

# Mechanical Property Variation in Metal Lattice Structures

# GOAL

Improve the understanding of how defects impact mechanical properties to enhance designers' ability to manufacture metal lattice structures reliably.

# Overview

- Evaluate properties of lattice struts
  - EOS M270
  - Stainless steel 17-4 PH powder
- Vary size and orientation
  - Strut diameters: 0.5 mm, 0.65 mm, and 0.82 mm
  - Vertical and horizontal build orientations
- Non-destructive evaluation of parts
  - Geometry characterization
  - Density measurements
  - CT scans
- Destructive evaluation
  - Tensile tests
  - Failure analysis

# Octet Truss Lattice

- Lattice structures offer favorable tradeoffs between strength and weight
- Structurally efficient due to nodal connectivity

# Single Unit Cell Builds

- Individual strut behavior is difficult to analyze in the full lattice structure
- Data depicting how defects impact these small features is important in understanding lattice behavior
- Concerned about struts bending due to limited boundary conditions

# Deformation Studies

## Plastic Test

## Abaqus Simulation

# Vertical Strut Builds

- Spacing based on the octet truss design
- Horizontal and vertical copies
- Three different sizes (representing 3, 4, and 5 mm unit cells)

# Build Layout

# Build Process

1. DMLS the 17-4PH steel parts on an EOS M270
2. Heat treat while on build platform: Austenitizing by heating (solutionizing) to 1900°F for an hour, then air/oil cool
3. Remove from build platform
4. HIP with the following parameters: 2125±25 °F x 240±60 min x 14.75±0.25 ksi
5. Heat treat again: Austenitizing by heating (solutionizing) to 1900°F for an hour, then air/oil cool, and then complete the H1150 heat treatment.

# Future Work

- Non-Destructive Evaluation
  - Ultrasonic testing and CT scanning of solid samples
  - Density measurement replications
  - Geometric comparison to CAD model
- Destructive Evaluation
  - Tensile tests
  - Failure analysis with SEM
- Look for correlations between NDE and part performance
