Sandia National Laboratories

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia LLC, a wholly owned subsidiary of Honeywell International Inc. for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

- **Marine Hydrokinetics Technology**
- **Capital Expenditures (CAPEX) and Operational Expenditures (OPEX)**
- **Lesson from other renewables**
- **Approaches to Increase Performance, Assess the Resource and Reduce Costs**
 - **Advanced Controls**
 - **Advanced Materials**
 - **Device Performance Modeling**
 - **Other areas**
- **Concluding remarks**

Water Power Technologies

The Water Power Technologies program conducts applied research to improve the performance and reliability of marine hydrokinetic (MHK) technologies while lowering the cost of energy.

History & Impact

- Began in 2009 out of DOE Offshore Wind
- Supports ~25 researchers and collaborative capabilities in 9 Sandia organizations.
- Increased power absorption by ~200% using Advanced Dynamics and Controls for experimental Wave Energy Converter (WEC)
- Developed software for performance and costs, Adapted by industry & universities.
- Wave Energy Prize - Supported winning teams.
- U.S. Water Power could power 81 Million new homes; Up to ~700,000 new jobs¹.

Technical Strategy

- Leverage expertise in Advanced Controls, Materials Research, Device Performance Software and High-Fidelity Modeling.
- Leverage Sandia capabilities across departments, partner with industry & universities.

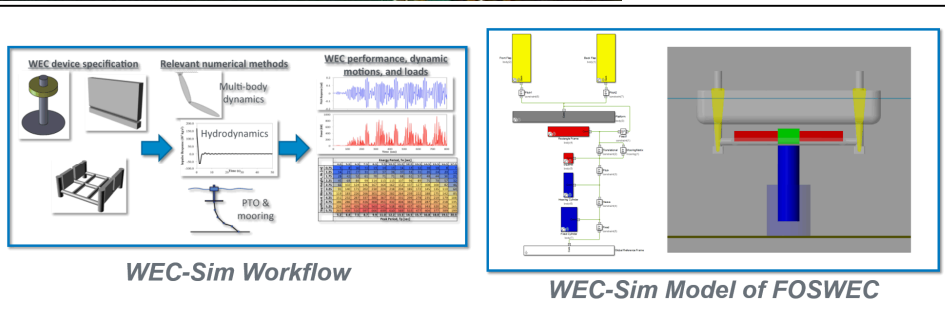

Water Power Technologies

The Water Power Technologies program conducts applied research to improve the performance and reliability of marine hydrokinetic (MHK) technologies while lowering the cost of energy.

Opportunities

- Testing/collaboration at DOD Maneuvering And Sea Keeping (MASK) basin in Bethesda, MD.
- Developing new power take-off test stand.
- 6 Staff members work with 5 industry partners, 6 universities – joint funding opportunities.
- Evolving device design standardization: Engaging with international standards committees & on industry technical projects.

LCOE Formula: Approaches to Lower the Costs

$$\text{LCOE} = \frac{(\text{FCR} \times \text{CapEx}) + \text{OpEx}}{\text{AEP}}$$

Focus on Materials Selection and Research +
Best Practices to Reduce Costs

Focus on Component / System
Performance Increases

LCOE = Levelized Cost of Energy

AEP = Annual Energy Production

CapEx = Capital Expenditures¹

OpEx = Operations and Maintenance
Expenditures²

*Does the Traditional LCOE
approach capture all the
value for Water Power or
other Renewables?*

LCOE Formula (CapEx Categories)

- Development
- Infrastructure
- Mooring/Foundation
- Device Structural Components
- Power Take Off (PTO)
- Subsystem Integration & Profit Margin
- Installation
- Contingency

$$\text{LCOE} = \frac{(\text{FCR} \times \text{CapEx}) + \text{OpEx}}{\text{AEP}}$$

LCOE Formula (OpEx Categories)

- Marine Operations & Maintenance (O&M)
- Shore-side Operations & Maintenance (O&M)
- Post Installation Environmental O&M
- Replacement Parts
- Consumables
- Insurance

$$\text{LCOE} = \frac{(\text{FCR} \times \text{CapEx}) + \text{OpEx}}{\text{AEP}}$$

Lessons from Other Renewables:

Wind Power

- Mature industry – Predominantly a 3-Blade Design
- Optimizing systems for LCOE—not always for component performance

EXAMPLE:

Increasing the wind rotor size to capture more energy

- Wind turbine capacity factor is inherently higher for low specific power designs due to:
 - Increased energy capture at the same wind speed
 - Reduction in the turbine's rated wind speed
- At 6 m/s, the energy production is over 80% higher for a specific power design of 150 versus 400 W/m²
- Can increase the energy capture while maintaining constant system loads

The proposed blades reach unprecedented lengths

Lessons from Other Renewables: Wind Power

- Economies of Scale can reduce OpEx
 - Wind farms → Wave Energy Converter Farms
 - Leverage & minimize visits for operations and maintenance
 - Design choice: Extreme load survival (3 blade, upwind)
- Co-location may reduce LCOE
 - Offshore wind combined with Marine Hydrokinetic (MHK) devices
 - Cycles of wind and waves may be off → potentially manage the loads on the wind towers by extracting the wave energy
- MHK industry still growing
 - Fundamental R&D still ongoing, lower TRL levels in many areas
 - Too early for Learning (Experience) Curve cost-reducing effects?

PV Module Experience Curve example

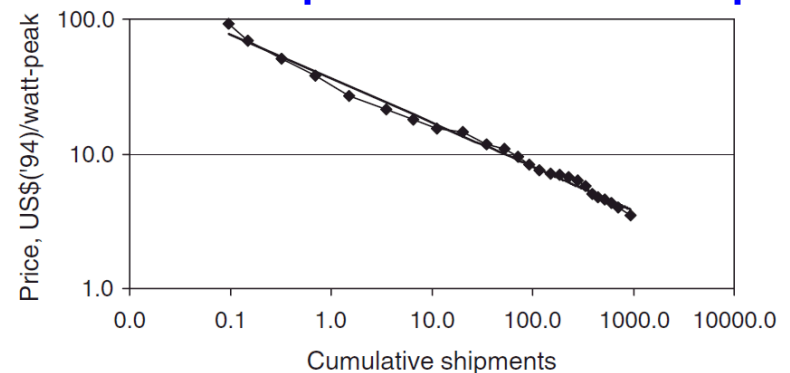

Fig. 7. An experience curve for PV modules (adapted from Harmon, 2000).
(Kobos et al., 2006)

Lessons from Other Renewables: Wind

- Commodity Costs affected Wind ~2009
 - e.g., Steel prices increased – tower costs represent ~50% of CapEx costs
- Turbine Upscaling

MHK LCOE insights

Current Energy Converters

- Literature: 30-60 ¢/kWh
- Reference Model Insights:

| | 1-unit | 10-unit | 50-unit | 100-unit |
|---------|---------|---------|---------|----------|
| RM1 | \$ 1.99 | \$ 0.40 | \$ 0.20 | \$ 0.17 |
| RM2 | \$ 2.67 | \$ 0.78 | \$ 0.42 | \$ 0.35 |

CEC LCOE ESTIMATES

WEC LCOE ESTIMATES

Device Performance Modeling: Reference Models

Developed 6 public domain designs to obtain baseline performance and Cost of Energy (COE) estimates

Incorporated:

- Power performance models • PTO Design
- Structural models • O&M / Installation
- Anchor and Mooring Design • Permitting & Environment
- Economic Model

Project Impact:

- All reference models are public domain serving broader stakeholder needs
- Process of obtaining COE facilitates knowledge / modeling tool gaps that the industry is facing thus allowing DOE to target their research dollars effectively
- The creation of independent and experimentally verified COE across multiple device architectures legitimizes the comparison

Information Dissemination:

- Project reports, Reference model designs
- Data from scaled model studies, COE model spreadsheets
- Release of RM5 and RM6 information

Using Reference Models

RM2: River Current Turbine

Photo: crossflow turbine testing at the Naval Academy tow tank

Tested: Turbine tested at multiple labs, the University of Minnesota & the University of New Hampshire.

Reference Model Results/Estimates: 10 MW Installed Capacity

- CECs
 - $\approx \$0.31\text{-}0.45/\text{kWh}$
 - Varying resource conditions impact installation, permitting, capacity factors, etc.
- WECs
 - $\approx \$0.98\text{-}1.53/\text{kWh}$
 - At 10 MW structural mass is the largest contributor to LCOE.

Technology Build out will help verify Cost reductions

Increasing Performance: Test Wave Energy Converter Hardware & Controls

**Maneuvering and Seakeeping (MASK) basin
Naval Surface Warfare Center, Carderock Division
(NSWCCD)**

- Built 1962
- Dimensions: 106x76x6m deep
- Updated wavemakers in 2013
 - 216 individual flaps
 - Peak wave power is approximately 1MW

MHK Composite Performance

Materials Research

Engineering designs of MHK devices have difficult, although not unique, materials challenges

lightweight yet stiff

Strong & durable

resist environmental degradation

inexpensive & easy to integrate into manufacturing

- Specialized applications require this level of materials application, knowledge and sophistication
- Challenges require broad experience to understand all of these challenges
- Our Technical Approach is to help bridge the technology gaps and knowledge that span across all four of these materials challenges through....

Coupons to Structural elements

Elements to Substructure

Testing to Dissemination (host database)

| Material | Type | Material Name | Properties |
|--------------|-----------|---------------|---------------------------|
| Carbon Fiber | Composite | Carbon Fiber | High strength, low weight |
| Kevlar | Composite | Kevlar | High strength, low weight |
| Fiberglass | Composite | Fiberglass | High strength, low weight |
| Carbon Fiber | Composite | Carbon Fiber | High strength, low weight |
| Kevlar | Composite | Kevlar | High strength, low weight |

| Kevlar | Composite | Kevlar | High strength, low weight |
| Fiberglass | Composite | Fiberglass | High strength, low weight |

- **Hosted Workshop to Identify Composite Related Barriers** – What are the composite materials related manufacturing science and engineering barriers that increase the costs?

Device Performance Modeling: WEC-Sim

SNL (Kelley Ruehl) &
NREL collaboration

Used by the WEC community to simulate WEC dynamics and reduce WEC design uncertainty and improve power performance

Wave Energy Converter Simulator

- Developed in MATLAB/Simulink using the multi-body dynamics solver SimMechanics
- Models devices comprised of rigid bodies, power-take-off systems, and mooring systems
- Performs time-domain simulations in 6 degrees-of-freedom
- Download it on GitHub: <https://github.com/WEC-Sim/WEC-Sim>

Helped **Wave Energy Prize** contestants (5/9 finalists)

Large-scale **adoption by industry / academia / researchers** domestically and internationally, notably:

Device Performance Modeling

WECs must be designed to respond to ocean waves: Probabilistic methods for predicting extreme design loads → Improve best-practices for design response analysis of WECs

Images courtesy of Columbia Power

Concluding Remarks

→ LCOE

- Can Reduce by:
 - Focus on Materials Selection & Research + Best Practices (CapEX)
 - Focus on increasing Annual Energy Output (increasing performance)
 - Including the System's Costs and Value-added benefits
- CED Cost drivers: Power Takeoff, Structure, O&M
- WEC Cost drivers: Structure, Mooring, O&M

→ **Advanced Controls, Materials Research, Systems Performance Modeling**

- Systems may increase power production substantially; provide longevity & cost reductions; increase performance, avoid challenges

→ **Learn** from the past experiences of other Renewable Energy Technologies that are closer/in the market today

THANK YOU
