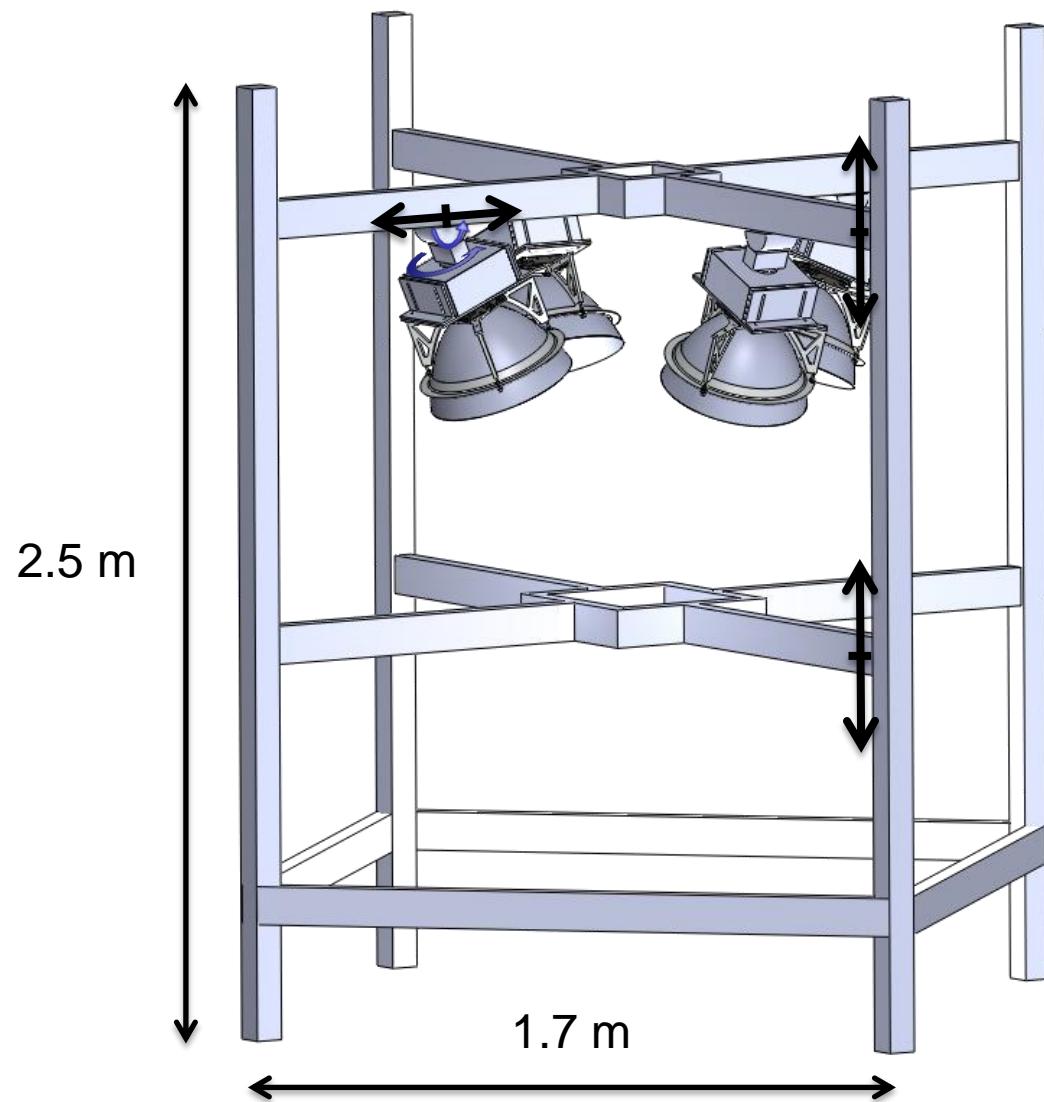

# Overview

- Introduction
- High-Flux Solar Simulator Design
- Automated Sample Handling & Exposure System
- Conclusions

# Base Construction

Boubault et al. (2015)

- Beam-down design
  - Easier positioning of samples
  - Mitigates risk of exposure
- Metal Halide lamps
  - Larger arc – less concentration
  - Cheaper than Xenon-arc
  - Matches solar spectrum

# Construction

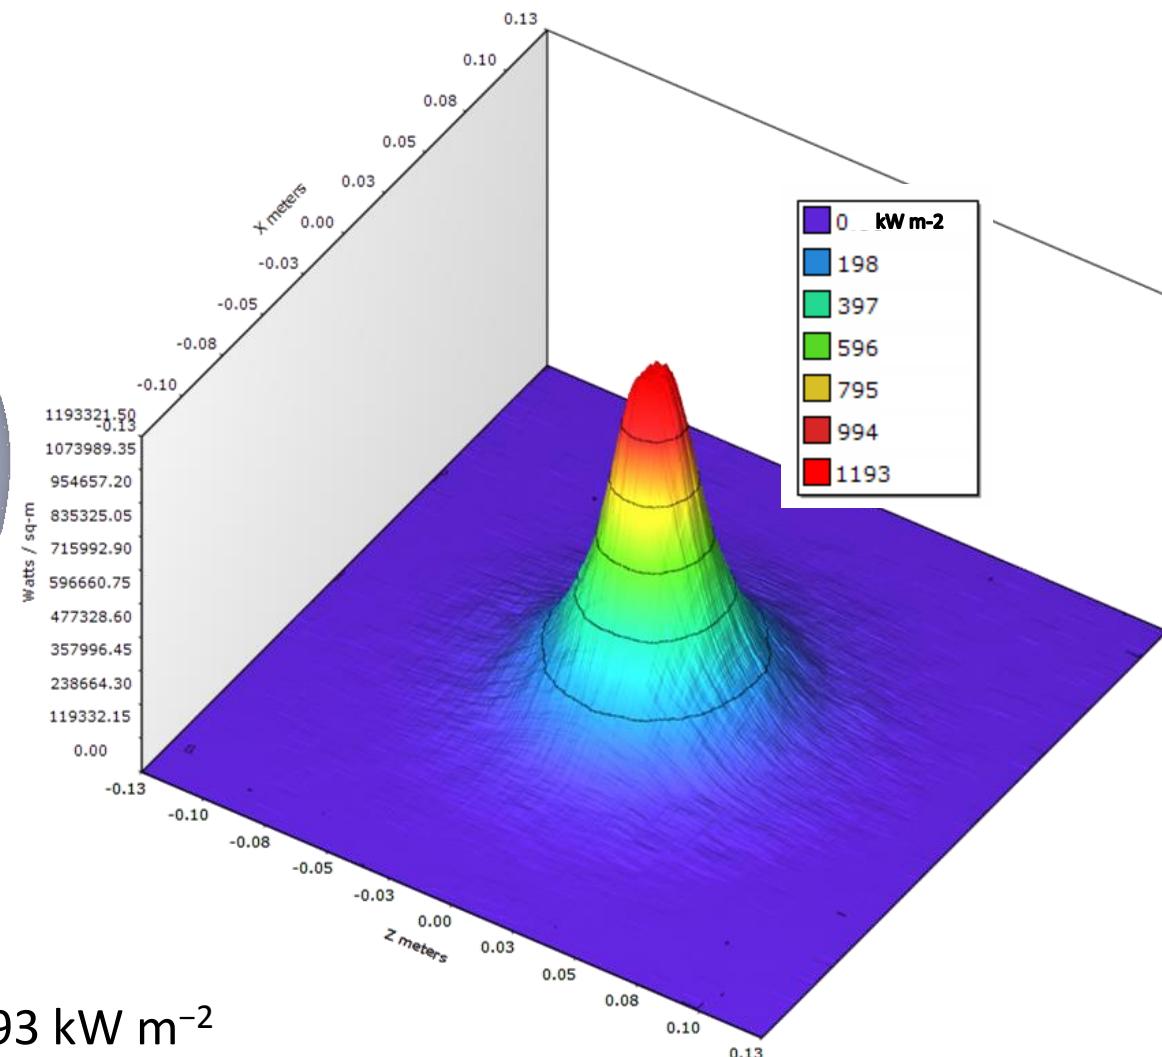

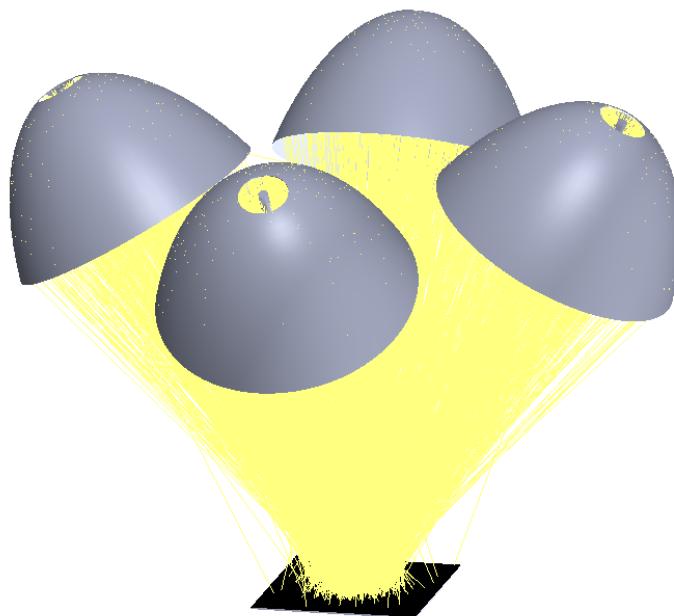

- Completion
  - Protective walls
  - UV proof windows
  - Instrumented with thermocouples
  - Control of operation and safety shutdown with a Labview application

# Characterization

Boubault et al. (2015)

## ■ Irradiance

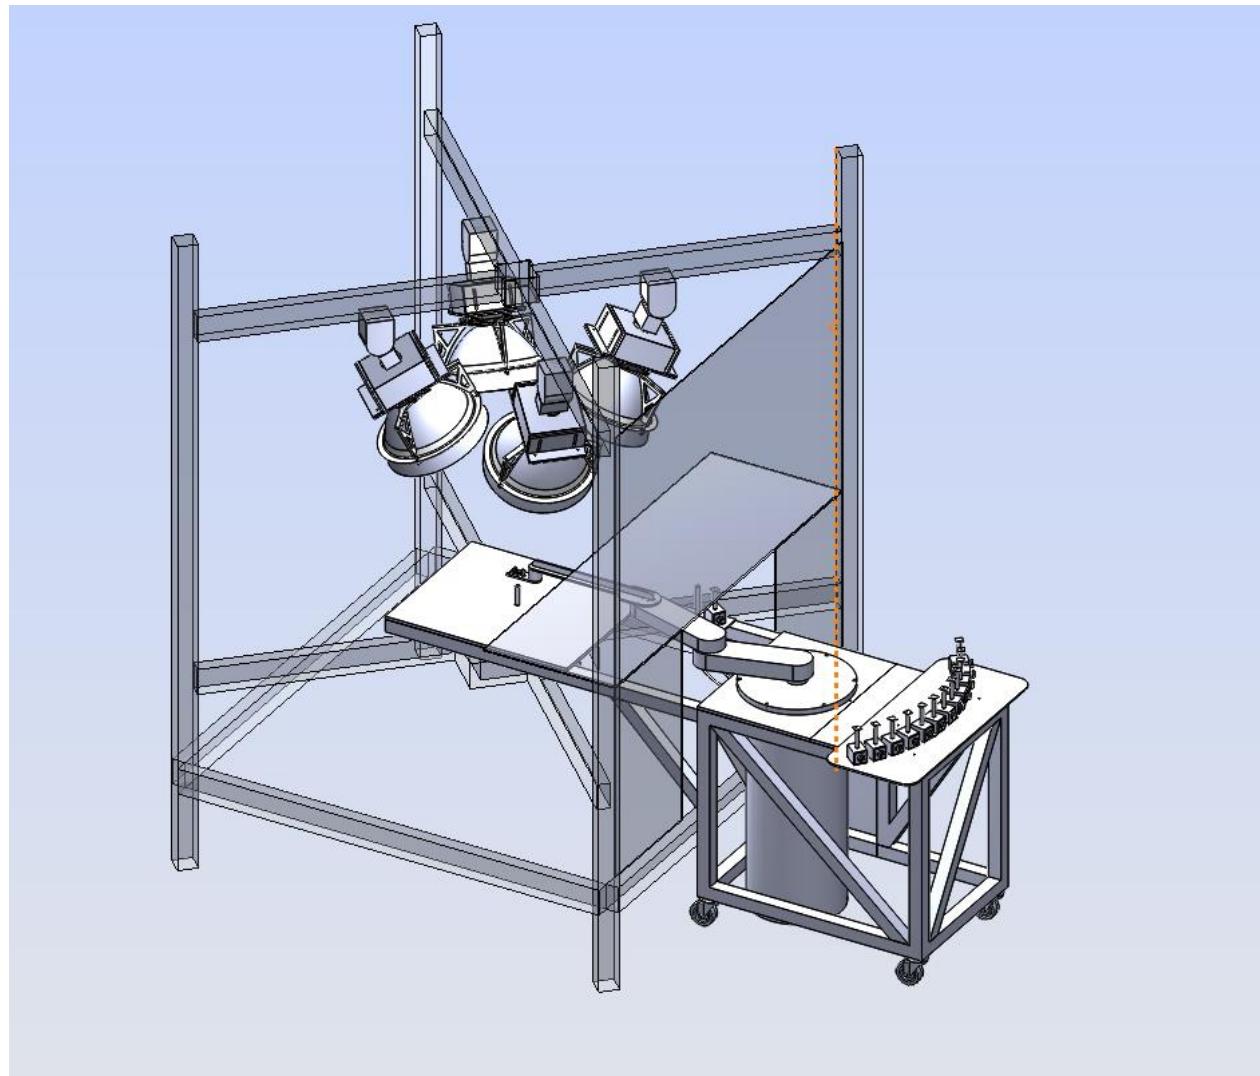

- Peak irradiance =  $1193 \text{ kW m}^{-2}$
- Average irradiance (2.5 cm spot) =  $1071 \text{ kW m}^{-2}$

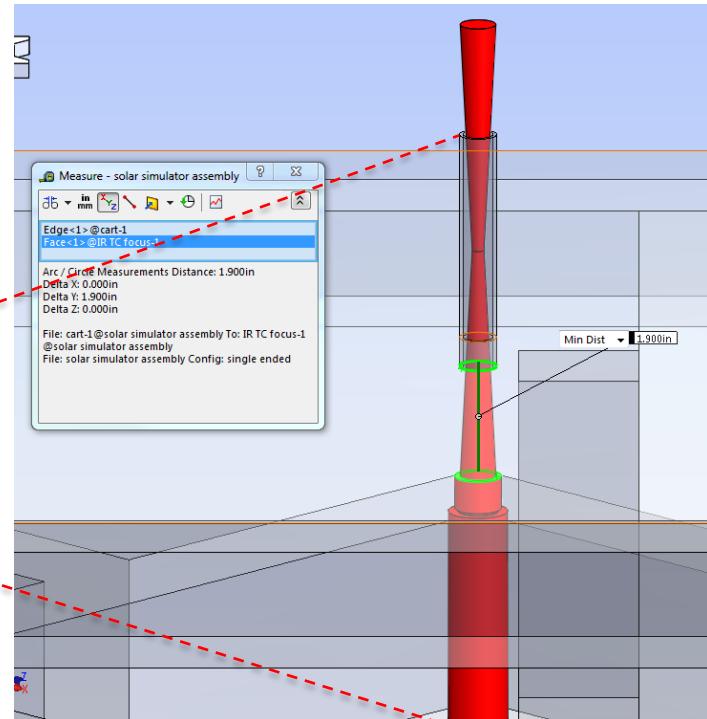

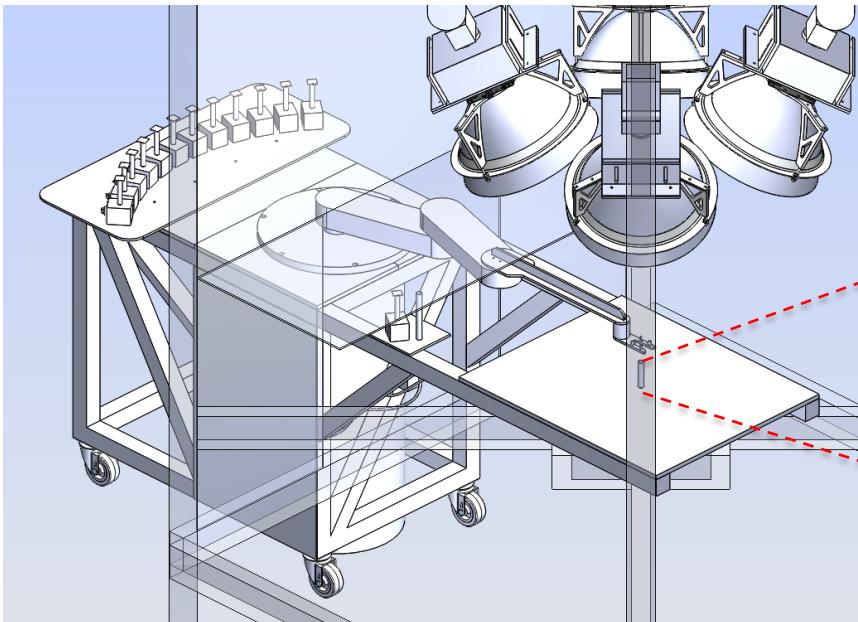

# Overview

- Introduction
- High-Flux Solar Simulator Design
- Automated Sample Handling & Exposure System
- Conclusions

# ASHES Design

# ASHES Design

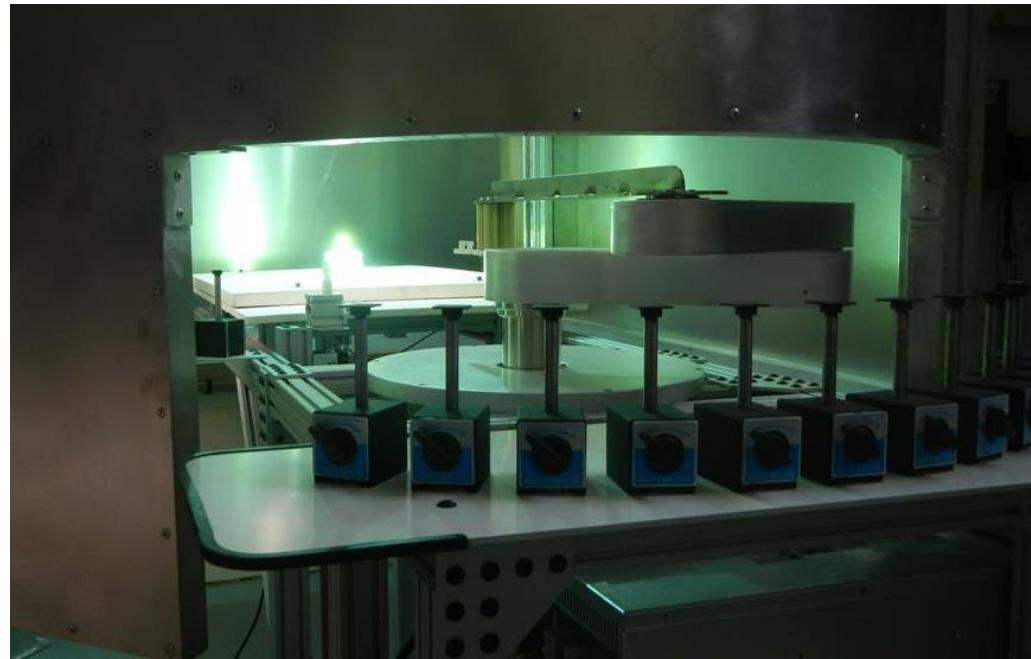

IR sensor measures sample  
temperature

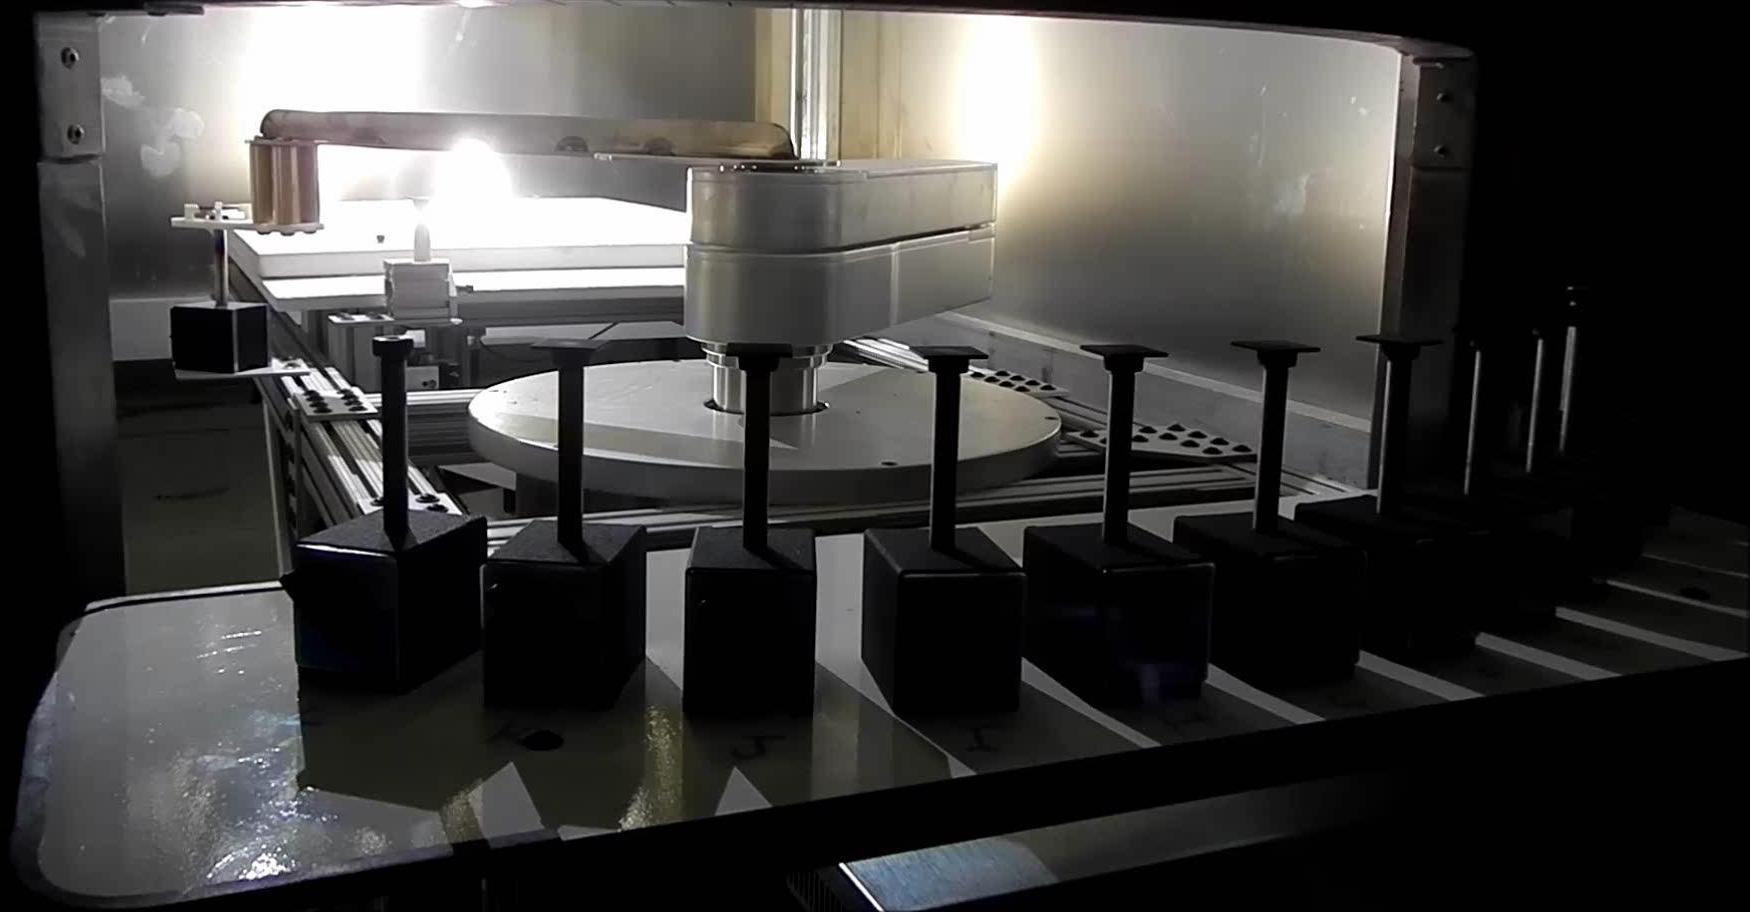

# ASHES - Photos

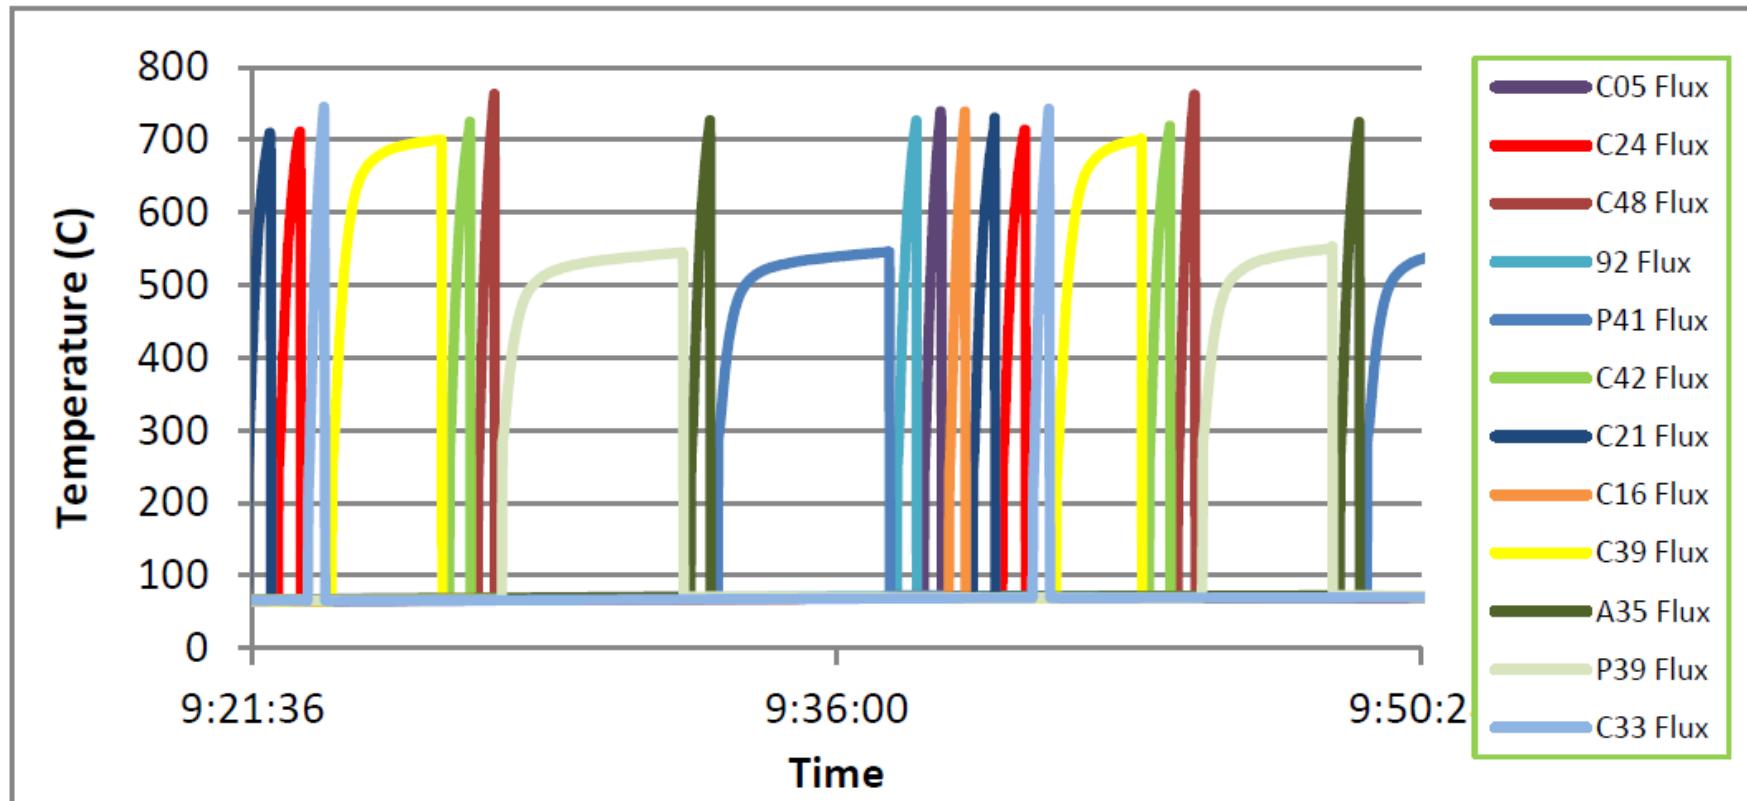

# ASHES - Photos

# ASHES Video

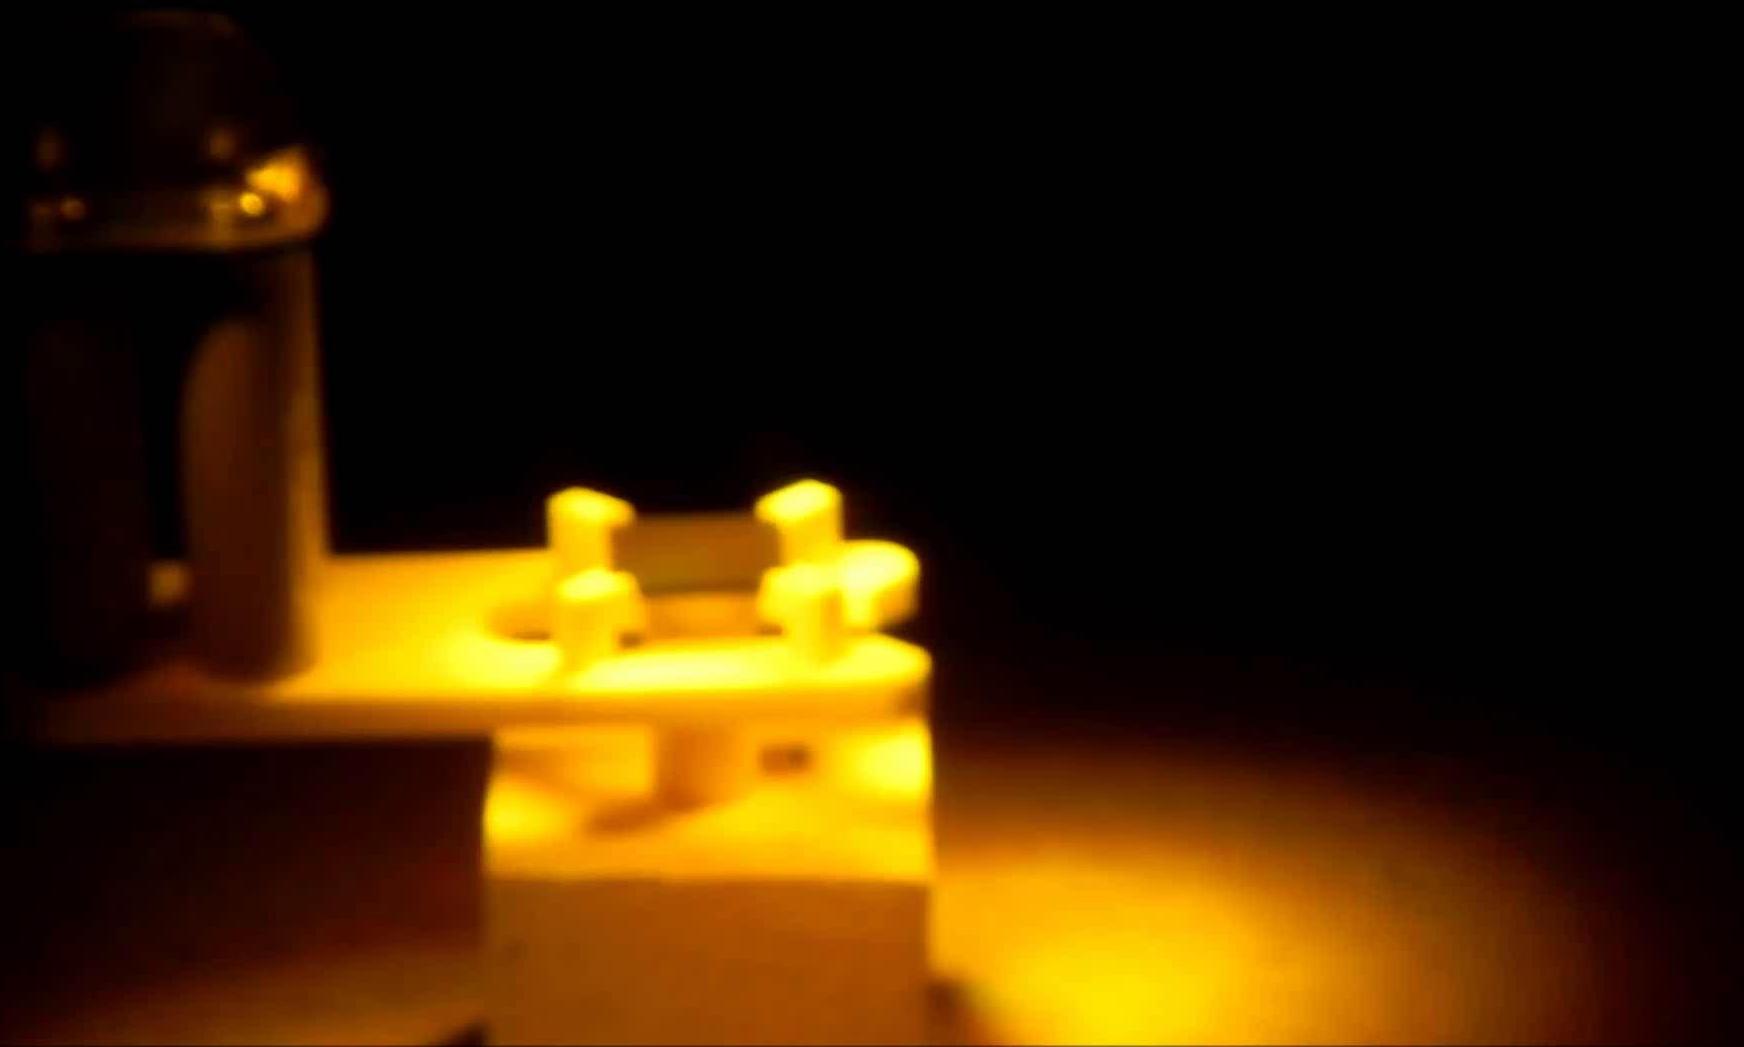

# Sample Results

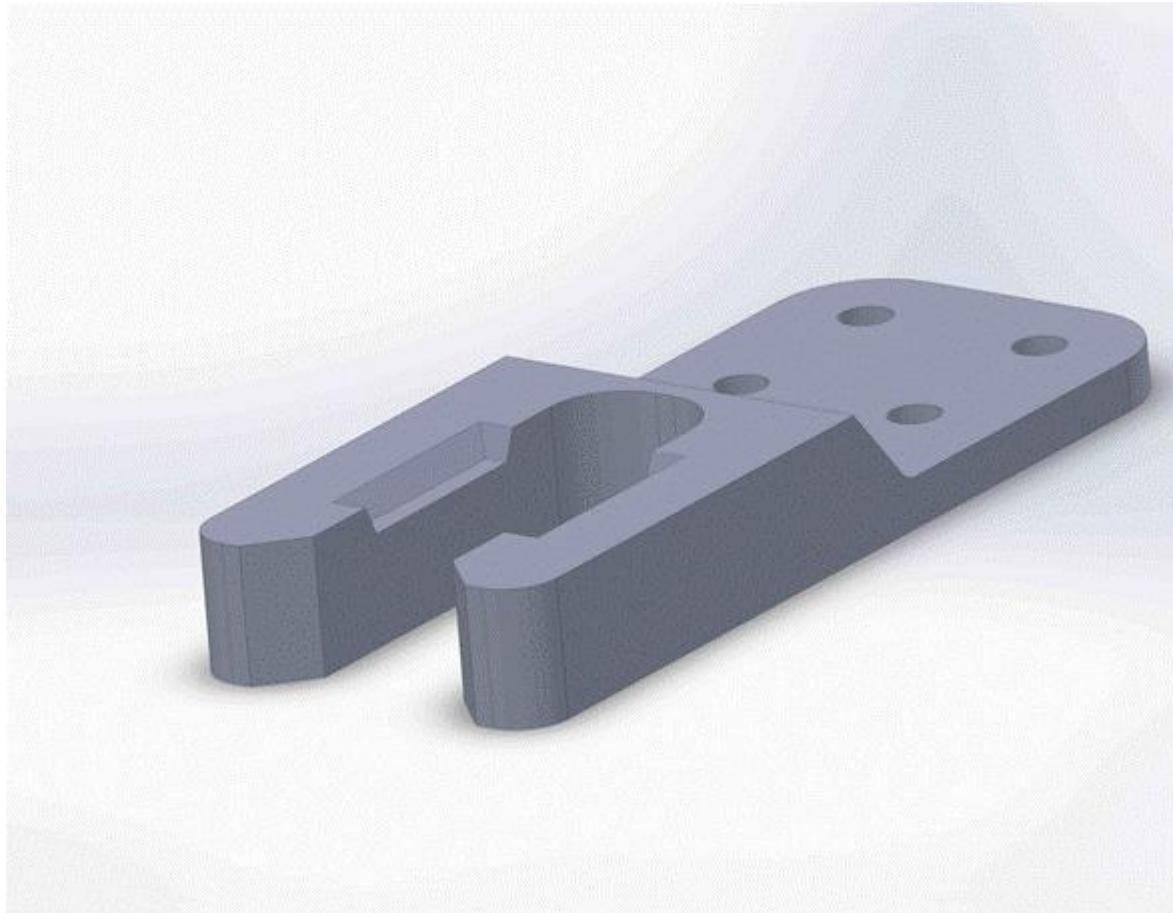

Ambrosini et al. (2016)

# ASHES (sticking problem)

# New End Effector

# Overview

- Introduction
- High-Flux Solar Simulator Design
- Automated Sample Handling & Exposure System

- Conclusions

# Conclusions

- Designed and constructed high-flux solar simulator with Automated Sample Handling & Exposure System (ASHES)
- Performance specifications
  - $7.2 \text{ kW}_e$ ,  $\sim 6 \text{ kW}_{\text{radiative}}$
  - Peak irradiance of  $\sim 1,100$  suns
  - Average irradiance 900 suns
  - Spot size  $\sim 25.4$  mm
  - Multiple samples exposed sequentially using robotic arm
    - Prescribed exposure duration or max temperature at prescribed flux
    - Continuous operation

# ASHES Available for Use

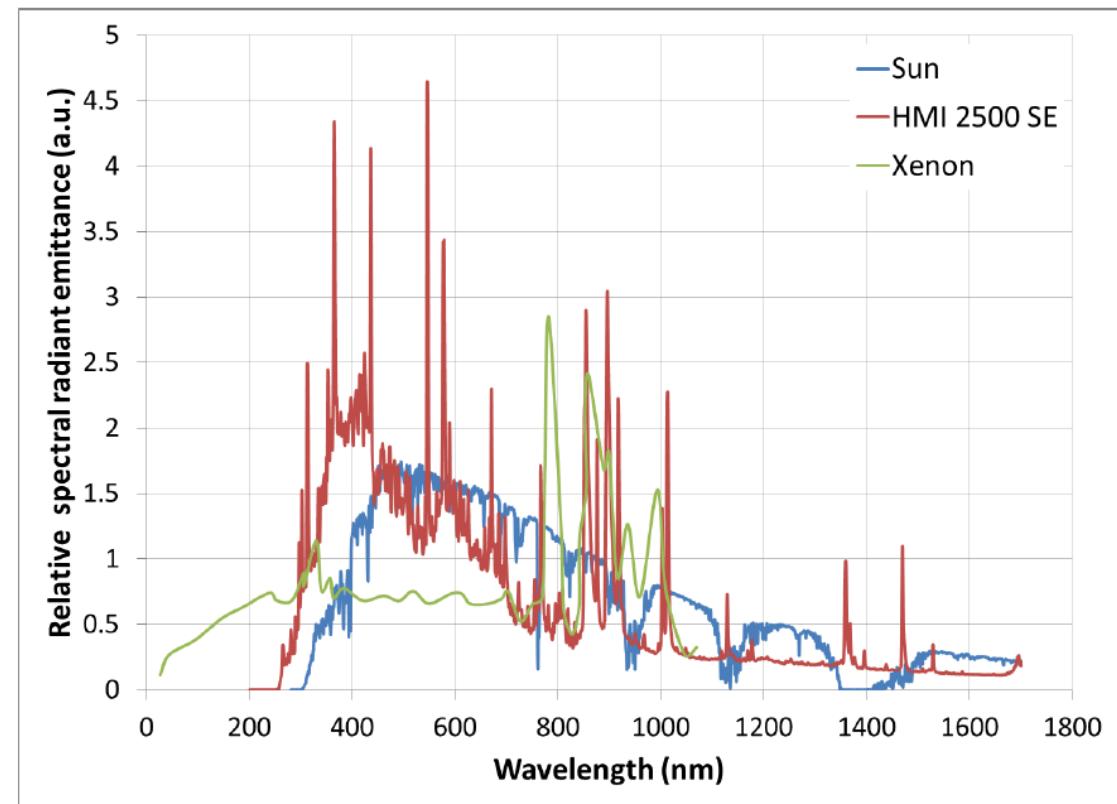

- ASHES @ National Solar Thermal Test Facility
  - Strategic Partnership Projects Agreement
  - Contact Cliff Ho ([ckho@sandia.gov](mailto:ckho@sandia.gov)) or Bill Kolb ([wjkolb@sandia.gov](mailto:wjkolb@sandia.gov))

# BACKUP SLIDES

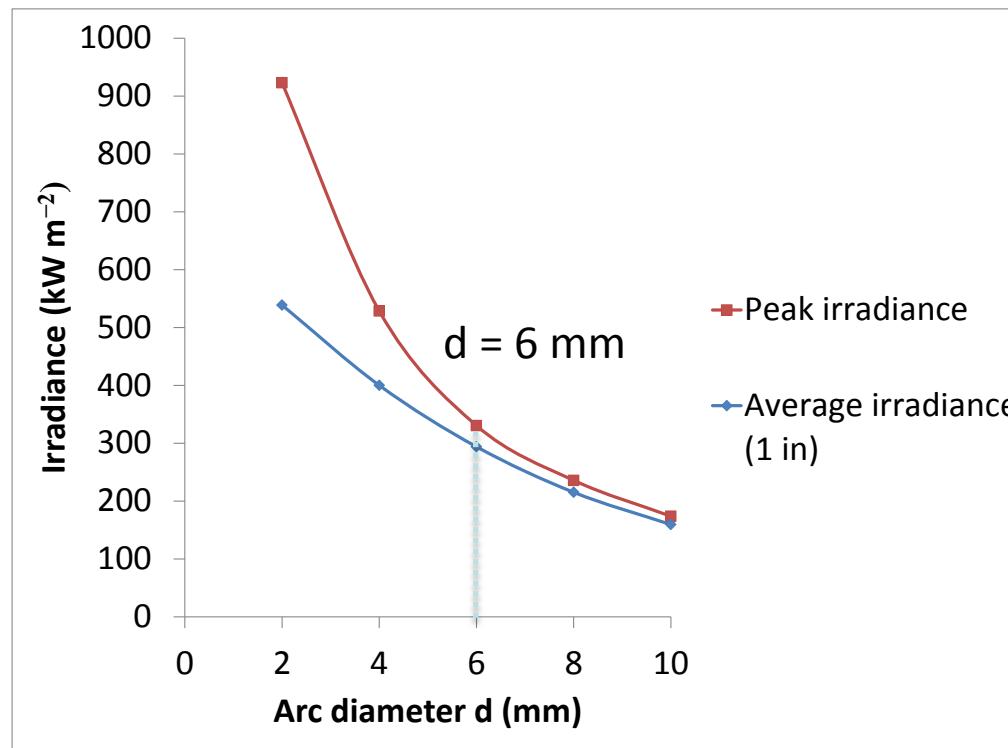

# Xenon vs. Metal Halide Lamps

- Xenon lamps have smaller arc lengths
  - Higher concentration
- Longer lifetime
- 10X more expensive

# Modeling and Design

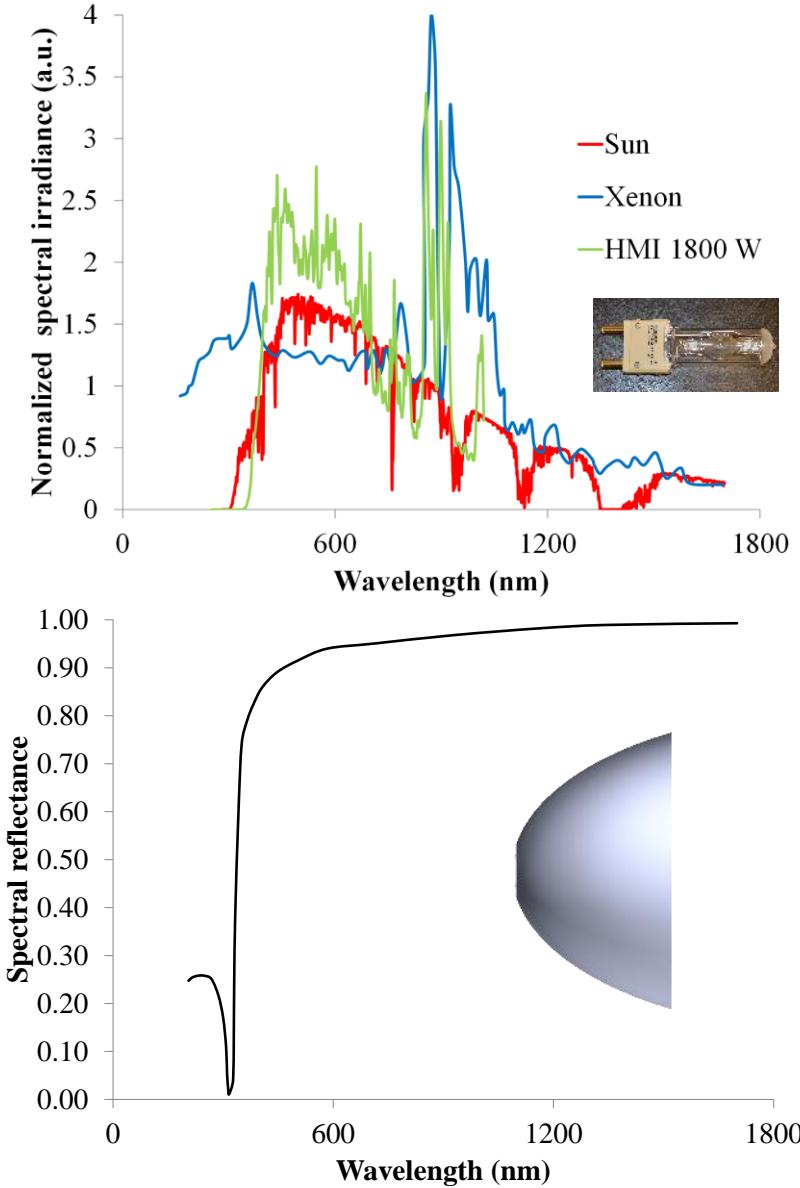

- Influence of arc geometry and size
  - Light source modeled by a cylinder

# Modeling and Design

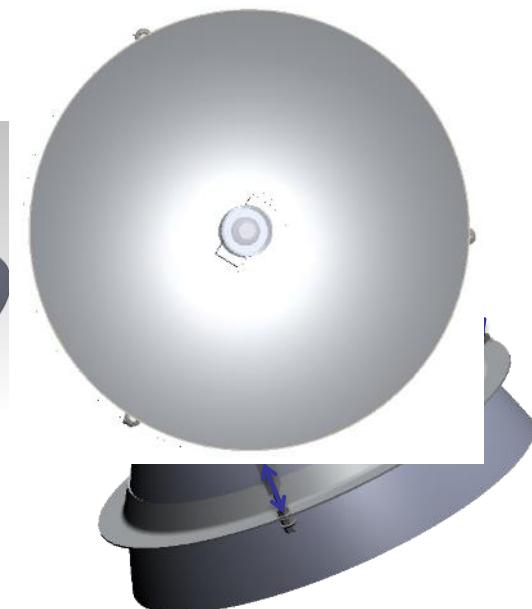

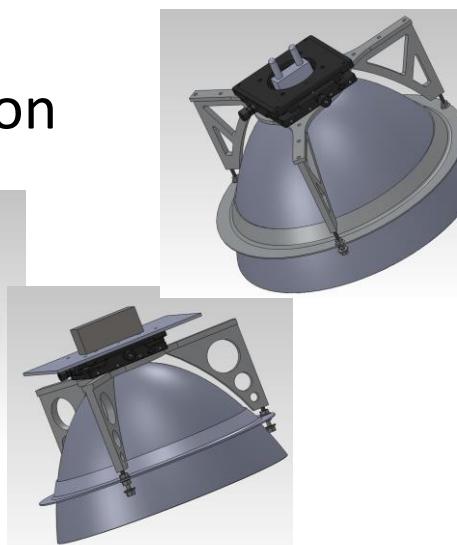

Boubault et al. (2015)

- Metal halide lamps match the solar spectrum better
- HMI 1800 W (efficiency = 0.86 or 1550 W emitted)
- Electroformed silver-coated nickel reflectors
- Total specular reflectance = 0.875

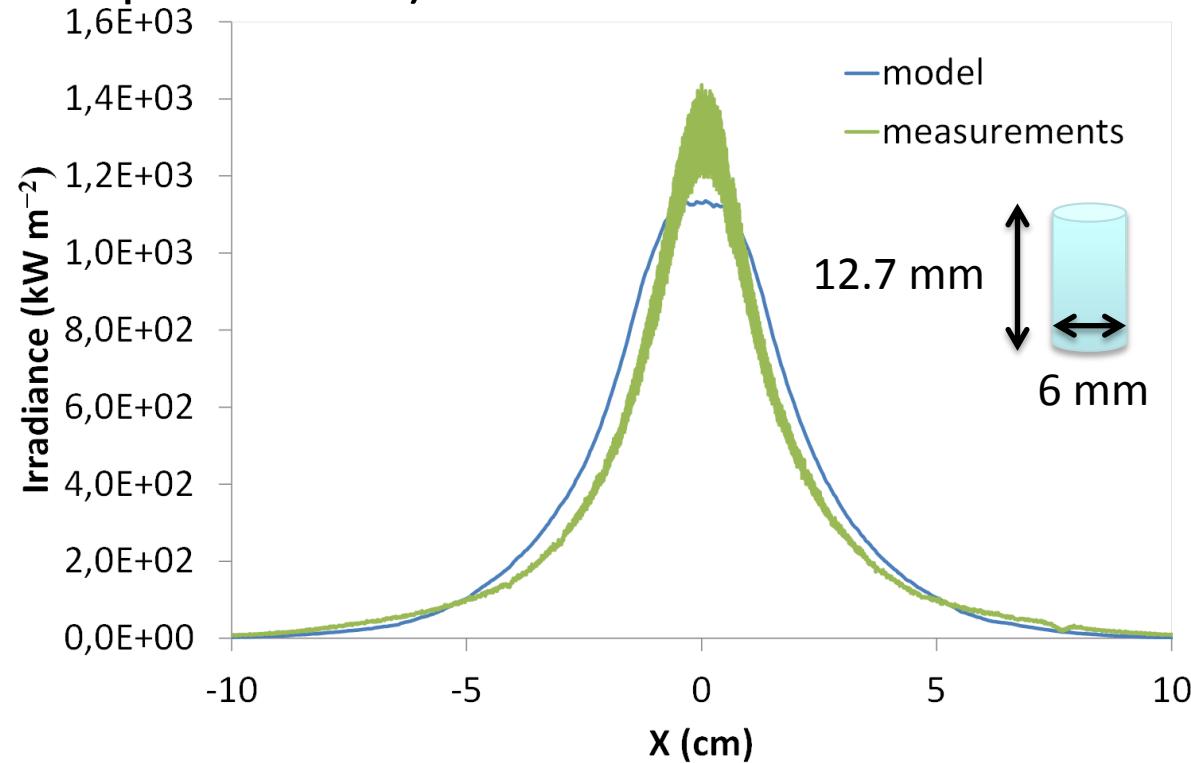

# Construction

- Vertical design
  - easier positioning of samples
  - symmetric relative to gravity
  - safer (mitigate exposure risk)
- Holding system optimization

# Characterization

- 4 lamps (simulated + experimental)

# ASHES Design
