CM4 summer school, Stanford, June 21<sup>st</sup>

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

# Outline

- Why we need to couple different models
- Brief introduction of classic Schwarz methods
- PNP and cDFT equations for electrostatics
- Some facts about nonlocal models
- Coupling PNP-cDFT with Schwarz
- Optimization-based coupling
- Nonlocal Poisson equation as a proxy for Peridynamics
- Coupling of local and nonlocal Poisson equations

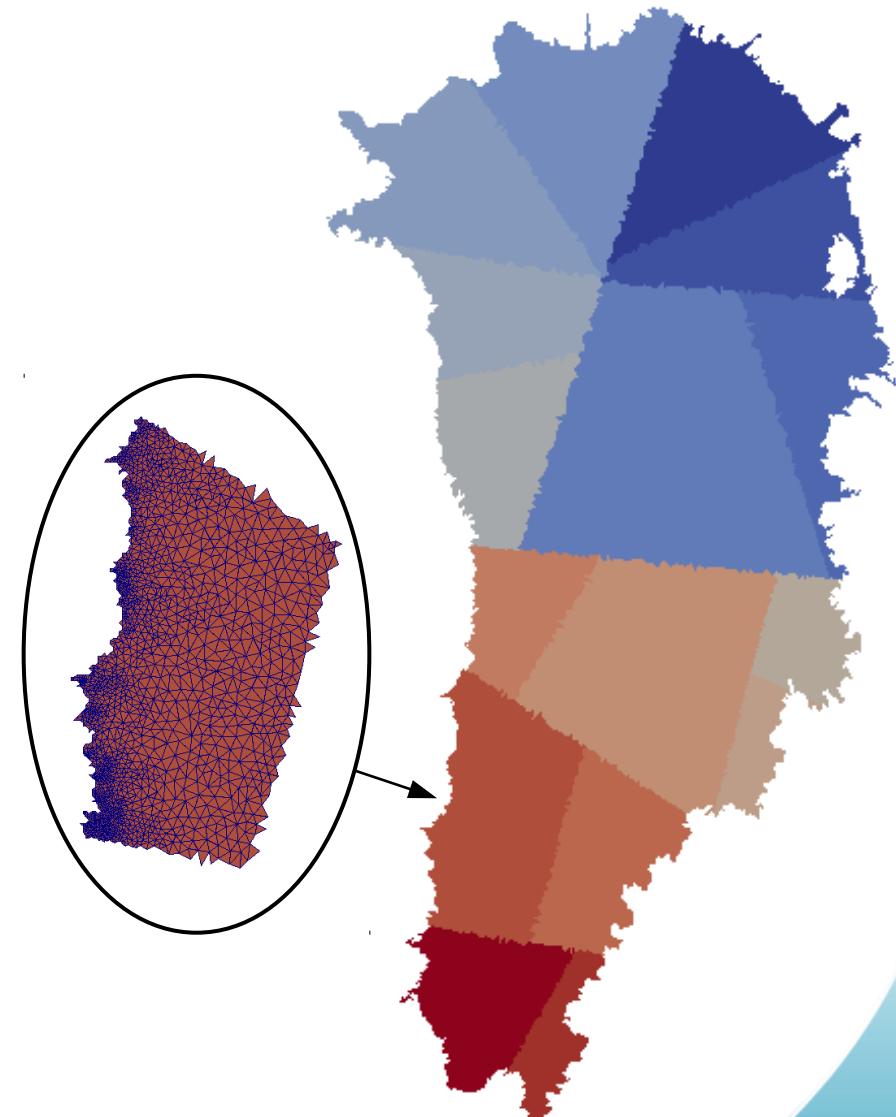

## Hands-on sessions (with Kyungjoo Kim):

- Schwarz and Optimization-based couplings of local and nonlocal Poisson equations

# Why we need coupling techniques

## Example1: Domain Decomposition (same model, multiple domains)

- Problem restricted to each subdomain is smaller and requires less resources (memory and CPU).
- Iterative parallel solution: problem on subdomains can be solved independently and then at each iteration values at the interfaces are “communicated” to neighbor domains.
- Problem can be solved in parallel over multiple processes.
- Domain Decomposition methods are often used to create preconditioners for iterative solvers.

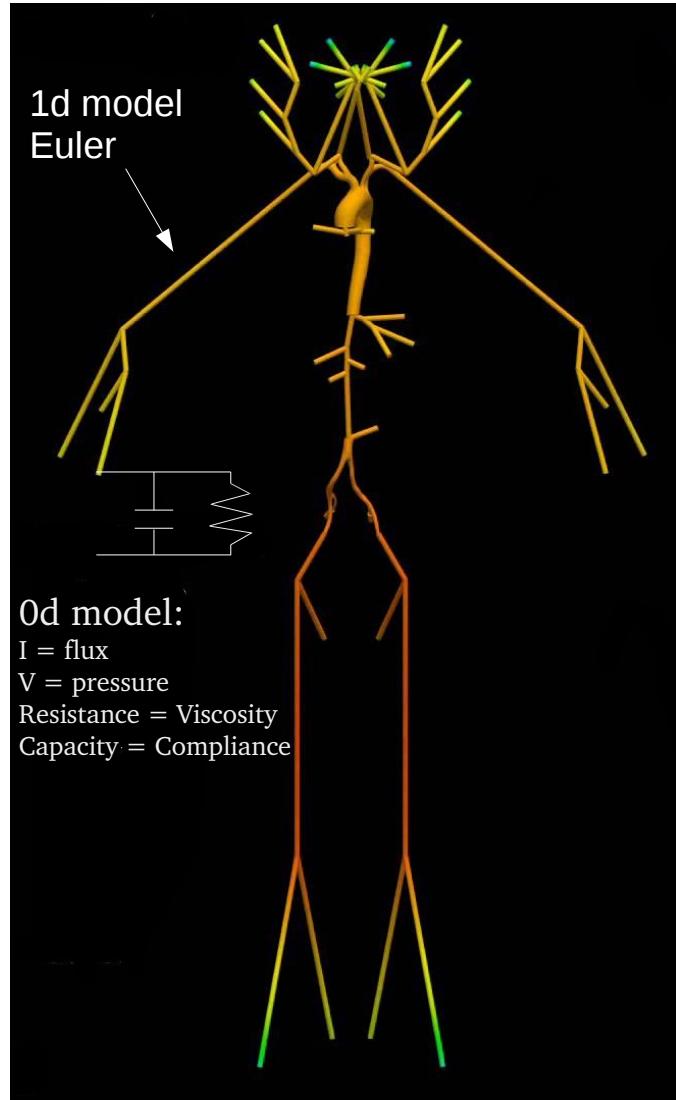

Typical interface conditions for Poisson-like problems:

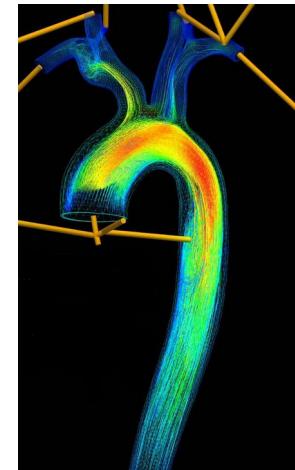

1. Continuity of solution
2. Continuity of solution derivative normal to the surface

# Why we need coupling techniques

## Example2: Modeling systemic circulation (geometric multiscale\*)

**Aorta, 3D model:**  
Navier-Stokes

How to couple NS (aorta)  
With 1D Euler (other vessels)?

And what about  
Fluid-Structure Interaction?

How to couple NS (large vessel)  
with Darcy (porous media)?

NS: vector equation.  
Darcy: scalar equation.

**Liver, 3D model:**  
Darcy flow

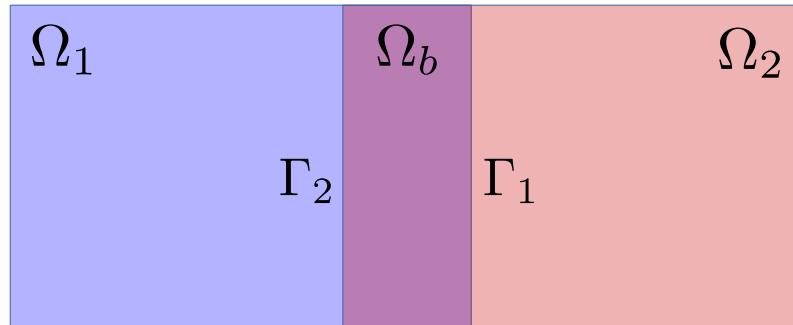

Simulations by Cristiano Malossi (CMCS), LifeV

# Alternating Schwarz methods

# Alternating Schwarz Method

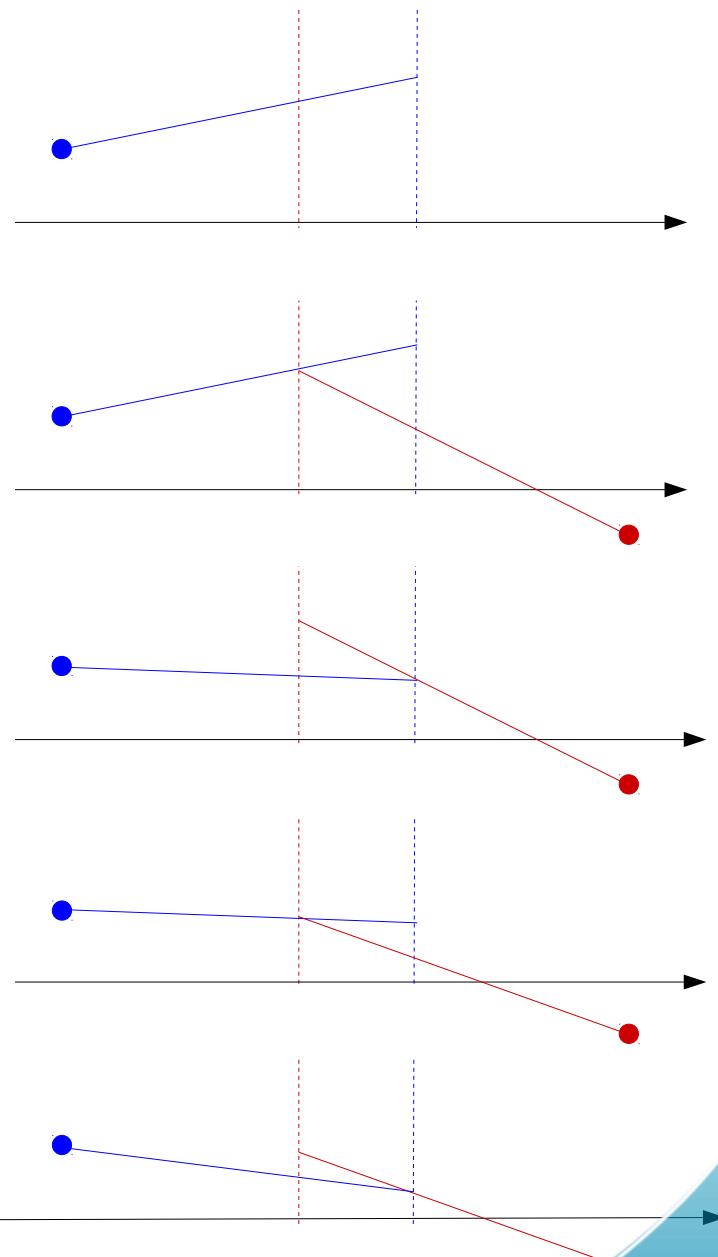

Laplace problem:  $\begin{cases} -\Delta u = 0 & \text{in } \Omega \\ \text{proper b.c.} & \text{on } \partial\Omega \end{cases}$

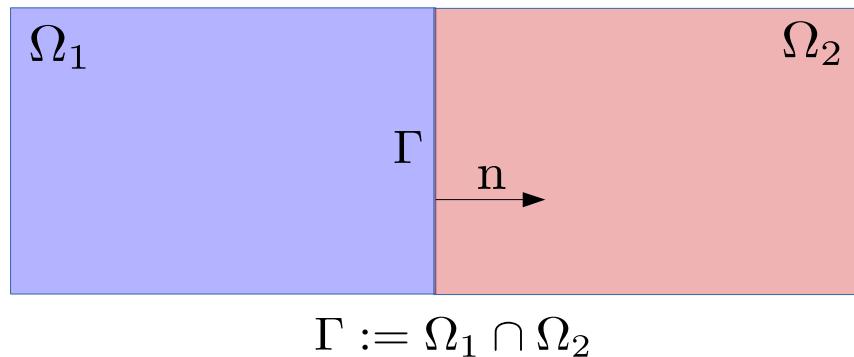

$$\Omega_b := \Omega_1 \cap \Omega_2, \quad \Omega := \Omega_1 \cup \Omega_2$$

$$\begin{cases} -\Delta u_1^{k+1} = 0 & \text{in } \Omega_1 \\ u_1^{k+1} = u_2^k & \text{on } \Gamma_1 \\ \text{other b.c.} & \end{cases} \quad \begin{cases} -\Delta u_2^{k+1} = 0 & \text{in } \Omega_2 \\ u_2^{k+1} = u_1^{k+1} & \text{on } \Gamma_2 \\ \text{other b.c.} & \end{cases}$$

- Converges with elliptic operators
- Rate of convergence depends on the size of the overlap
- Overlap needed for convergence

# (Nonoverlapping) Coupling Methods

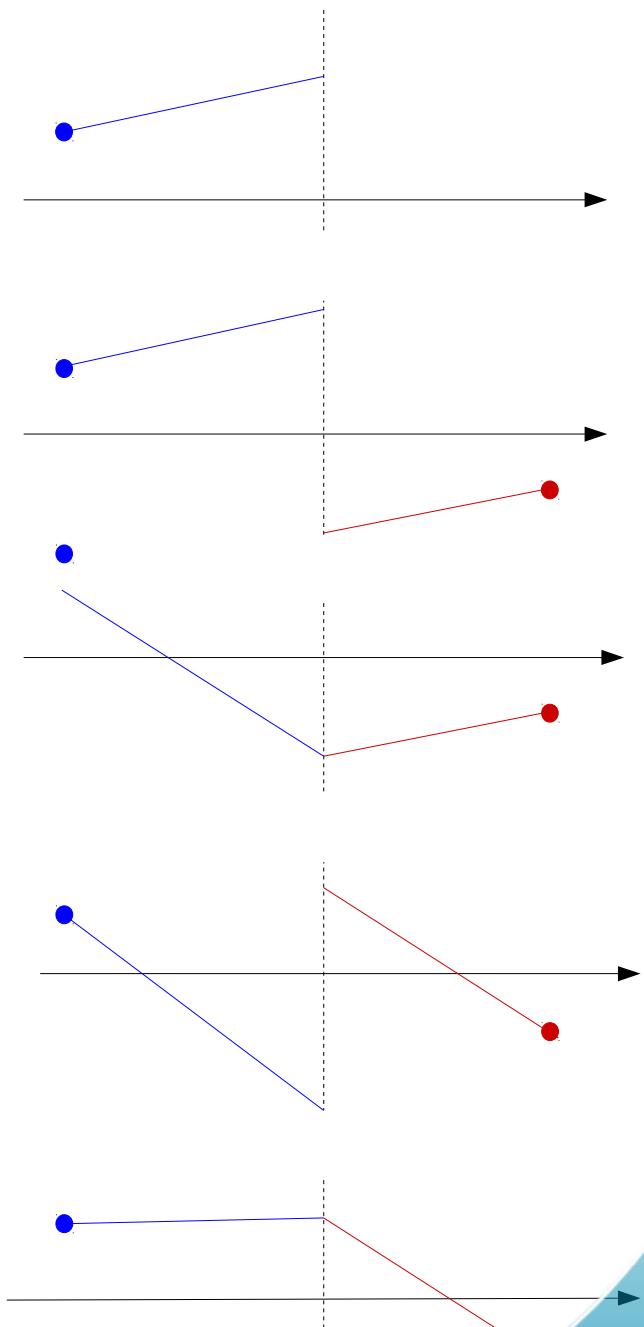

Dirichlet-Neumann methods

$$\begin{cases} \begin{aligned} -\Delta u_1^{k+1} &= 0 && \text{in } \Omega_1 \\ u_1^{k+1} &= u_2^k && \text{on } \Gamma_1 \\ \text{other b.c.} & && \end{aligned} \end{cases} \quad \begin{cases} \begin{aligned} -\Delta u_2^{k+1} &= 0 && \text{in } \Omega_2 \\ \partial_n u_2^{k+1} &= \partial_n u_1^{k+1} && \text{on } \Gamma_2 \\ \text{other b.c.} & && \end{aligned} \end{cases}$$

Robin-Robin methods

$$\begin{cases} \begin{aligned} -\Delta u_1^{k+1} &= 0 && \text{in } \Omega_1 \\ \alpha_1 u_1^{k+1} + \partial_n u_1^{k+1} &= \alpha_1 u_2^k + \partial_n u_2^{k+1} && \text{on } \Gamma_1 \\ \text{other b.c.} & && \end{aligned} \end{cases}$$

$$\begin{cases} \begin{aligned} -\Delta u_2^{k+1} &= 0 && \text{in } \Omega_2 \\ \alpha_2 u_2^{k+1} + \partial_n u_2^{k+1} &= \alpha_2 u_1^{k+1} + \partial_n u_1^{k+1} && \text{on } \Gamma_2 \\ \text{other b.c.} & && \end{aligned} \end{cases}$$

We can select  $\alpha_1$  and  $\alpha_2$  to improve convergence:

- M. Gander, Optimized Schwarz Methods, SIAM J. Numer. Anal., 2006

# Poisson-Nerst-Planck and classic Density Functional Theory

# Poisson-Nernst-Planck (PNP) equations

**Poisson** equation for electric potential

$$\operatorname{div}(-\epsilon \nabla \phi) = q$$

$\phi$  : electric potential  
 $q$  : charge density  
 $\epsilon$  : dielectric constant

**Nernst Planck** equation for each ion type

$$\frac{\partial \rho_\alpha}{\partial t} + \operatorname{div}(\Phi_\alpha) = 0$$
$$\Phi_\alpha := \rho_\alpha \mathbf{v} - D_\alpha \nabla \rho_\alpha - \frac{D_\alpha e z_\alpha}{kT} \rho_\alpha \nabla \phi$$
$$q := e \sum_\alpha \rho_\alpha z_\alpha$$

$\rho_\alpha$  : density of ion  $\alpha$   
 $D_\alpha$  : diffusion constant for ion  $\alpha$   
 $\Phi_\alpha$  : ion flux  
 $z_\alpha$  : valence of ion  $\alpha$ , values:  $\pm 1, \pm 2, \dots$   
 $T$  : temperature  
 $e$  : electron charge  
 $K$  : Boltzmann gas constant

**Boundary and initial conditions:**

Poisson:  $\phi = \phi^{\text{bd}}$ , or  $-\epsilon \frac{\partial \phi}{\partial n} = q_\sigma^{\text{bd}}$

Nernst-Planck:  $\rho_\alpha = \rho_\alpha^{\text{bd}}$ , or  $\Phi_\alpha \cdot \mathbf{n} = \Phi_\alpha^{\text{bd}}$

if  $\frac{\partial \rho_\alpha}{\partial t} = 0 \rightarrow$  steady state PNP

if  $\Phi_\alpha = \mathbf{0}$ ,  $\mathbf{v} = \mathbf{0} \rightarrow$  Poisson Boltzmann Approx.

# Classic Density Functional Theory (cDFT)

Equivalently, the ion flux can be expressed in terms of the chemical potential

$$\Phi_\alpha := \rho_\alpha \mathbf{u} - D_\alpha \nabla \rho_\alpha - \frac{D_\alpha e z_\alpha}{kT} \rho_\alpha \nabla \phi = \rho_\alpha \mathbf{u} - D_\alpha \rho_\alpha \nabla \mu_\alpha, \quad \left( \begin{array}{l} \text{Use formula:} \\ \nabla (\ln (\rho_\alpha)) = \frac{1}{\rho_\alpha} \nabla \rho_\alpha \end{array} \right)$$
$$\mu_\alpha = \ln (\rho_\alpha) + \frac{e z_\alpha}{K T} \phi$$

chemical potential

Add terms to the chemical potential that account for ion correlation and finite size

$$\mu_\alpha^{cDFT} = \ln (\rho_\alpha) + \frac{e z_\alpha}{K T} \phi + \left( V + \frac{\partial F^{\text{ex}}}{\partial \rho_\alpha} \right)$$

$$F^{\text{ex}}(\rho) = F^{\text{hs}}(\rho) + F^{\text{corr}}(\rho) + F^{\text{disp}}(\rho)$$

$V$  : external chemical potential  
 $F^{\text{ex}}$  : excess Helmholtz free energy

$F^{\text{hs}}$  : hard-sphere free energy  
 $F^{\text{corr}}$  : second-order charge correlations  
 $F^{\text{disp}}$  : mean-field interactions

The excess Helmholtz free energy terms are **nonlocal** terms:

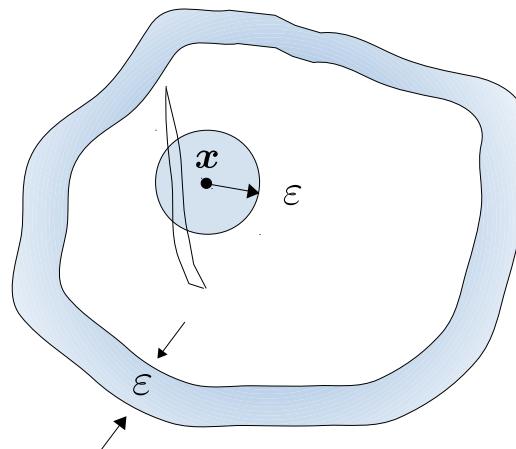

$$\frac{\partial F^{\text{corr}}}{\partial \rho_\alpha} = - \sum_\beta \int_\Omega \rho_\beta(\mathbf{y}) c_{\alpha\beta}(|\mathbf{x} - \mathbf{y}|) d\mathbf{y}$$

# Facts about Nonlocal Models

# Facts about Nonlocal Models

- Nonlocal operators  $\mathcal{L}(u)(x)$  depend on the values of  $u$  in a *finite/infinite* neighbour of  $x$
- Interactions can occur at distance, without contact
- Boundary conditions need to be prescribed on an  $\epsilon$  border of the domain
- Used in many scientific and engineering applications, where the material dynamics depends on microstructure, e.g. nonlocal electrostatic or brittle fracture
- Often, under some regularity assumption, as the horizon  $\epsilon$  goes to zero, or equivalently as we take a macroscopic look at the model, the nonlocal model reduces to a local model

$$\mathcal{L}(u)(x) = \int_{B(x, \epsilon)} u(y) c(|x - y|) dy$$

— Q. Du, M.D. Gunzburger, R. Lehoucq, and K. Zhou, Analysis and approximation of nonlocal diffusion problems with volume constraints. *SIAM Review*, 2012

# Comparison of Local and Nonlocal discretizations

Local operator

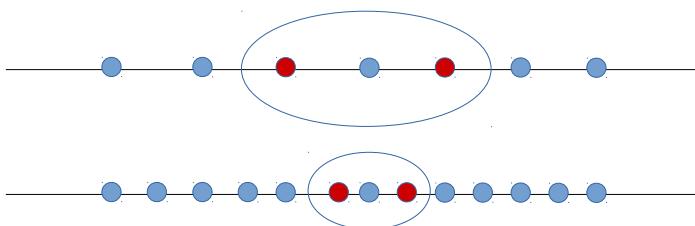

$$\frac{du}{dx} \Big|_x$$

Depends on the values that  $u$  takes in an *infinitesimum* neighbour of  $\mathbf{x}$

Simple discretization:

$$\left| \frac{du}{dx} \right|_{x_i} \approx \frac{u(x_{i+1}) - u(x_{i-1})}{x_{i+1} - x_{i-1}}$$

#evaluations: 2 (in one dimension)

#evaluations:  $2d$  (in  $d$  dimensions, gradient)

Nonzeros of discretization matrices grow **linearly** with the number of points, or as  $h^{-d}$ .

Nonocal operator

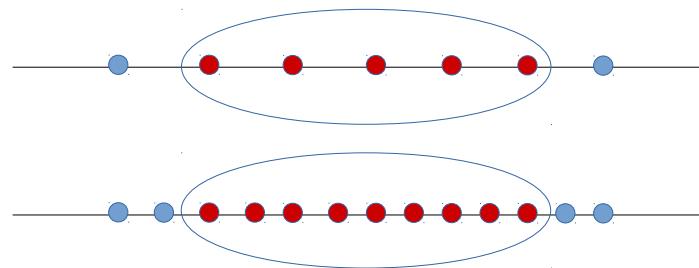

$$\int_{B(x, \varepsilon)} u(y) c(|x - y|) dy$$

Depends on the values that  $u$  takes in a *finite/infinite* neighbour of  $\mathbf{x}$

Simple discretization:

$$\sum_{|x_j - x_i| < \varepsilon} u(x_j) c(|x_j - x_i|) w_j^h$$

# evaluations:  $\approx 2 \frac{\varepsilon}{h}$  (in one dimension)

# evaluations:  $\approx V_{\mathcal{B}(0,1)} \frac{\varepsilon^d}{h^d}$  (in  $d$  dimensions)

Nonzeros of discretization matrices grow as the **square** of the number of unknowns, or as  $h^{-2d}$ .

unknowns

# PNP-cDFT Coupling

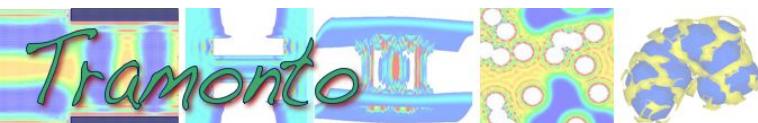

(membrane  
attracts anions,  
repels cations)

Hybrid solution:

Convergence:

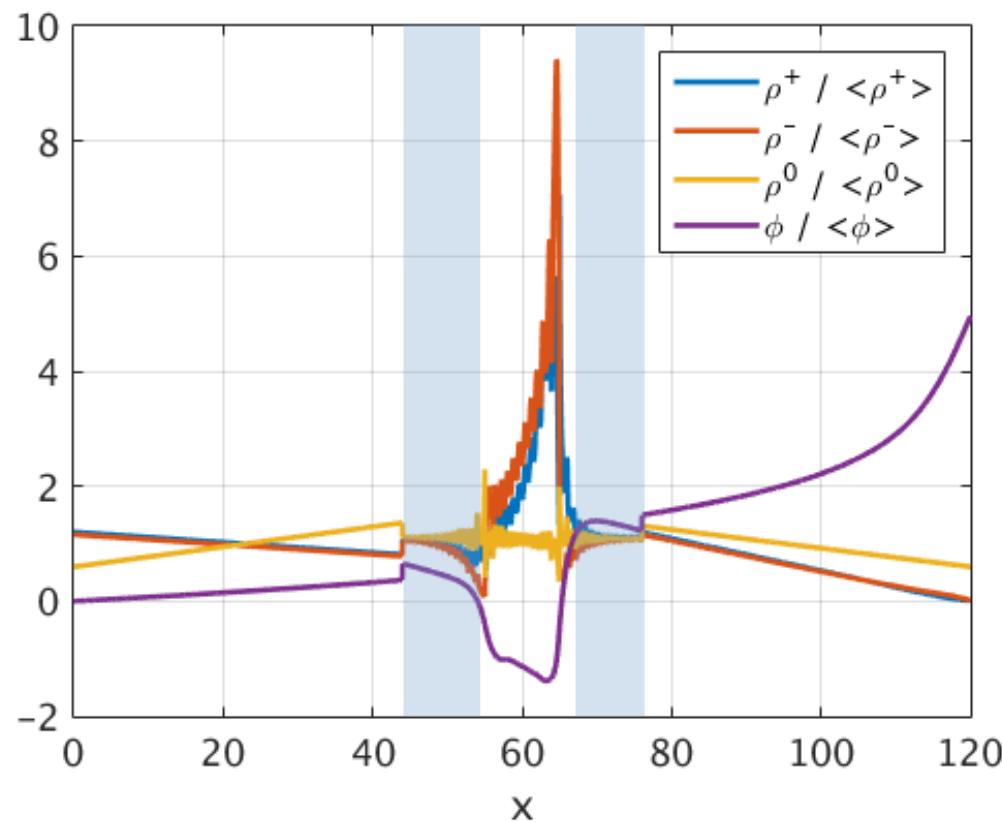

- about 4 iterations converges in “eyeball norm”
- 10 iterations for increment to be less than 1e-4 in L2 norm
- initializing the problem with PNP solved everywhere increases significantly the convergence.

L J Douglas Frink, A Thompson, and A G Salinger. Applying molecular theory to steady-state diffusing systems. *J Chem Phys*, 2000

# PNP-cDFT Coupling

What if we move the overlap region close to the membrane?

- Method is not converging.
- DFT solution is oscillatory next to the membrane and the Dirichlet condition passed to PNP can vary significantly at each iteration

- This is a possible issue with Shwartz coupling. In the following we will present a coupling method that, in principle, should not suffer from this issue.

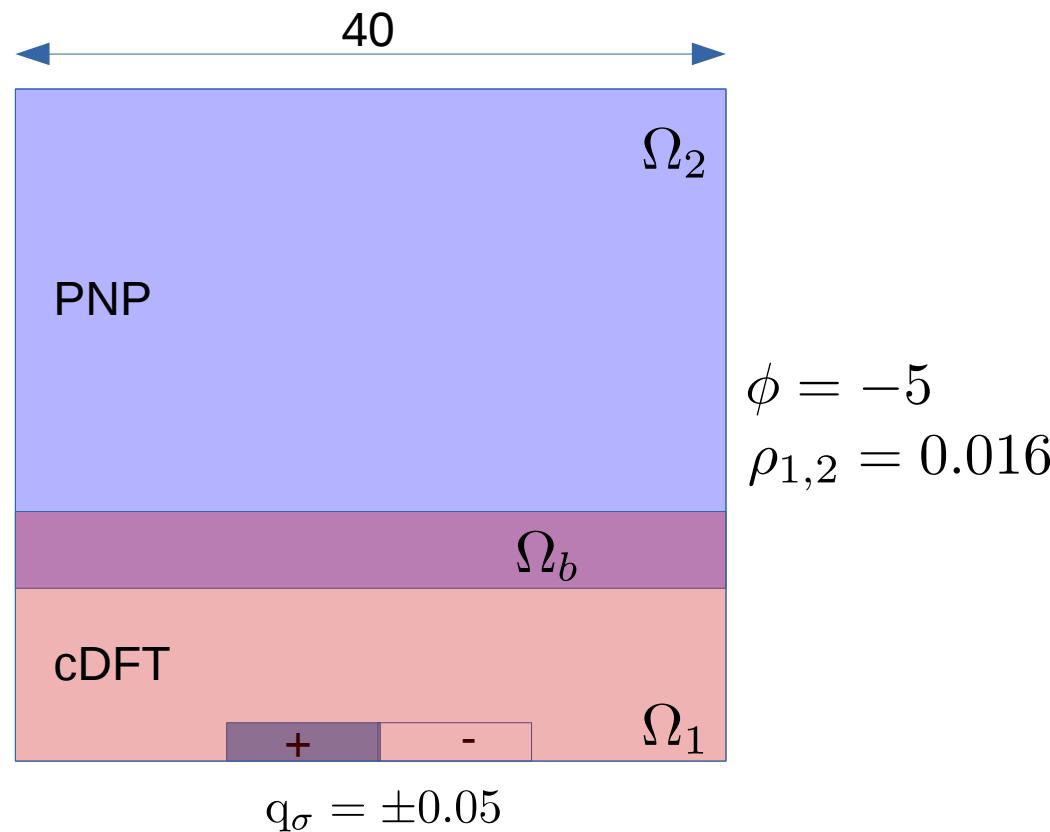

# PNP-cDFT Coupling

2D problem with two monovalent ions:

$$r_1 = 2, \quad r_2 = 1$$

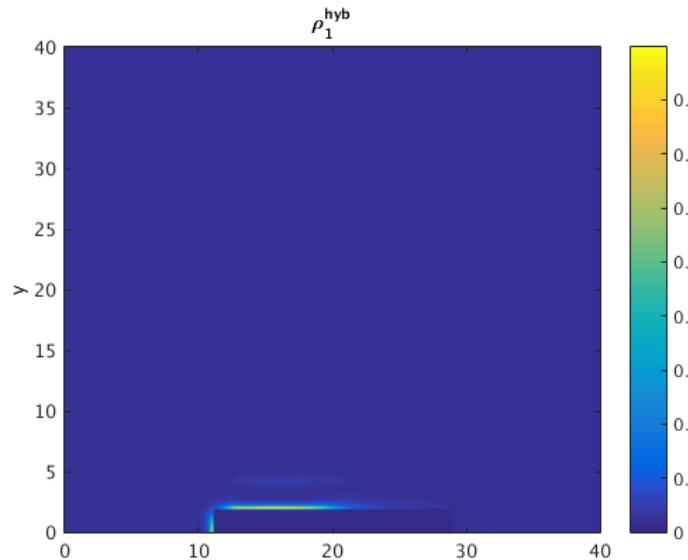

$$z_1 = 1, \quad z_2 = -1$$

$$\phi = 5$$
$$\rho_{1,2} = 0.016$$

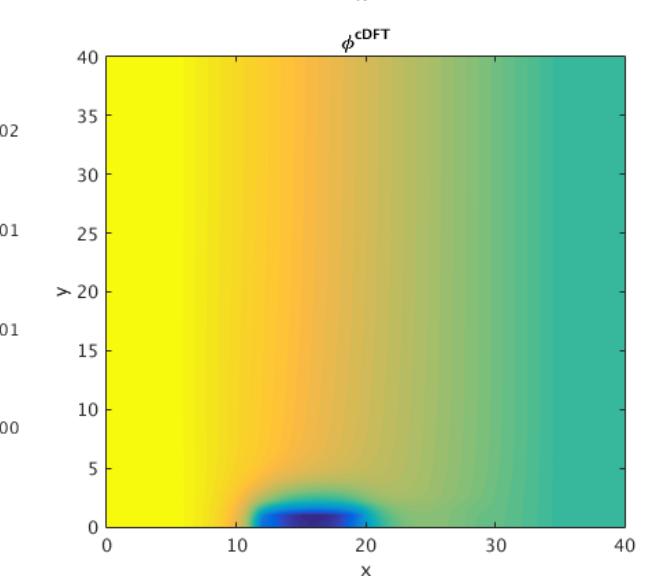

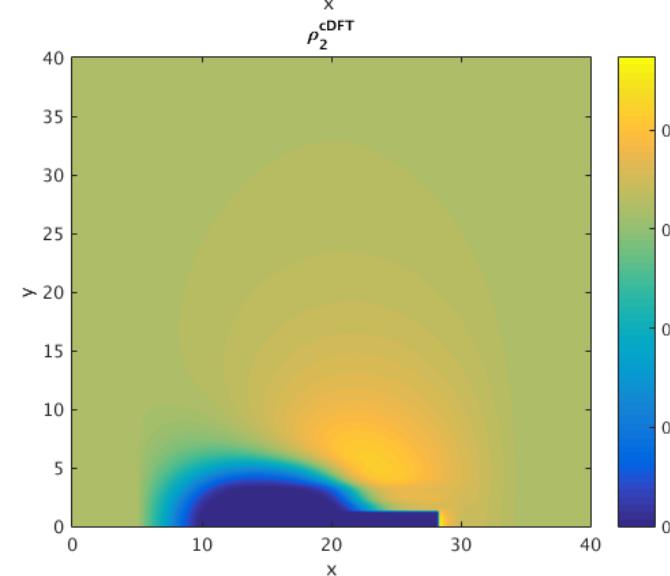

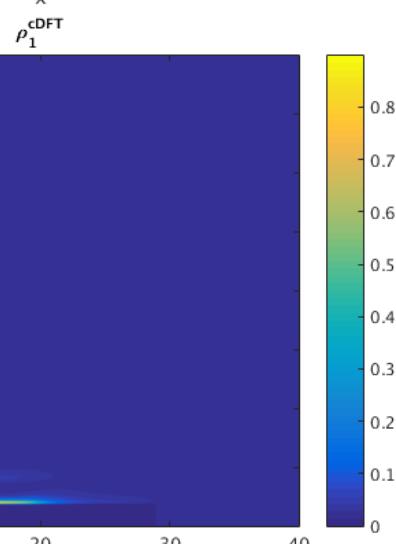

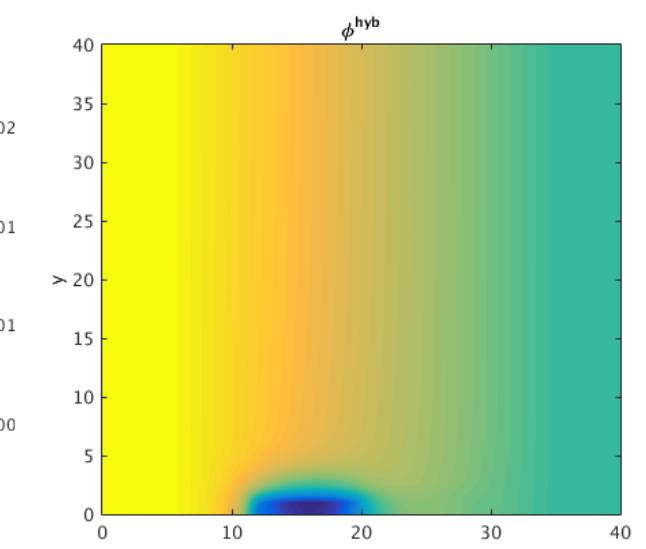

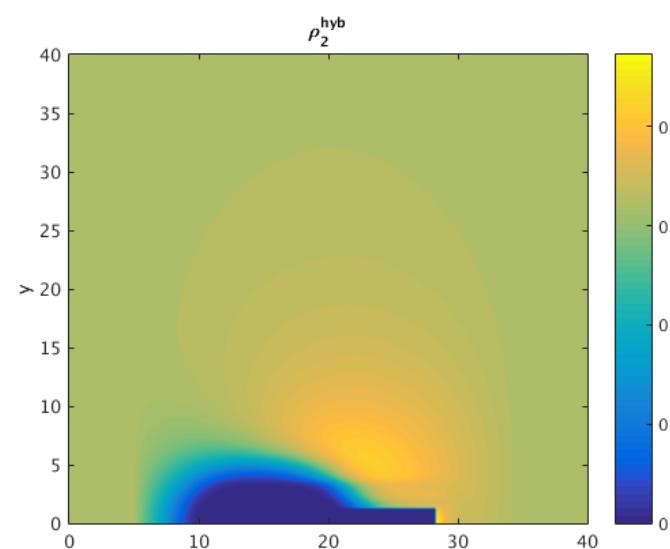

# PNP-cDFT Coupling

Hybrid (PNP-cDFT) solution

Hybrid vs. cDFT: 2x speedup, 0.4x memory usage

Full cDFT solution

# Optimization-based Coupling

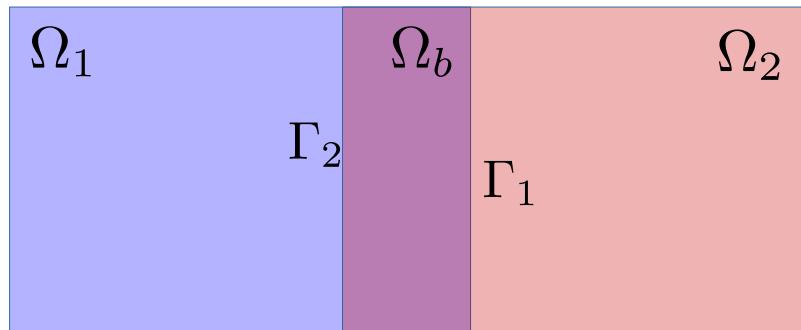

Work by P. Bochev, M. D'Elia, M. Perego, D. Littlewood

# Optimization-based Coupling

Research approach: optimization-based coupling:

- Traditional coupling:
  - **Solve the models subject to coupling constraints**
- Optimization coupling reverses the roles:
  - **Minimize coupling error subject to the models**

$$\min_{\mathbf{u}_1, \mathbf{u}_2, \boldsymbol{\theta}_1, \boldsymbol{\theta}_2} J(\mathbf{u}_1, \mathbf{u}_2) = \frac{1}{2} \int_{\Omega_b} |\mathbf{u}_1 - \mathbf{u}_2|^2 \, dx = \frac{1}{2} \|\mathbf{u}_1 - \mathbf{u}_2\|_{0, \Omega_b}^2$$

s.t.

$$\begin{cases} \mathcal{L}_1(\mathbf{u}_1) = 0 & \text{in } \Omega_1 \\ \mathbf{u}_1 = \boldsymbol{\theta}_1 & \text{on } \Gamma_1 \\ \text{other b.c.} & \end{cases} \quad \begin{cases} \mathcal{L}_2(\mathbf{u}_2) = 0 & \text{in } \Omega_1 \\ \mathbf{u}_2 = \boldsymbol{\theta}_2 & \text{on } \Gamma_2 \\ \text{other b.c.} & \end{cases}$$

Control variables

# Optimization-based Coupling

## Pros:

- **extremely flexible**
  - Works with **non-matching** grids, **non-coincident** interfaces.
  - Coupled models **need not** to share the same **discretization**, e.g. it can couple **finite elements** and **particle discretizations**.
- Functional to be minimized can be specific of applications, e.g. could be a **mismatch of fluxes**.
- Control variables can also be chosen in a fairly arbitrary way (e.g. we can **control Neumann conditions**)
- Basic idea **applicable to diverse modeling scenarios**:  
Nonlocal + local electrostatic potential for proteins (CM4), Atomistic-to-continuum coupling.
- Is **provably stable** & admits **rigorous** coupling and discretization **error analysis**.
- At each optimization iteration, models can be **solved separately**. Good for legacy codes.

## Cons:

- It is often more expensive than other coupling strategies
- Requires a fast/robust optimization solver to make the coupling efficient
- Adjoint of the coupled models might be needed to improve convergence

# Model Problems

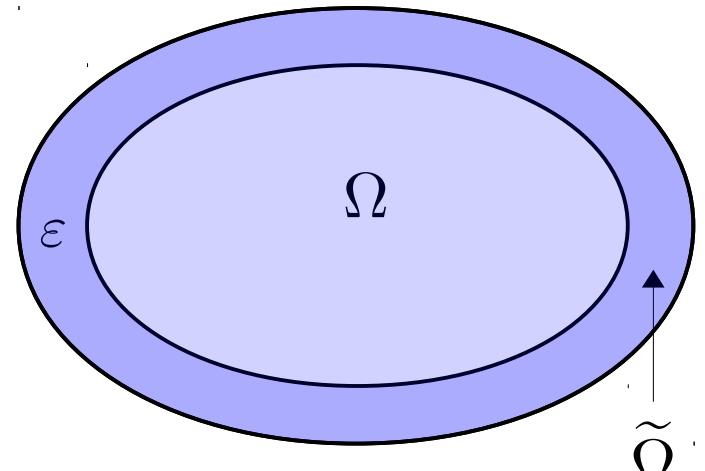

## The nonlocal problem

$$\begin{cases} -\mathcal{L}u_n = f_n & \in \Omega \\ u_n = \sigma_n & \in \tilde{\Omega}, \end{cases}$$

where  $\sigma_n \in \tilde{V}(\tilde{\Omega})$  and  $f_n \in L^2(\Omega)$  and

$$\mathcal{L}(u(\mathbf{x})) := \int_{\mathbb{R}^n} (u(\mathbf{y}) - u(\mathbf{x})) \gamma(\mathbf{x}, \mathbf{y}) d\mathbf{y}.$$

**Kernel** (depends on material properties)

**Kernel:** we assume

$$\begin{cases} \gamma(\mathbf{x}, \mathbf{y}) \geq 0 & \forall \mathbf{y} \in B_\varepsilon(\mathbf{x}) \\ \gamma(\mathbf{x}, \mathbf{y}) = 0 & \forall \mathbf{y} \in \Omega^+ \setminus B_\varepsilon(\mathbf{x}), \end{cases}$$

$$B_\varepsilon(\mathbf{x}) = \{\mathbf{y} \in \Omega^+ : |\mathbf{x} - \mathbf{y}| < \varepsilon, \mathbf{x} \in \Omega\}$$

# Model Problems

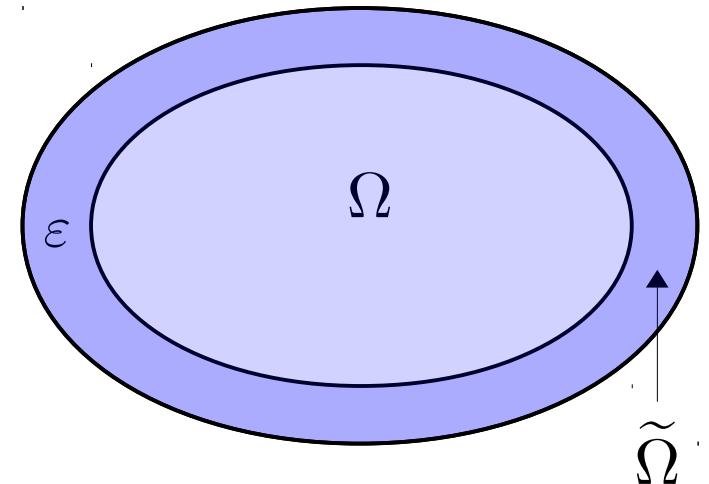

## The nonlocal problem

$$\begin{cases} -\mathcal{L}u_n = f_n & \in \Omega \\ u_n = \sigma_n & \in \tilde{\Omega}, \end{cases}$$

where  $\sigma_n \in \tilde{V}(\tilde{\Omega})$  and  $f_n \in L^2(\Omega)$  and

$$\mathcal{L}(u(\mathbf{x})) := \int_{\mathbb{R}^n} (u(\mathbf{y}) - u(\mathbf{x})) \gamma(\mathbf{x}, \mathbf{y}) d\mathbf{y}.$$

Nonnegative kernel  
(depends on material properties)

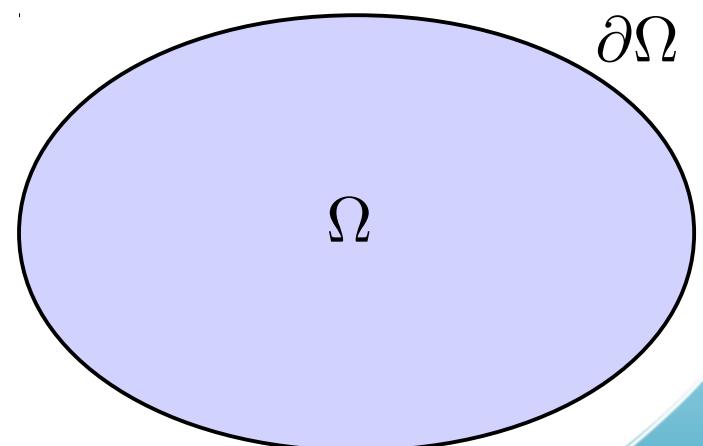

## The local problem

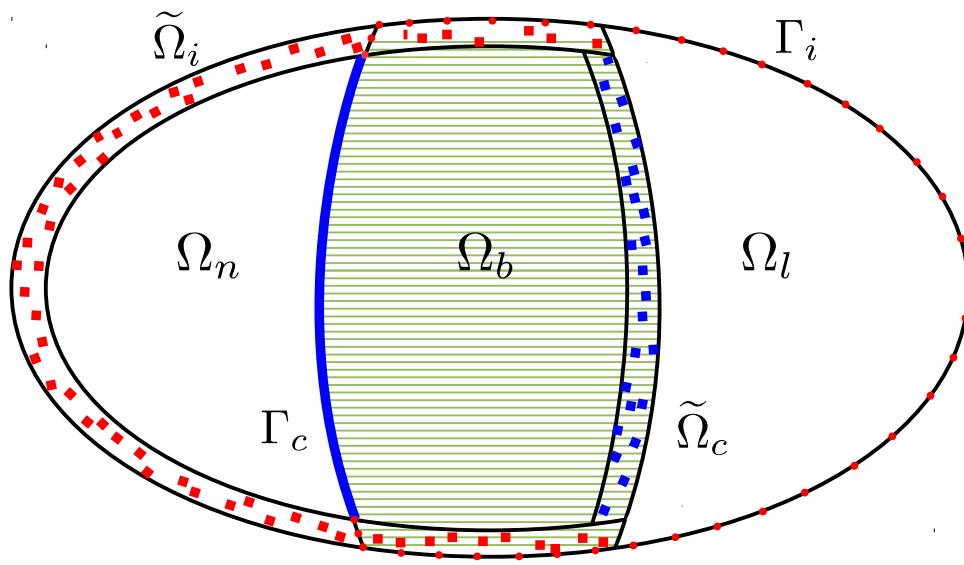

local diffusion model given by the Poisson equation

$$\begin{cases} -\Delta u_l = f_l & \in \Omega \\ u_l = \sigma_l & \in \partial\Omega, \end{cases}$$

where  $\sigma_l \in H^{\frac{1}{2}}(\partial\Omega)$  and  $f_l \in L^2(\Omega)$

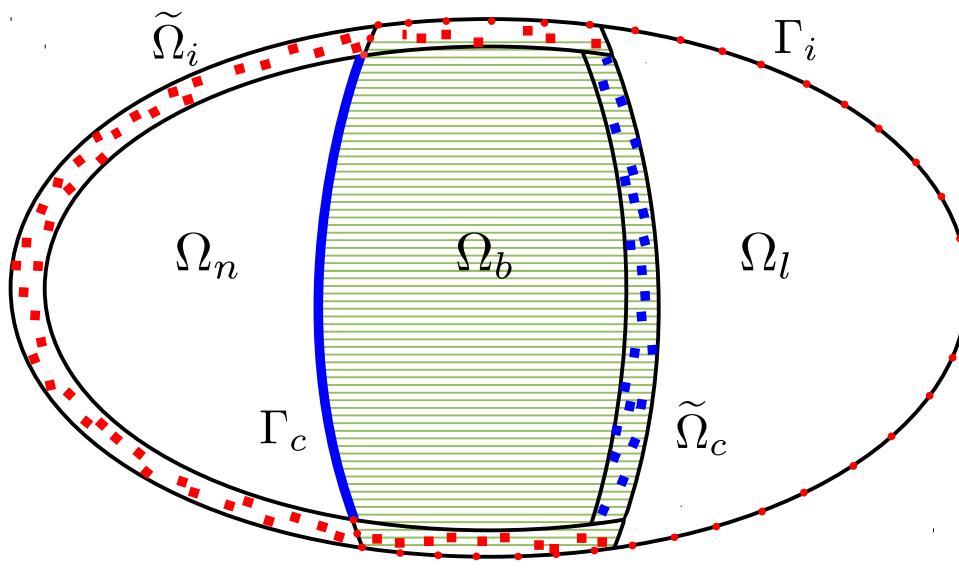

# Local to Nonlocal Coupling

State equations:

$$\begin{cases} -\mathcal{L}u_n = f_n & \mathbf{x} \in \Omega_n \\ u_n = \theta_n & \mathbf{x} \in \tilde{\Omega}_c \\ u_n = 0 & \mathbf{x} \in \tilde{\Omega}_i \end{cases} \quad \begin{cases} -\Delta u_l = f_l & \mathbf{x} \in \Omega_l \\ u_l = \theta_l & \mathbf{x} \in \Gamma_c \\ u_l = 0 & \mathbf{x} \in \Gamma_i. \end{cases}$$

# Local to Nonlocal Coupling

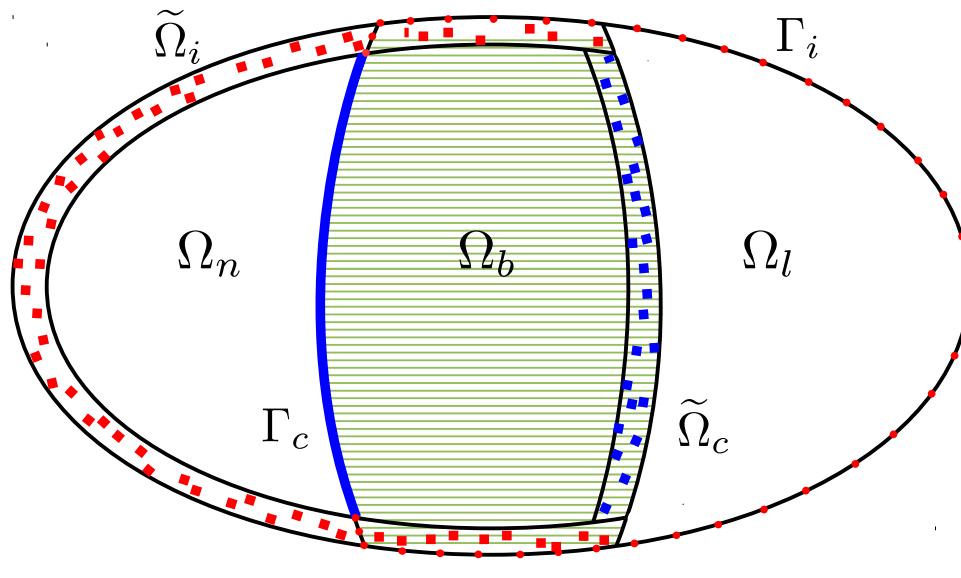

Optimization problem:

$$\min_{u_n, u_l, \theta_n, \theta_l} J(u_n, u_l) = \frac{1}{2} \int_{\Omega_b} (u_n - u_l)^2 \, d\mathbf{x} = \frac{1}{2} \|u_n - u_l\|_{0, \Omega_b}^2$$

s.t. 
$$\begin{cases} -\mathcal{L}u_n &= f_n & \mathbf{x} \in \Omega_n \\ u_n &= \theta_n & \mathbf{x} \in \tilde{\Omega}_c \\ u_n &= 0 & \mathbf{x} \in \tilde{\Omega}_i \end{cases} \quad \begin{cases} -\Delta u_l &= f_l & \mathbf{x} \in \Omega_l \\ u_l &= \theta_l & \mathbf{x} \in \Gamma_c \\ u_l &= 0 & \mathbf{x} \in \Gamma_i. \end{cases}$$

# Local to Nonlocal Coupling

## Optimization problem:

$$\min_{u_n, u_l, \theta_n, \theta_l} J(u_n, u_l) = \frac{1}{2} \int_{\Omega_b} (u_n - u_l)^2 \, d\mathbf{x} = \frac{1}{2} \|u_n - u_l\|_{0, \Omega_b}^2$$

$$\text{s.t. } \begin{cases} -\mathcal{L}u_n &= f_n & \mathbf{x} \in \Omega_n \\ u_n &= \theta_n & \mathbf{x} \in \tilde{\Omega}_c \\ u_n &= 0 & \mathbf{x} \in \tilde{\Omega}_i \end{cases} \quad \begin{cases} -\Delta u_l &= f_l & \mathbf{x} \in \Omega_l \\ u_l &= \theta_l & \mathbf{x} \in \Gamma_c \\ u_l &= 0 & \mathbf{x} \in \Gamma_i. \end{cases}$$

control variables  $(\theta_n, \theta_l) \in \Theta_n \times \Theta_l = \{(\sigma_n, \sigma_l) : \sigma_n \in \tilde{V}_{\tilde{\Omega}_i}(\tilde{\Omega}_c), \sigma_l \in H^{\frac{1}{2}}(\Gamma_c)\}$

# The Algorithm

discretized control variables:  $\theta_{nh}$  and  $\theta_{lh}$

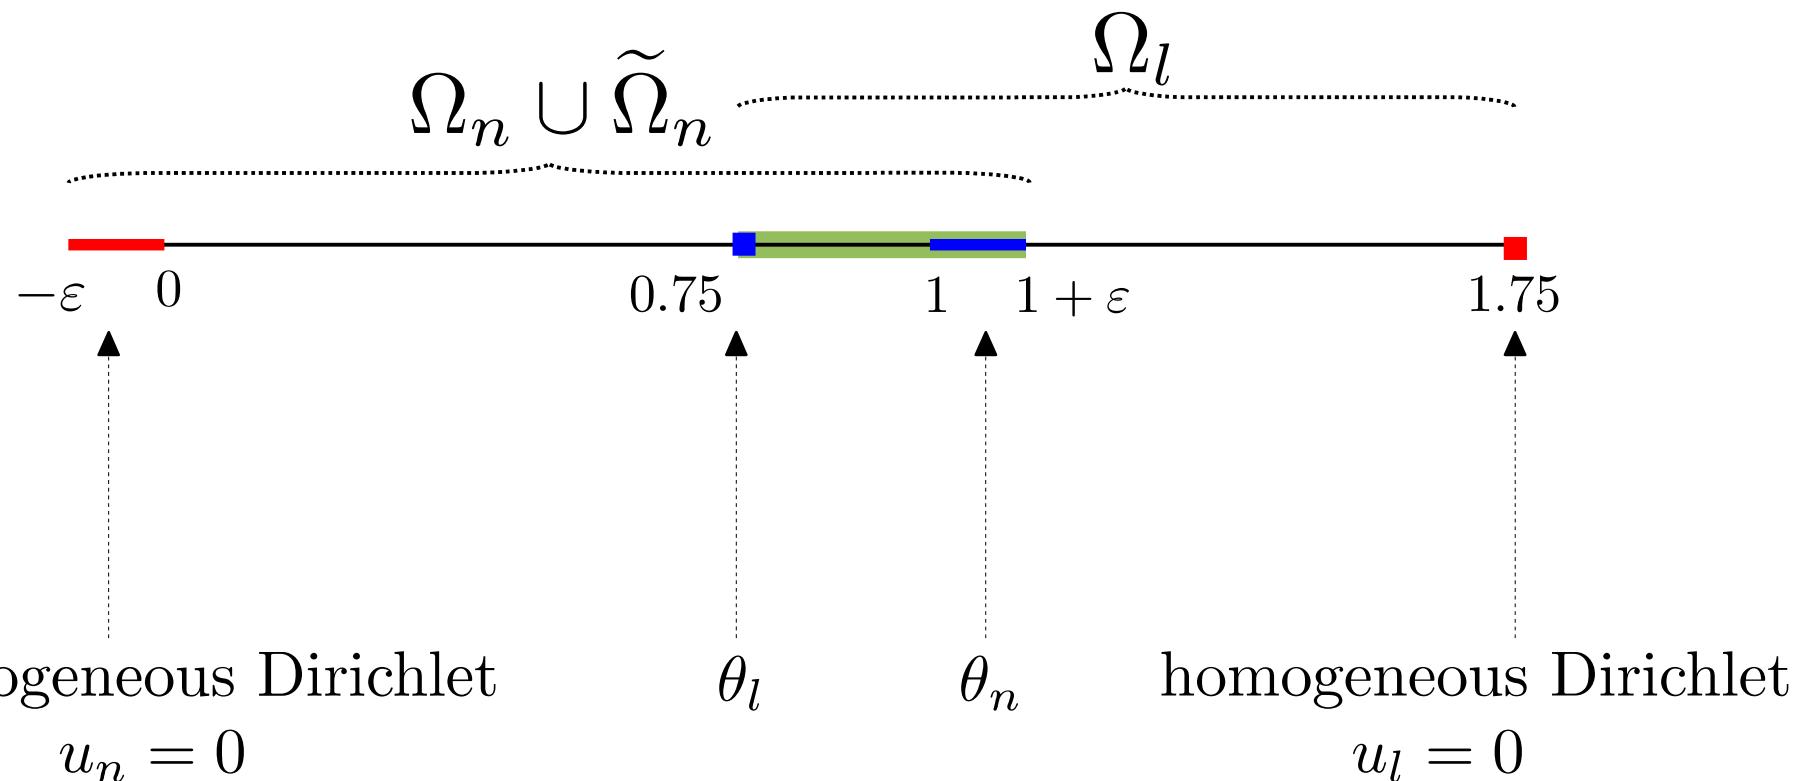

## A gradient-based algorithm

Given an initial guess  $\theta_{nh}^0, \theta_{lh}^0$ , for  $k = 0, 1, 2, \dots$

1. **solve the state** equations and compute  $J_h \rightarrow$  **Independently**
2. **compute the gradient** of the functional and evaluate it  $\frac{dJ_h}{d(\theta_{nh}, \theta_{lh})} \Big|_{(\theta_{nh}^k, \theta_{lh}^k)}$
3. Use 1. and 2. to **compute the increments**  $\delta(\theta_{nh}^k)$  and  $\delta(\theta_{lh}^k) \rightarrow$  **BFGS algorithm**
4. Set  $\theta_{nh}^{k+1} = \theta_{nh}^k + \delta(\theta_{nh}^k)$ , and  $\theta_{lh}^{k+1} = \theta_{lh}^k + \delta(\theta_{lh}^k)$ .

# Local to Nonlocal Coupling: Numerical Tests, 1d

# Problem Setting (1D)

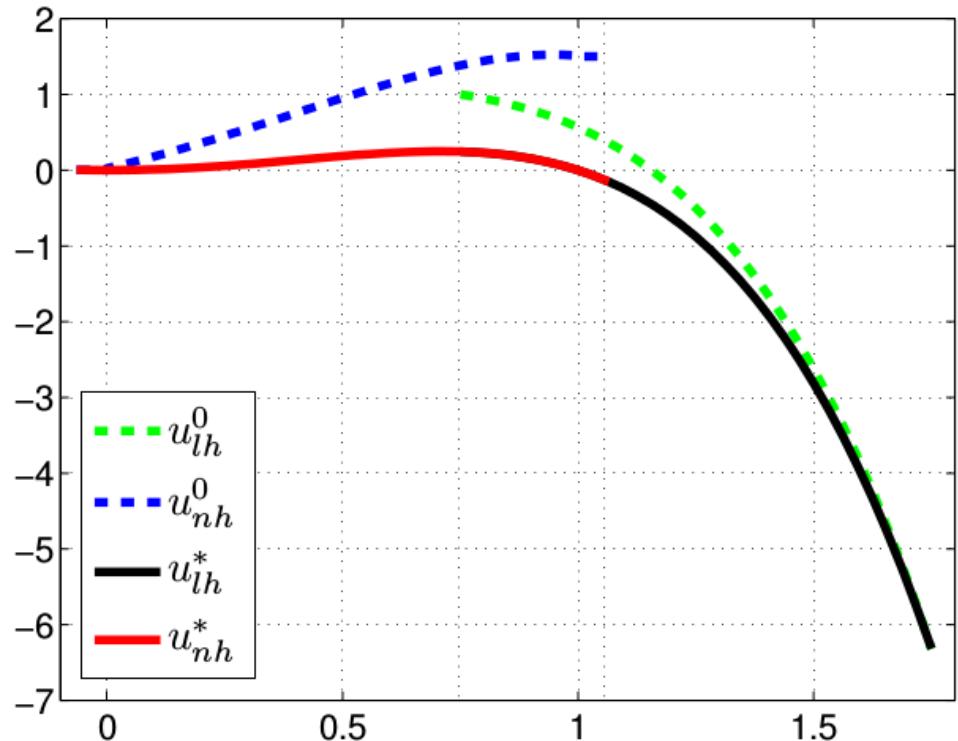

# NUMERICAL TESTS

**Kernel:**  $\gamma(x, y) = \frac{1}{\varepsilon^2|x - y|}\chi(x - \varepsilon, x + \varepsilon)$

## Accuracy tests:

- $u_n = u_l = x^2 - x^4$
- $f_n = -2 + 12x^2 + \varepsilon^2$
- $f_l = -2 + 12x^2$ .

**Nonlocal domain:**  $:= [0, 2.5] \times [0, 0.5] \times [0, 0.5]$

**Local domain:**  $:= [1.5, 4] \times [0, 0.5] \times [0, 0.5]$

**Overlap domain:**  $:= [1.5, 2.5] \times [0, 0.5] \times [0, 0.5]$

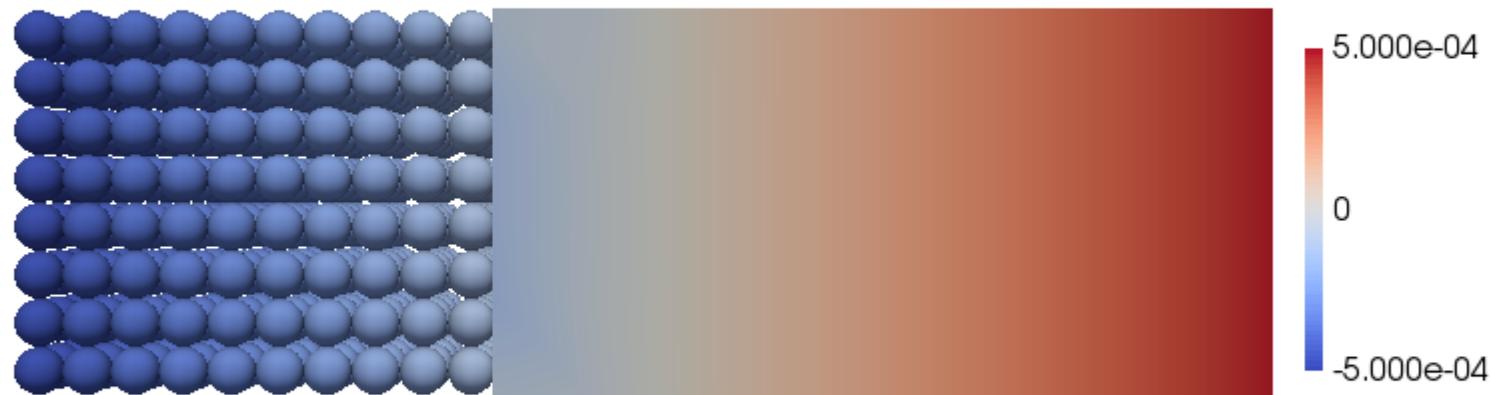

**Kernel:**  $\gamma(\mathbf{x}, \mathbf{y}) = \begin{cases} \frac{3}{\pi \varepsilon^4} \frac{1}{\|\mathbf{x} - \mathbf{y}\|} & \|\mathbf{x} - \mathbf{y}\| \leq \varepsilon \\ 0 & \text{otherwise,} \end{cases}$

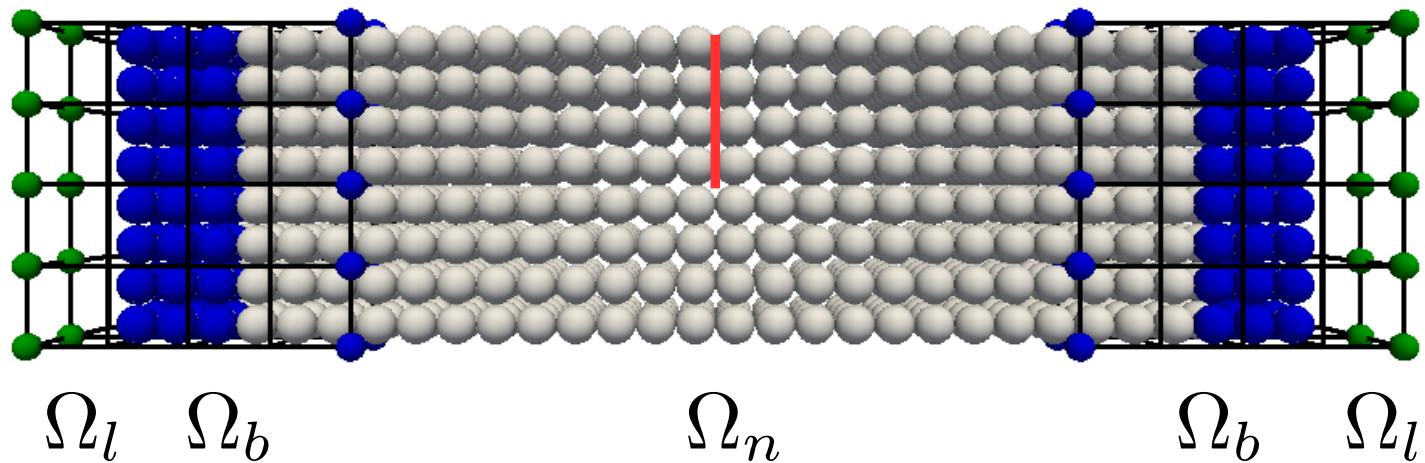

# The Patch Test

**Analytic solution:**  $u_{anl}^* = x - \frac{5}{3}$ , prescribed in  $0 \leq x \leq 0.5$  and on  $x = 4$

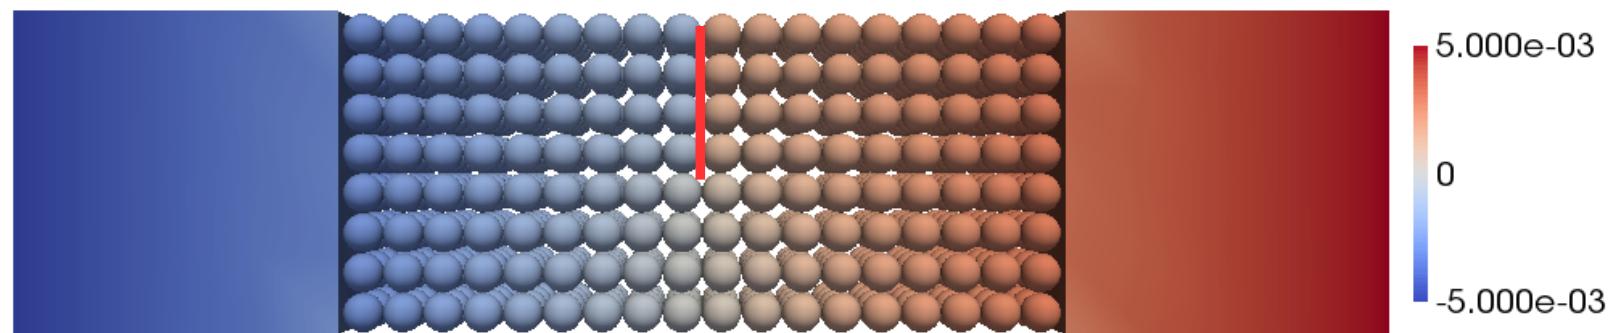

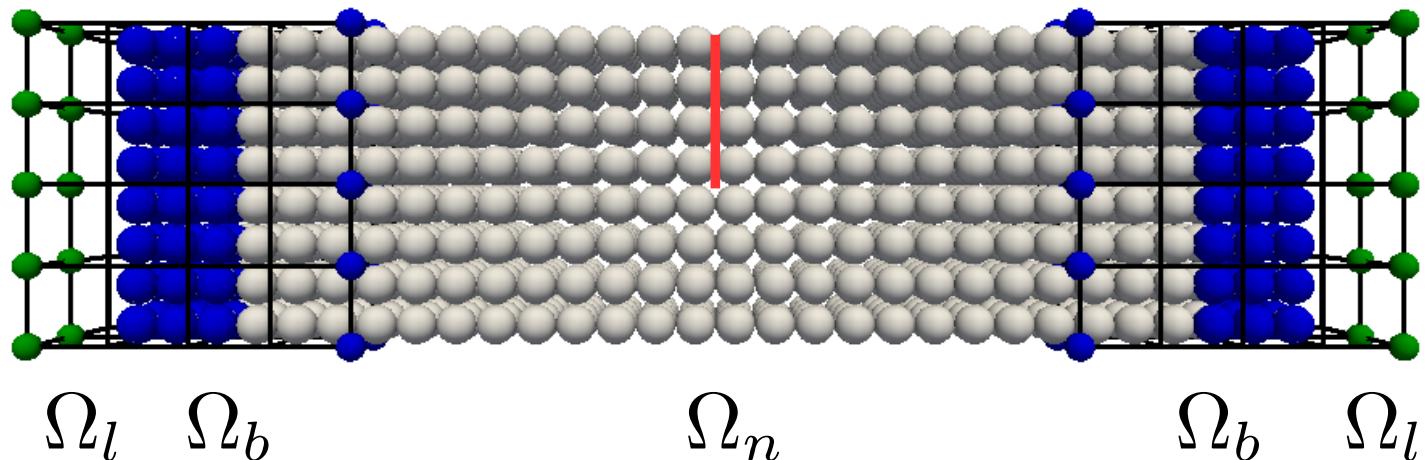

**LtN control:** initialized at zero in  $2 \leq x \leq 2.5$  and on  $x = 1.5$

# Conclusions

- Presented two nonlocal problems: cDFT and nonlocal Poisson
- Couplings needed to
  1. save computational time,
  2. make feasible (given limited resources) problems too complex to be solved
  3. use legacy codes, e.g. particle methods for nonlocal Poisson and FE for local one.
- Schwarz is in general rather robust but can fail when coupled models behave significantly differently on overlap region.
- Optimization-based coupling is a very general/flexible framework, although it can be expensive.
- Alternative methods not discussed here include the Blending method and the Arlequin method.

Thank you!
