²Lawrence Livermore National Laboratory, Livermore, California 94550, USA

Sandia National Laboratories is a multi-mission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC., a wholly owned subsidiary of Honeywell International, Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA-0003525. Lawrence Livermore National Laboratory is operated for the US Department of Energy under Contract DE-AC52-07NA27344. The authors gratefully acknowledge research support from the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Fuel Cell Technologies Office, under Contract Numbers DE-AC04-94AL85000 and DE-AC52-07NA27344.

Outline

1. Embedded-atom method potential for Fe-Ni-Cr-H
2. Analytical bond order potential for Al-Cu-H
3. Analytical bond order potential for Mg-H

Four criteria of fidelity of Fe-Ni-Cr interatomic potential

1. permit stable high temperature MD simulations
2. capture the correct stacking fault energy (γ_{sf})
3. prescribe well the elastic constants
4. give reasonable energy and volume for various compositions

Issues of literature potentials

1. The potential we published (CALPHAD 1993, 17, 383) did not consider the four criteria
2. Smith and Was' potential (PRB 1989, 40, 10322) was fitted to effective atoms and did not consider stacking fault energy
3. The 2013 version of Bonny et al's potential (MSMSE 2013, 21 085004) incorrectly predicts phase separation

4. The 2011 version of Bonny et al's potential (MSMSE 2011, 19, 085008) incorrectly predicts negative slope of stacking fault energy with Ni composition
5. Tong et al's potential (Mol. Sim. 2016, 42, 1256) incorrectly predicts large negative stacking fault energy ($\sim -200 \text{ mJ/m}^2$)

Current status of our Fe-Ni-Cr-H embedded-atom method potential

.....

Energy and volume trends

Wish list for Al-Cu-H potential

1. A high stacking fault energy of Al observed in experiments;
2. Properties trends of a variety of stable and metastable structures;
3. Al-rich side of the Al-Cu phase diagram;
4. A reasonable positive heat of solution of Cu in Al;
5. $H_2 \rightleftharpoons 2H$ chemical reaction;
6. $Al_{1-x}H_x \rightarrow Al + H_2$ and $Cu_{1-x}H_x \rightarrow Cu + H_2$ phase separations;
7. Robust MD simulations.

BOP captures a high stacking fault energy of Al.

Property trends of Al and Cu

Al

(a) Cohesive energy E_c

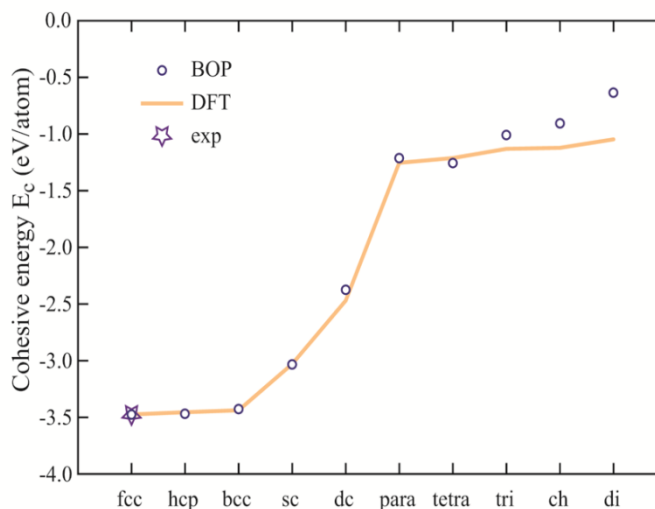

(b) Atomic volume Ω

Cu

(a) Cohesive energy E_c

(b) Atomic volume Ω

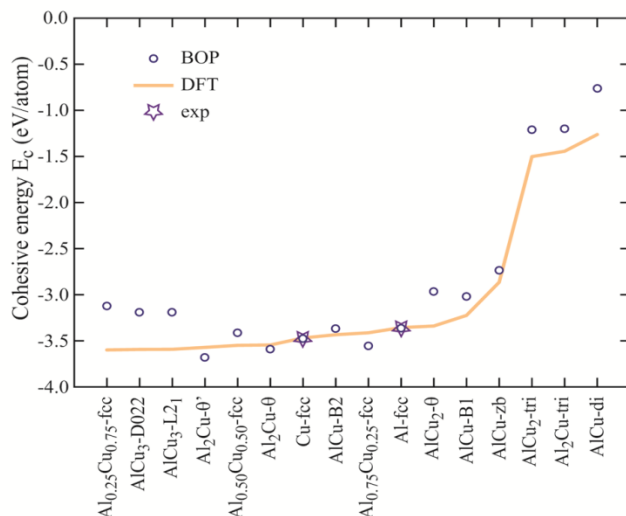

Pretty good property trends for Al and Cu.

Property trends of Al-Cu

(a) Cohesive energy E_c

(b) Atomic volume Ω

Heat of formation vs. composition

Pretty good property trends for AlCu.

Property trends of Al-H and Cu-H

AlH

(a) Cohesive energy E_c

(b) Atomic volume Ω

CuH

(a) Cohesive energy E_c

(b) Atomic volume Ω

Pretty good property trends for AlH and CuH.

Dilute heat of solution of Cu in Al

1. Traditionally, heat of solution of Cu in Al is taken as energy change due to taking a Cu atom from Cu pool and putting it in Al pool;
2. Should really be the energy change due to taking a Cu atom from Al₂Cu pool and putting it in Al pool;
3. Must be a positive number

 $T = 300$ K
 $R = 5.0$ nm/ns
 $t = 1.0$ ns

Crystalline growth of MgH_2 -rutile

$\text{H/Mg} = 4$, $E_i = 0.1$ eV
 $T = 400$ K, $R = 1$ nm/ns
 $t = 1$ ns

Time-evolution of growth

Summary

1. Our Fe-Ni-Cr EAM captures the four criteria critical for simulations of stainless-steels.
Hydrogen is yet to be added;
2. Our Al-Cu-H BOP captures the high Al stacking fault energy, the stability of Al_2Cu compound, and the H_2/H chemical reaction;
3. Our Mg-H BOP captures the crystalline growth of the rutile phase of MgH_2 hydride.
