# Selection of endpoint/hardware model depends on the experiment you want to perform

# Tools available in SST span spectrum

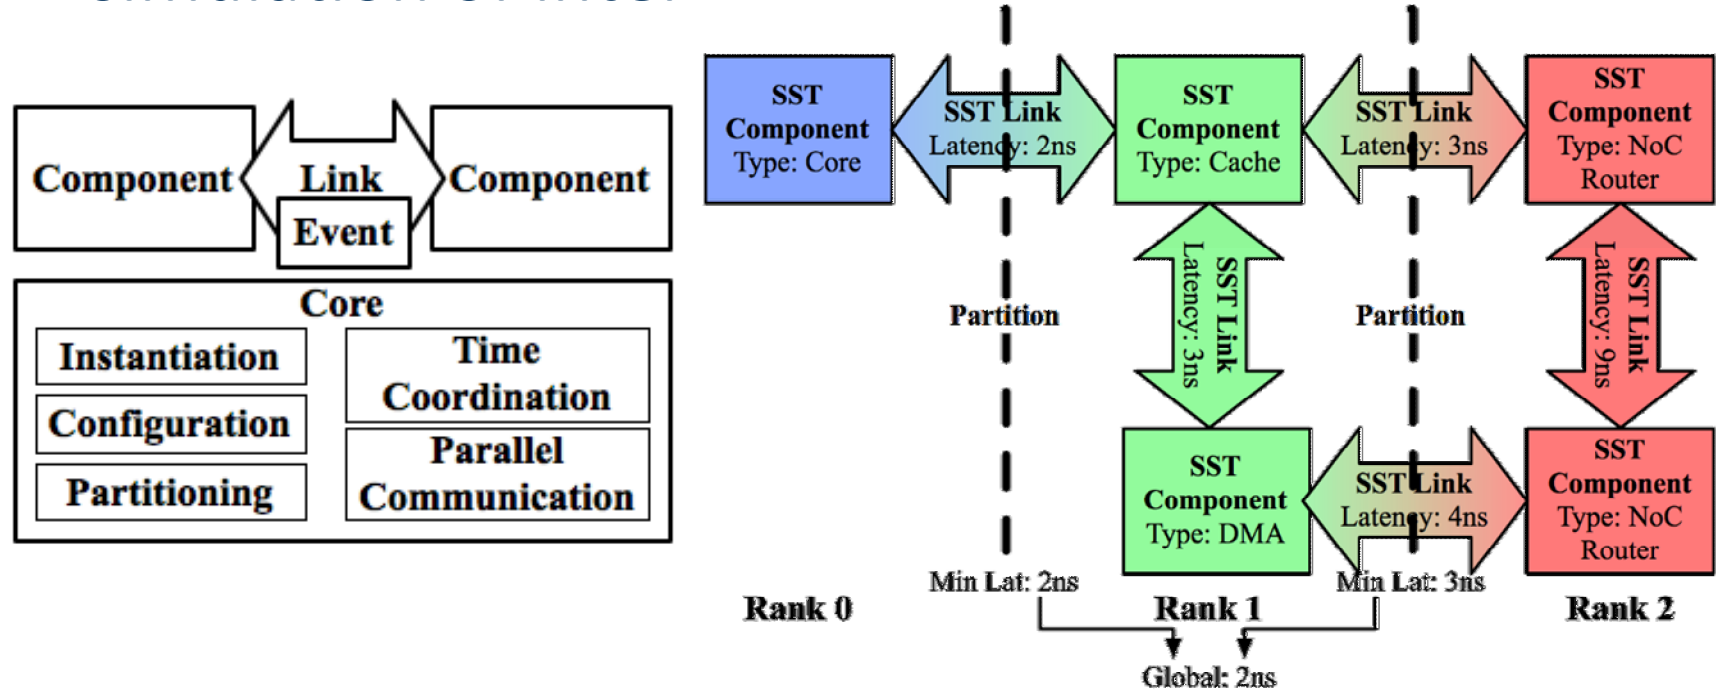

## ease of use/flexibility/efficiency

- Trace replay
  - (+) Easy to setup, reasonable accuracy
  - (-) Not flexible, need large compute resources to collect trace
- Ember motif: state-machine generating compute/comm calls
  - (+) Computationally efficient, flexible
  - (-) Work to setup, data-dependent control flow difficult
- Skeleton app: compile and link MPI codes directly into simulation
  - (+) No interface to learn (just MPI code), most flexible
  - ( ) If auto-skeletonizing compiler, not difficult to generate
  - (-) Work to write from scratch, work to skeletonize existing code

| Method                 | Human setup difficulty | Flexibility | Computational efficiency |
|------------------------|------------------------|-------------|--------------------------|
| Traces                 | Lowest                 | Lowest      | Lowest                   |
| Motifs                 | Medium                 | Medium-High | Highest                  |
| Skeleton               | Medium                 | High        | High                     |
| Dynamic Skeleton/Motif | High                   | Highest     | Medium-High              |

# SST is designed from ground-up to enable parallel simulation of interchangeable components

- PDES is a challenging problem – no need to repeat it for every problem domain
  - Partitioning
  - Lookahead optimization/computation
  - Synchronization/event delivery
- SST aims for optimal balance of human time versus computer time
  - Focus on conservative (easier model development) over massively parallel (optimistic)
  - Python input file that builds components and connects them with links

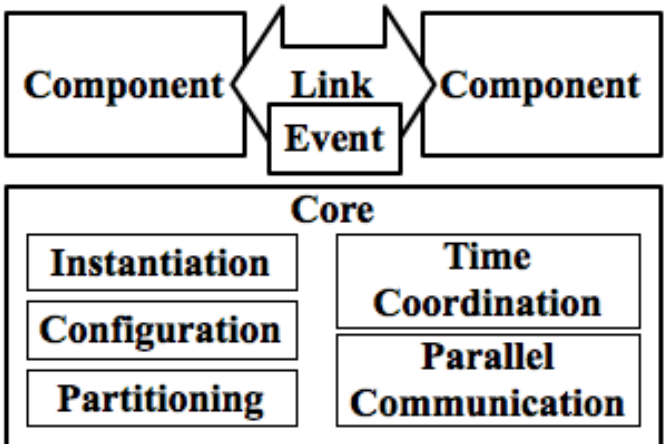

# Model for industry/academic collaboration with SST has interchangeable components

## Workload models:

Endpoint  
Interface

## SST Core

Device  
Interface

## Device Models:

# Many models with varying accuracy/cost in SST element libraries

**Endpoints:** Ember  
Skeleton apps,  
DUMPI/OTF traces  
PIN traces

**Libraries:** Hermes,  
Firefly, SUMI

**API Emulation:**

MPI, uGNI,  
libfabrics,  
Conceptual (LANL)

Endpoint  
Interface

**Memory:** HMC model,  
memHierarchy, CramSim,

**Network:** Merlin,  
PISCES, MACRELS

**Processor:** Miranda,  
Prospero, Ariel

# The basics of skeleton apps in SST/macro

## Sample from Lulesh code

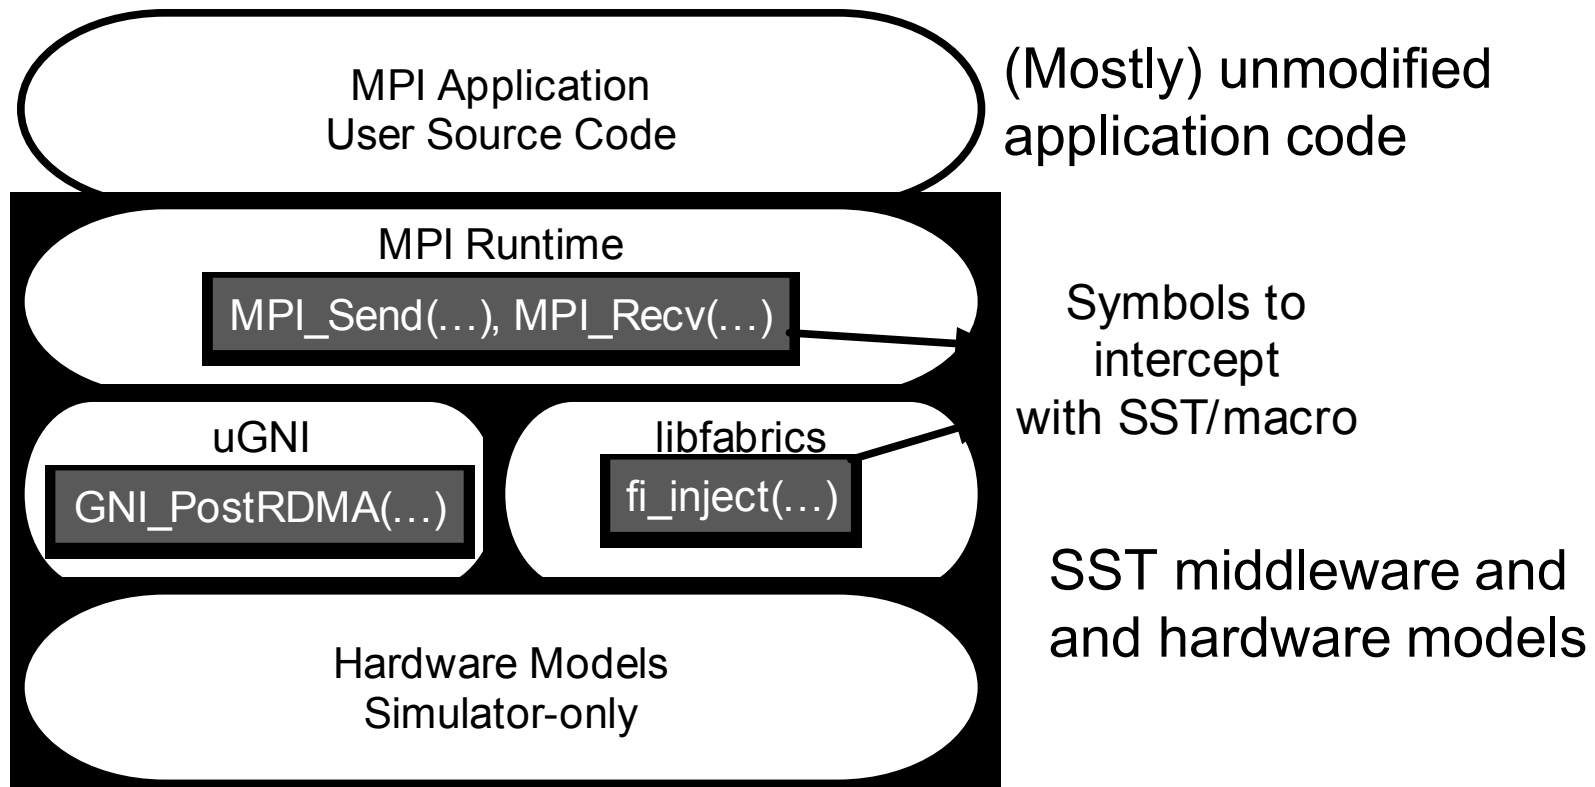

```
if (planeMax) {  
    /* contiguous memory */  
    int fromRank = myRank + domain.tp()*domain.tp() ;  
    int rcvCount = dx * dy * xferFields ;  
    MPI_Irecv(&domain.commDataRecv[pmsg * maxPlaneComm],  
             rcvCount, baseType, fromRank, msgType,  
             MPI_COMM_WORLD, &domain.recvRequest[pmsg]) ;  
    ++pmsg ;  
}  
if (rowMin && doRecv) {  
    /* semi-contiguous memory */  
    int fromRank = myRank - domain.tp() ;  
    int rcvCount = dx * dz * xferFields ;  
    MPI_Irecv(&domain.commDataRecv[pmsg * maxPlaneComm],  
             rcvCount, baseType, fromRank, msgType,  
             MPI_COMM_WORLD, &domain.recvRequest[pmsg]) ;  
    ++pmsg ;  
}
```

Intercept MPI calls  
via compiler wrapper

```
$>sst++ lulesh-comm.cc -c -o lulesh-comm.o
```

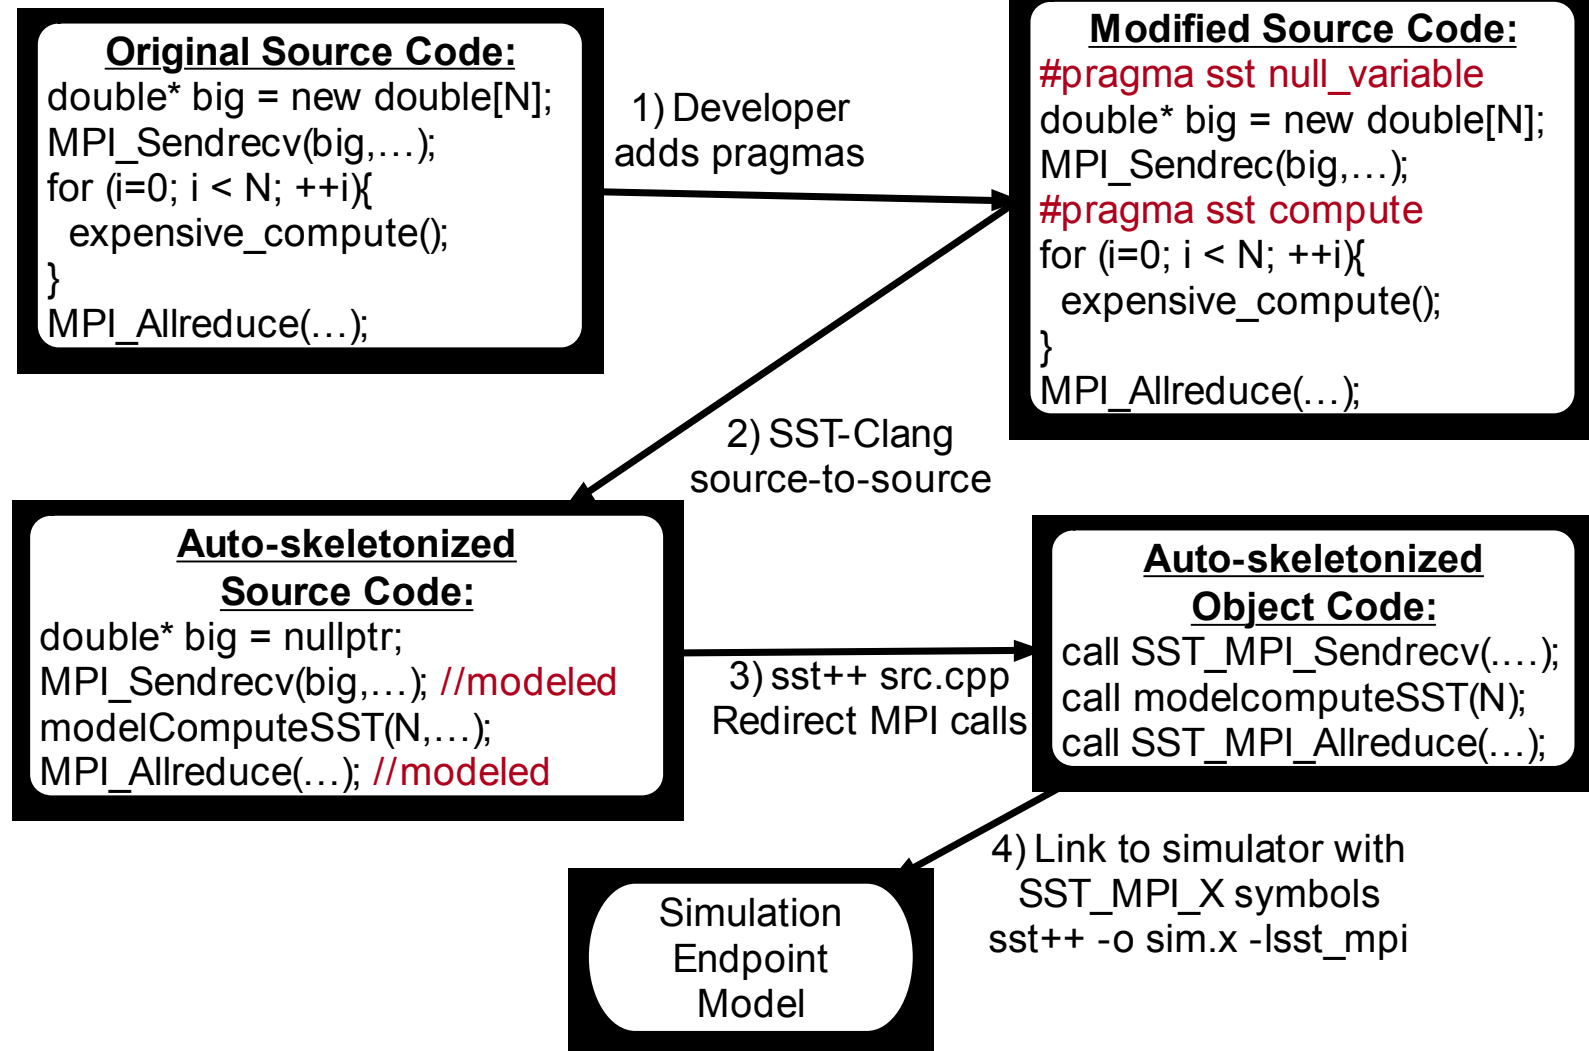

# Software stack simulation leverages low-cost context switching to provide “virtual” development environment

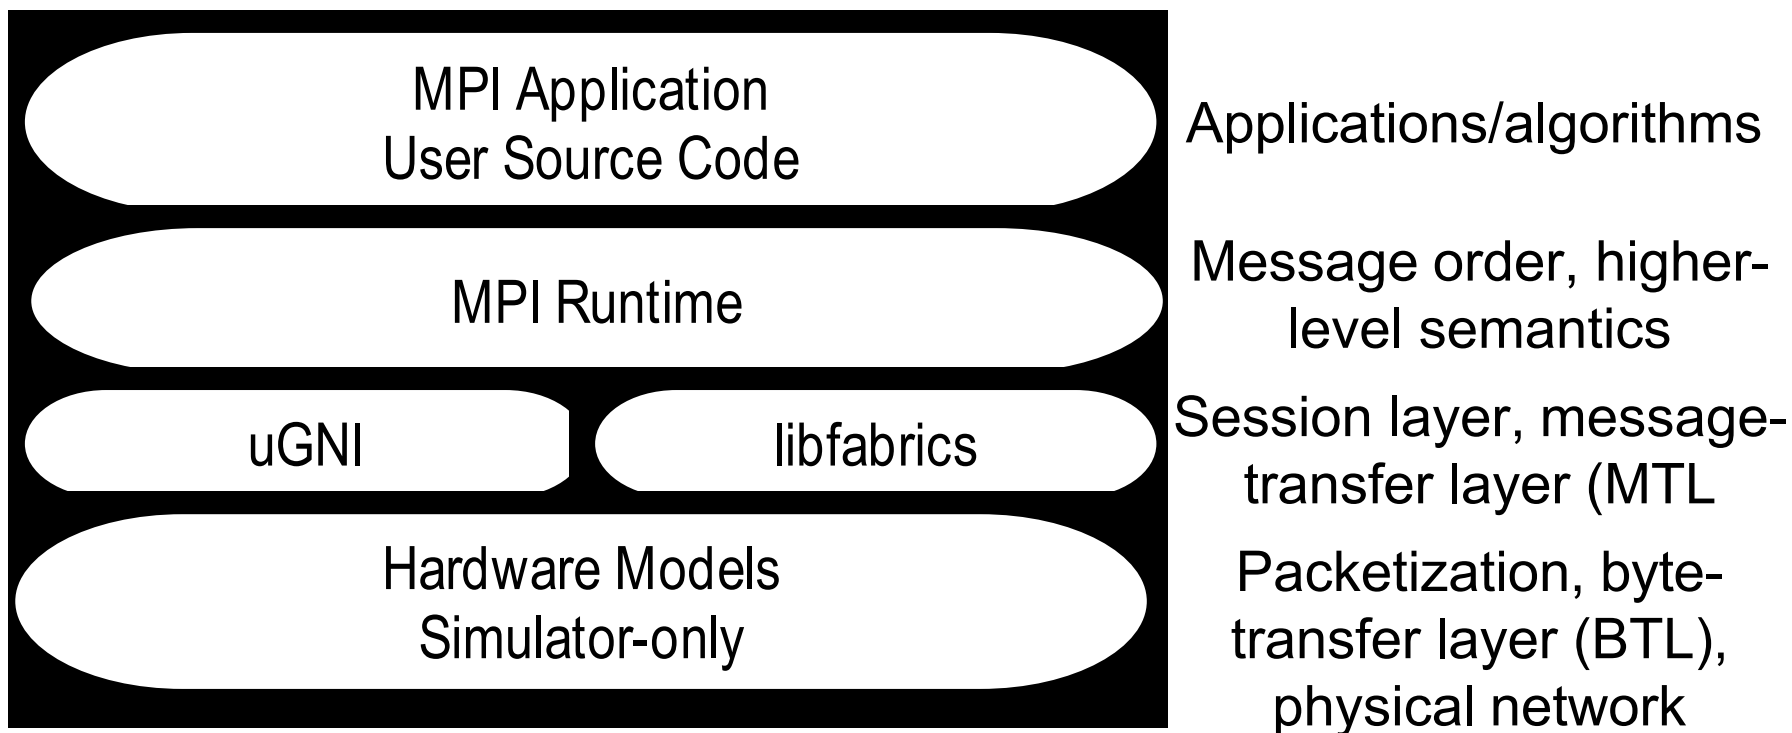

# Auto-skeletonizing SST compiler (mostly auto)

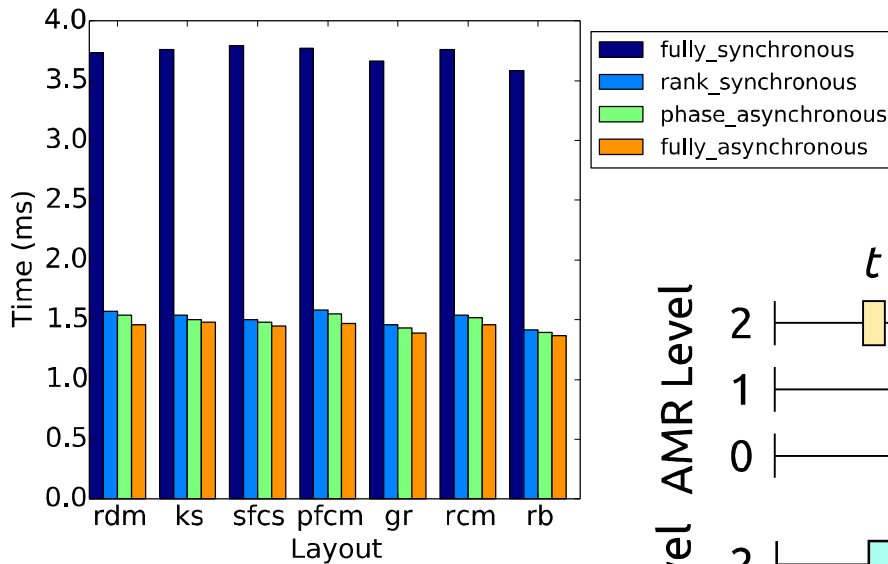

# Enables experimentation, direct software development of different layers of network stack

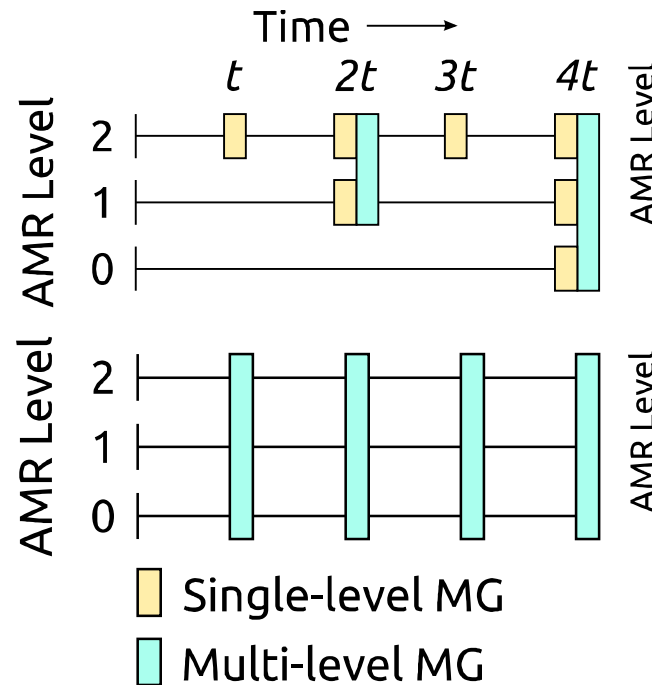

# Assesses algorithmic refactoring without needing to overhaul/debug code

Allreduce → Iallreduce  
Waitall → Waitany

Removing blocking  
collectives drastically  
reduces times, other levels  
of asynchrony give limited  
performance gains

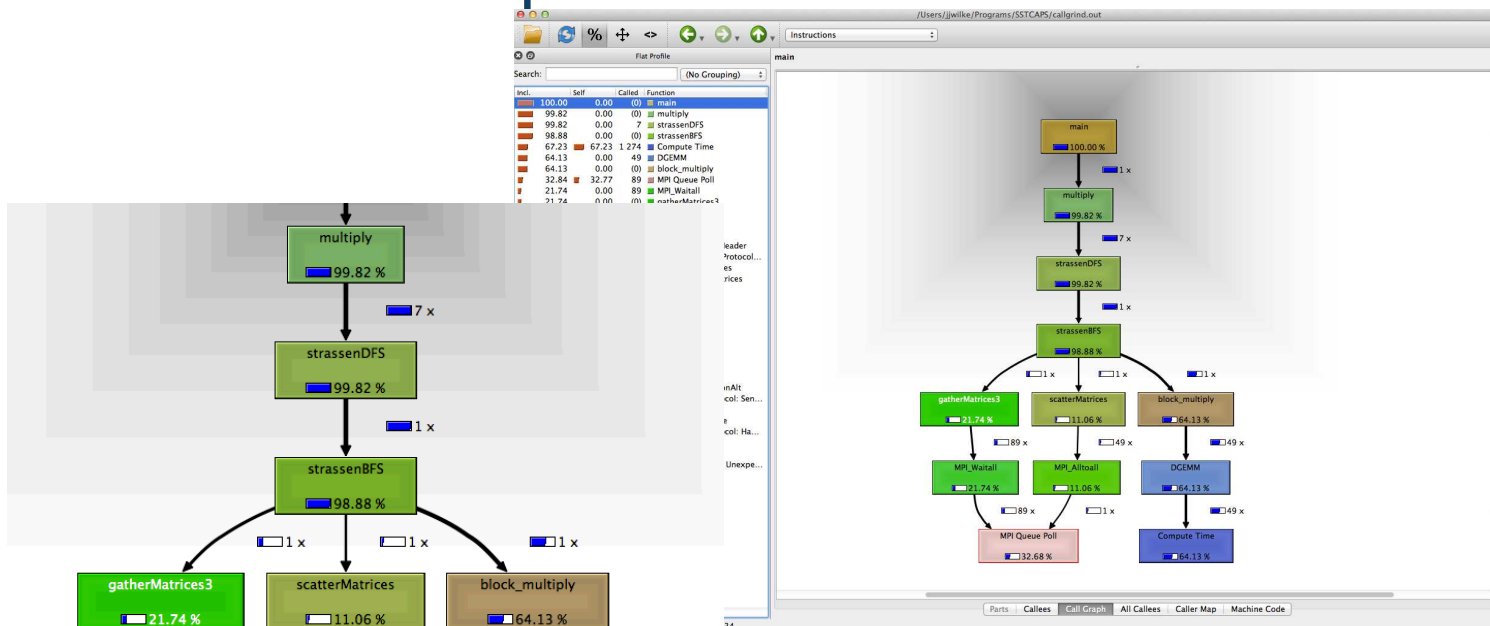

a)

b)

# Extract statistics from virtual software stacks just as done in real performance tools

Application Activity Over Time

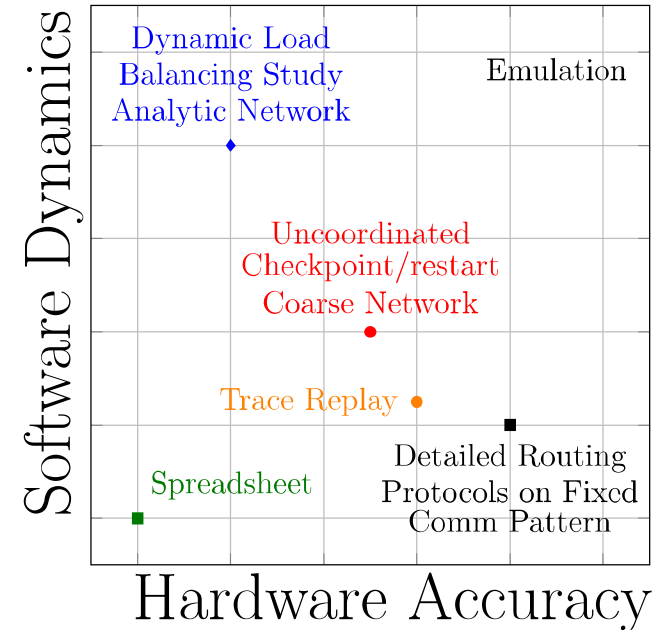

# Conclusions

- Large hardware/software design space available to simulation
- Choice of endpoint model/network model depends on research focus/system scale/human time available

| Method                 | Human setup difficulty | Flexibility | Computational efficiency |
|------------------------|------------------------|-------------|--------------------------|
| Traces                 | Lowest                 | Lowest      | Lowest                   |
| Motifs                 | Medium                 | Medium-High | Highest                  |
| Deterministic Skeleton | Medium                 | High        | High                     |
| Dynamic Skeleton       | High                   | Highest     | Medium-High              |
