

*Exceptional service in the national interest*

# Simulating Smoking Behaviors Based on Cognition-Determined Communication of Opinions

Asmeret Bier Naugle, Nadine Miner, Munaf Aamir, Robert Jeffers, Steve Verzi,  
Michael Bernard

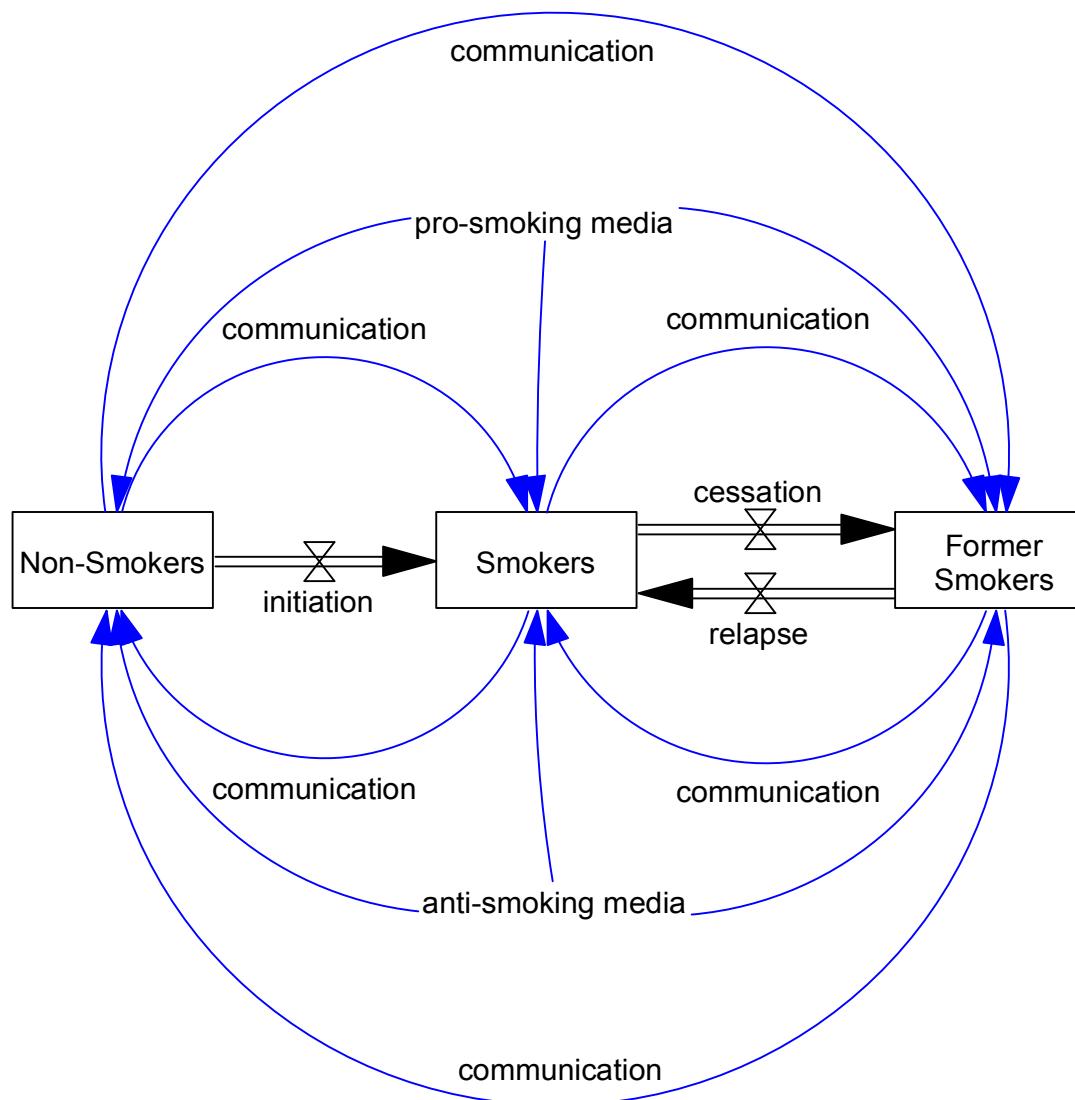

Sandia National Laboratories is a multi-program laboratory managed and operated by Sandia Corporation, a wholly owned subsidiary of Lockheed Martin Corporation, for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

# Simulating Smoking Behavior

- Existing work simulating smoking behaviors with opinion dynamics models
- Wanted to include details of cognition in determining how opinions change over time
  - Root causes of behaviors of interest
  - Beliefs, attitudes, intentions, affect, etc.
- Used Behavior Influence Assessment
  - Hybrid cognitive-system dynamics framework

# Basic Model Structure

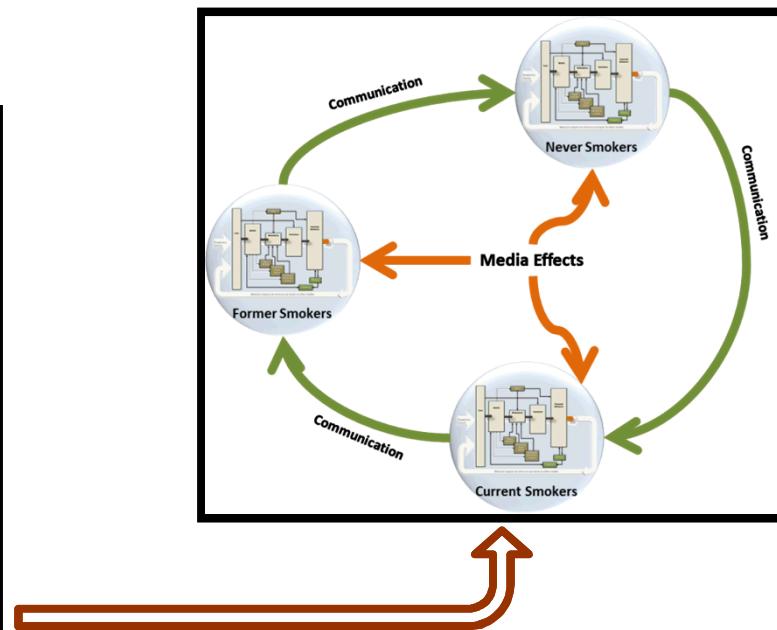

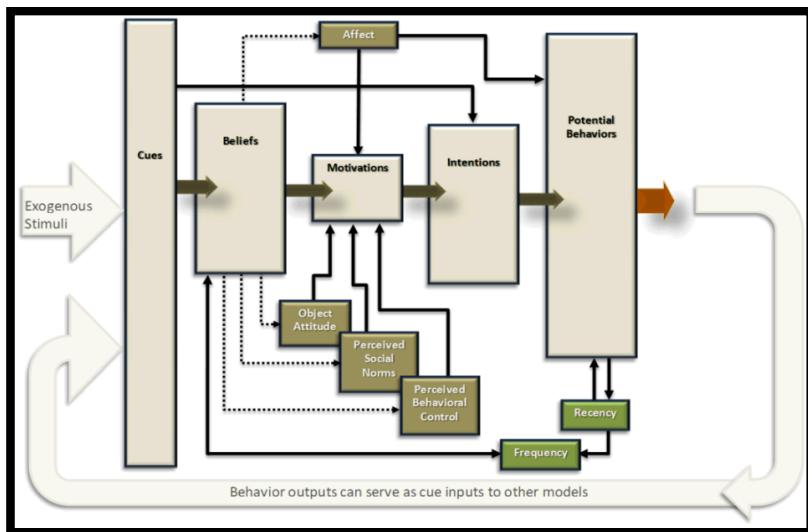

# Behavioral Influence Assessment

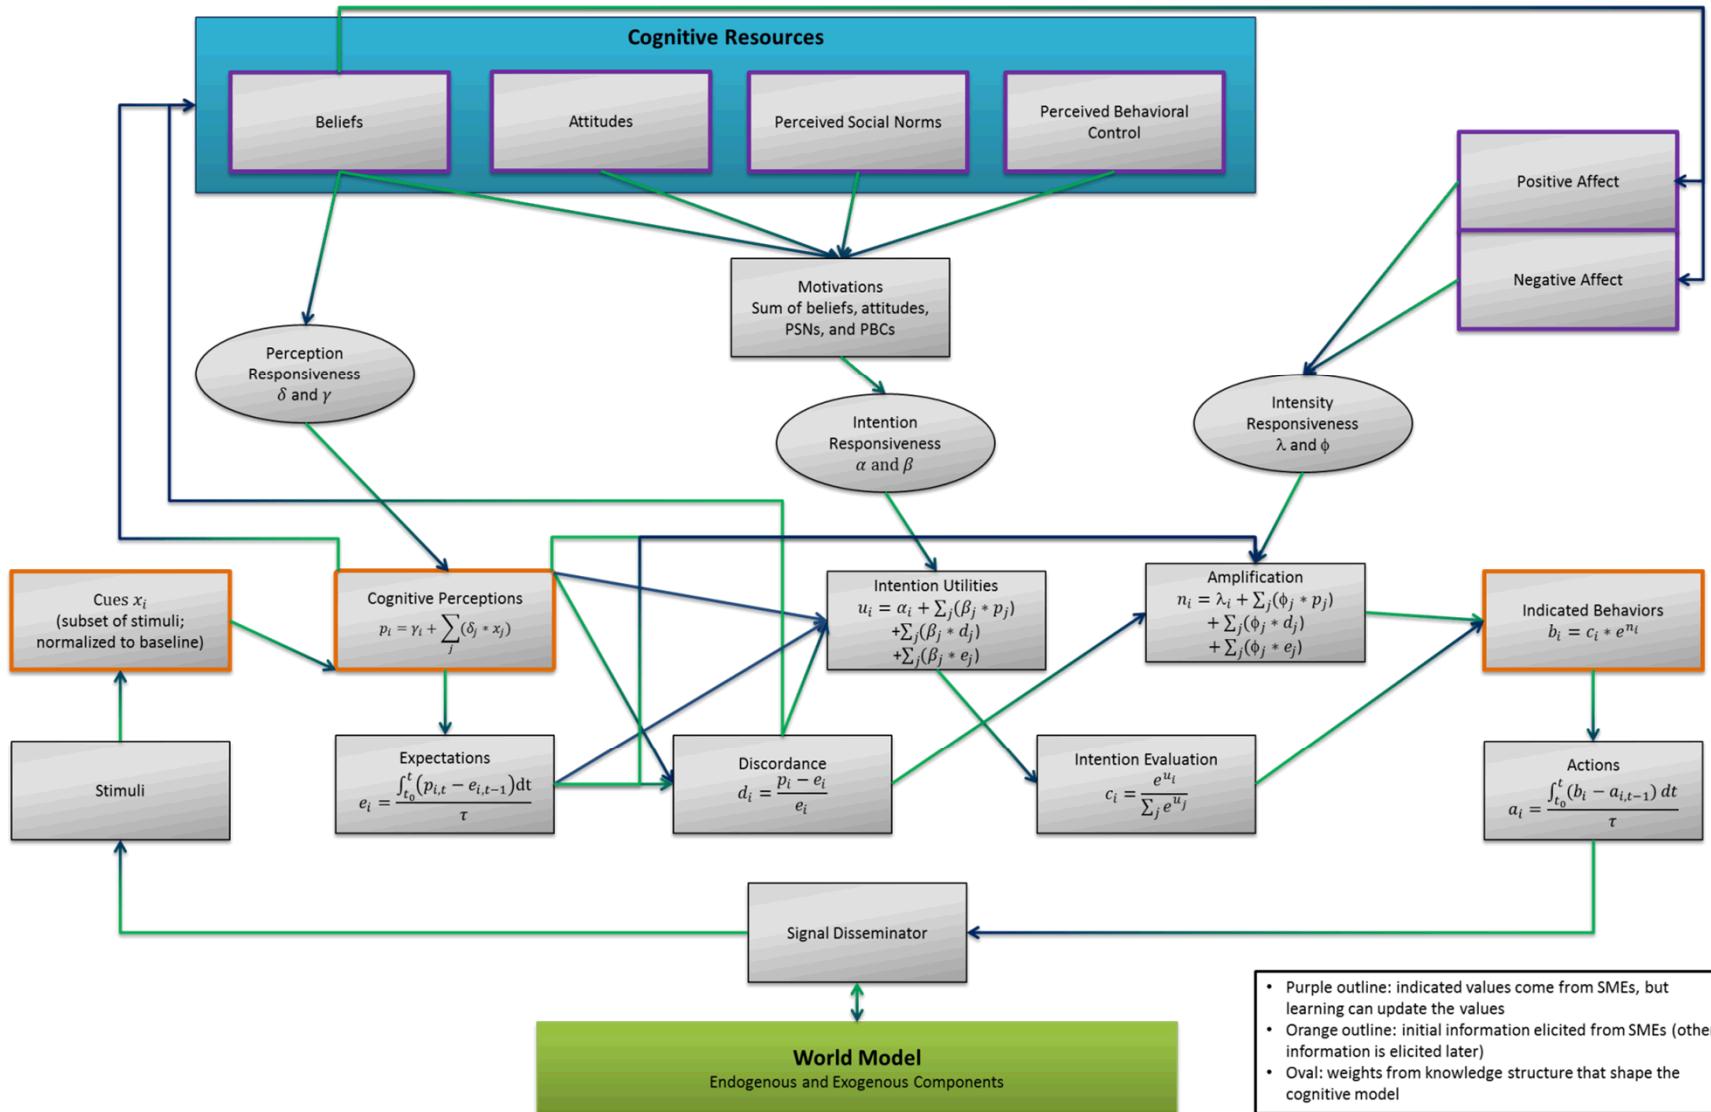

- In our application areas **human behavior** is important
  - Difficult to understand and model
  - SMEs, mental models are limited
  - Limited data, theory is useful but can't predict
- Goal: Build the best models possible, incorporating both physical and human components
  - Emphasize uncertainty

# Behavioral Influence Assessment (BIA)

- Hybrid modeling technique developed at Sandia National Laboratories
  - Cognitive and System Dynamics
  - Previous applications to political systems
- Used to improve understanding of the human dimension in order to better anticipate behaviors in response to potential events
- Theory domains: psychological, economic, social, historical, anthropological

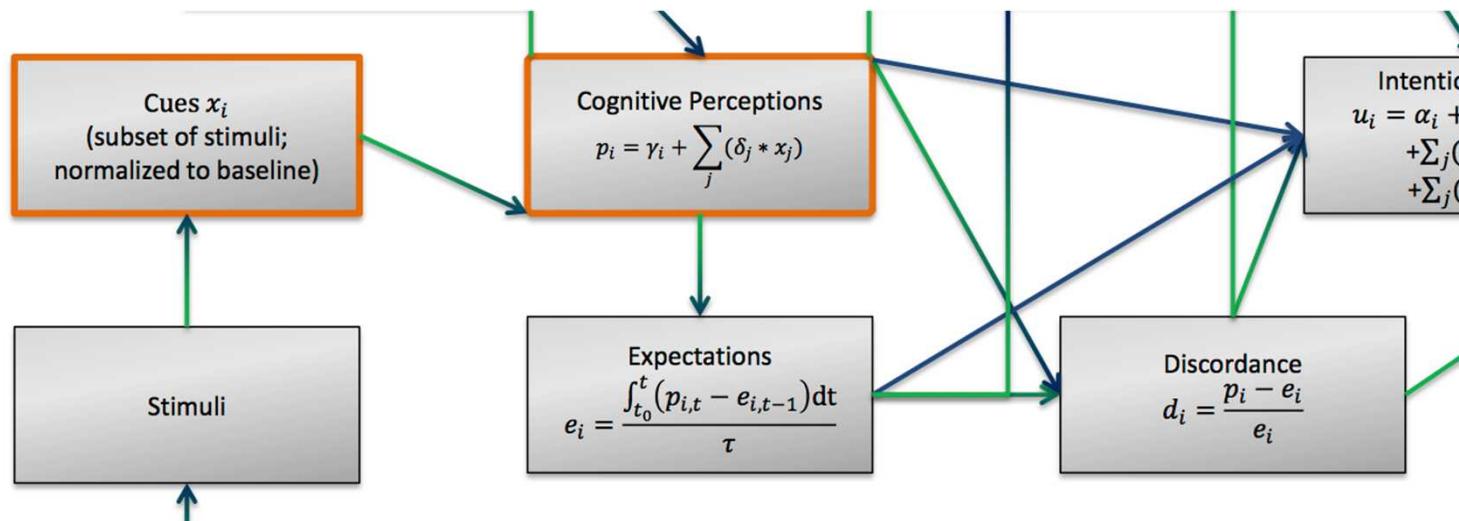

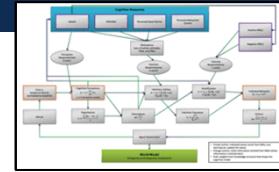

# Behavioral Influence Assessment - Cognition

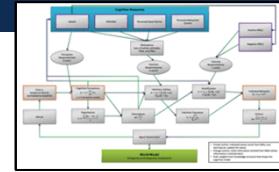

# Cognitive Model

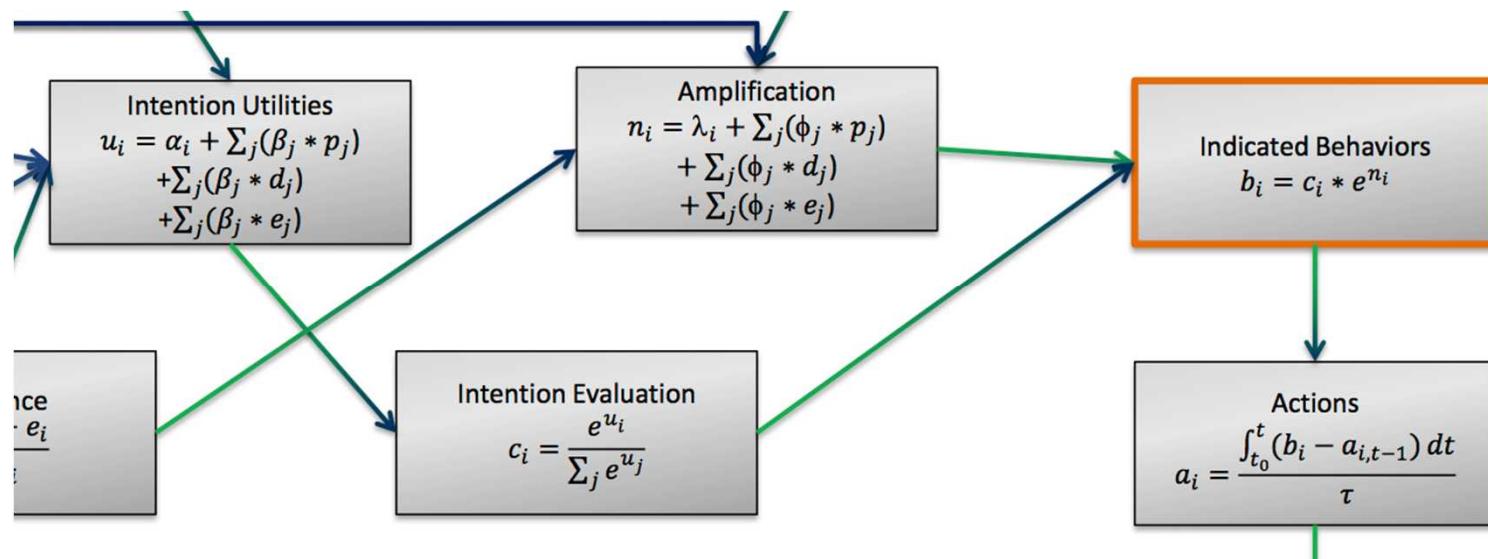

- **Cues:** Physical realization of world conditions or human action
- **Cognitive perceptions:** Interpretation of cues
- **Expectations:** Memory of status quo or anticipation of future conditions
- **Discordance:** Difference between perceptions and expectations

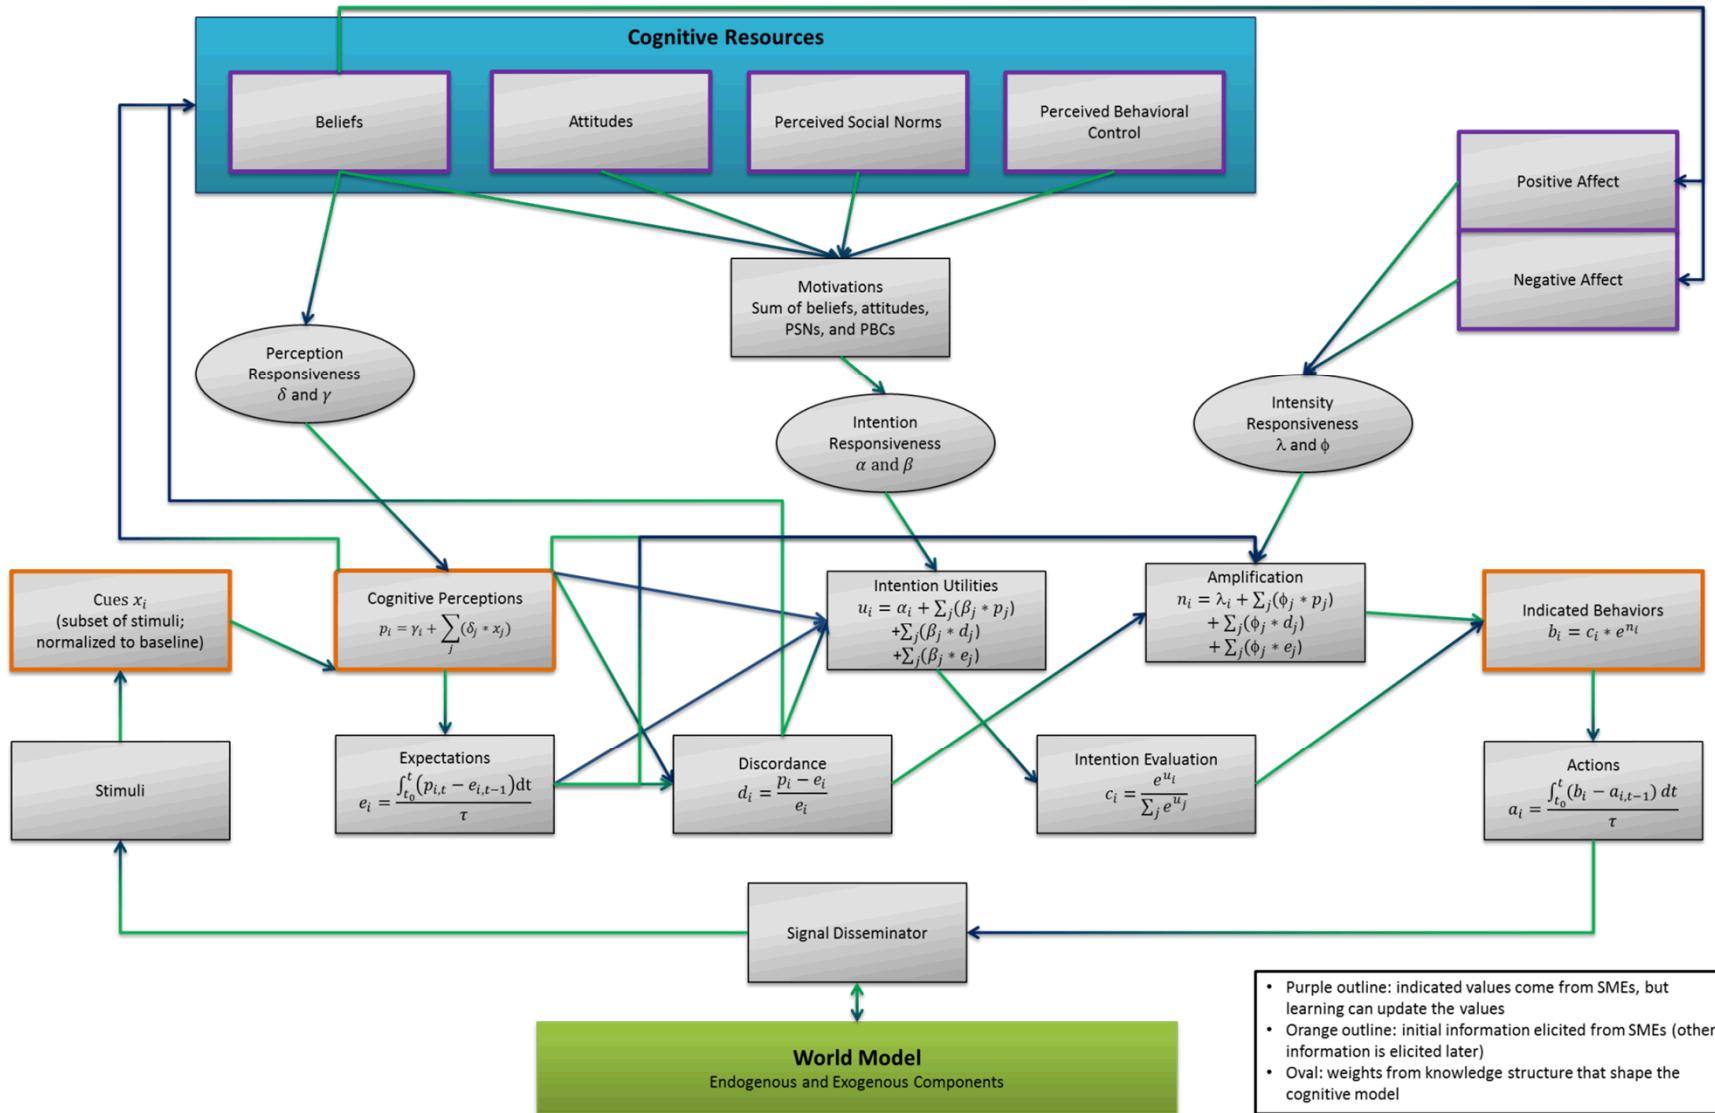

# Cognitive Model

- **Intention Utilities:** Perceived benefit of taking an action
- **Intention Evaluation:** Choice of action, based on Qualitative Choice Theory
- **Amplification:** Emotional or other intensification of intention
- **Indicated Behaviors:** Based on choice and amplification
- **Actions:** Physical realization of behaviors

# Behavioral Influence Assessment

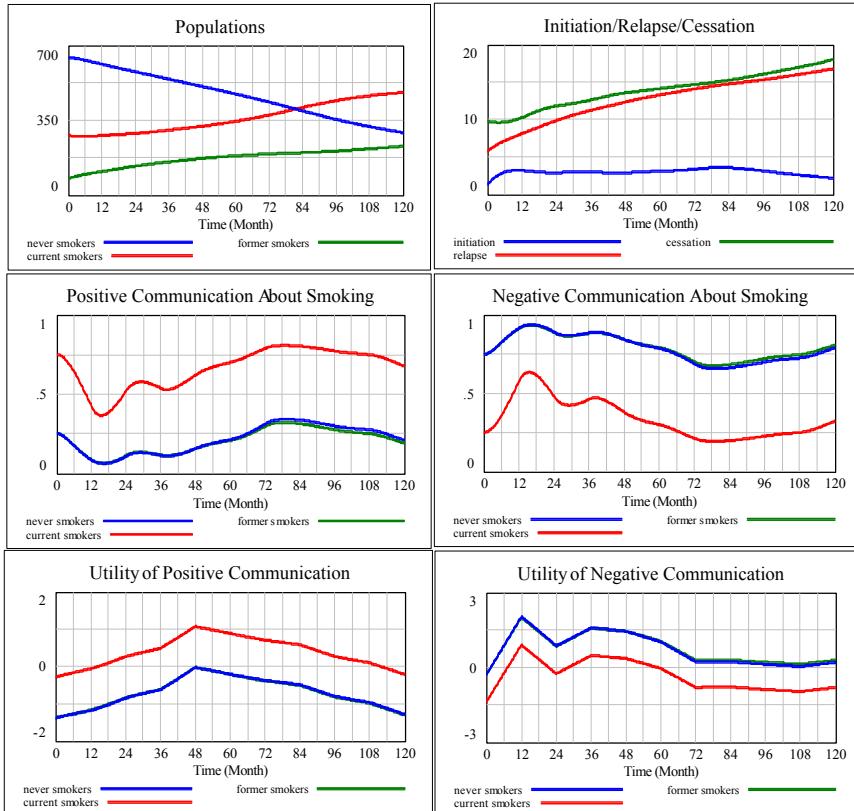

# Linking Perceptions to Behaviors

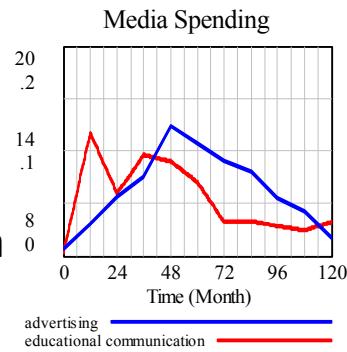

Potential Behaviors	Non smokers communicate negative opinion about smoking	Non smokers do not communicate negative opinion about smoking	Non smokers communicate positive opinion about smoking	Non smokers do not communicate positive opinion about smoking	Non smokers start smoking	Smokers communicate negative opinion about smoking	Smokers do not communicate negative opinion about smoking	Smokers communicate positive opinion about smoking	Smokers do not communicate positive opinion about smoking	Smokers quit smoking	Former smokers communicate negative opinion about smoking	Former smokers do not communicate negative opinion about smoking	Former smokers start smoking	Former smokers do not start smoking	Fraction of population that are non smokers	Fraction of population that are smokers	Pro smoking media targets	Anti smoking media targets	An*

# Illustrative Model Results

## Base Case

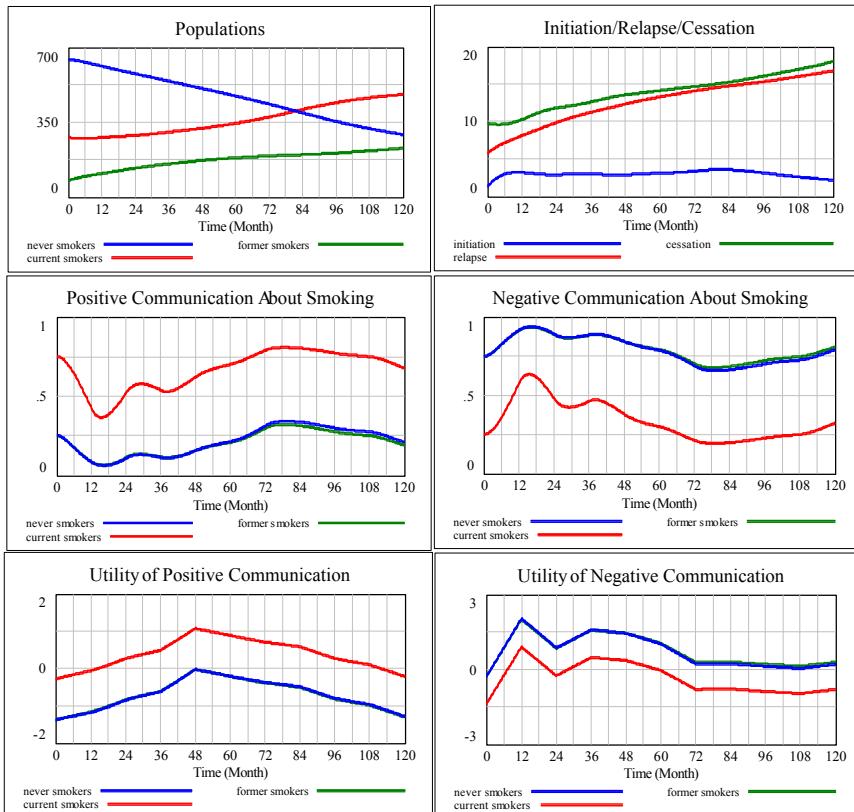

- Simple model
  - Static population of 1000
- Base case uses historical spending on advertising and educational campaigns
  - To approximate media spending
  - Other cases use multiplier on media
    - Kicks in at 24 months
  - Note that historical advertising spending is substantially higher than educational
- Initiation/relapse/success depend on opinions
  - Opinions depend on communication with others and with media
- Initial calibration shown – can be improved

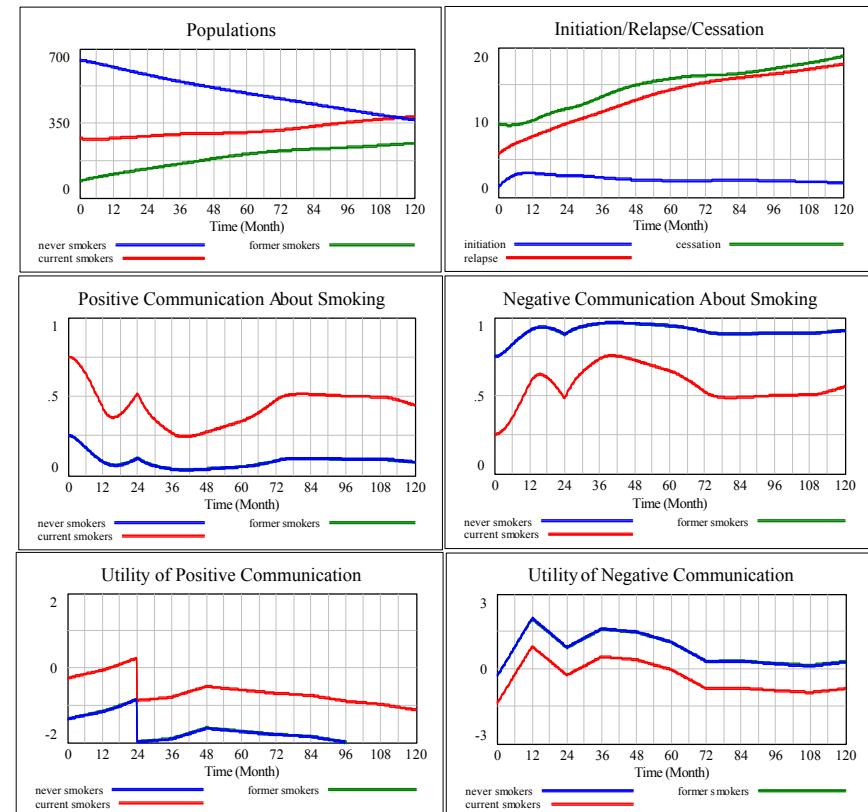

# Illustrative Model Results

## Base Case

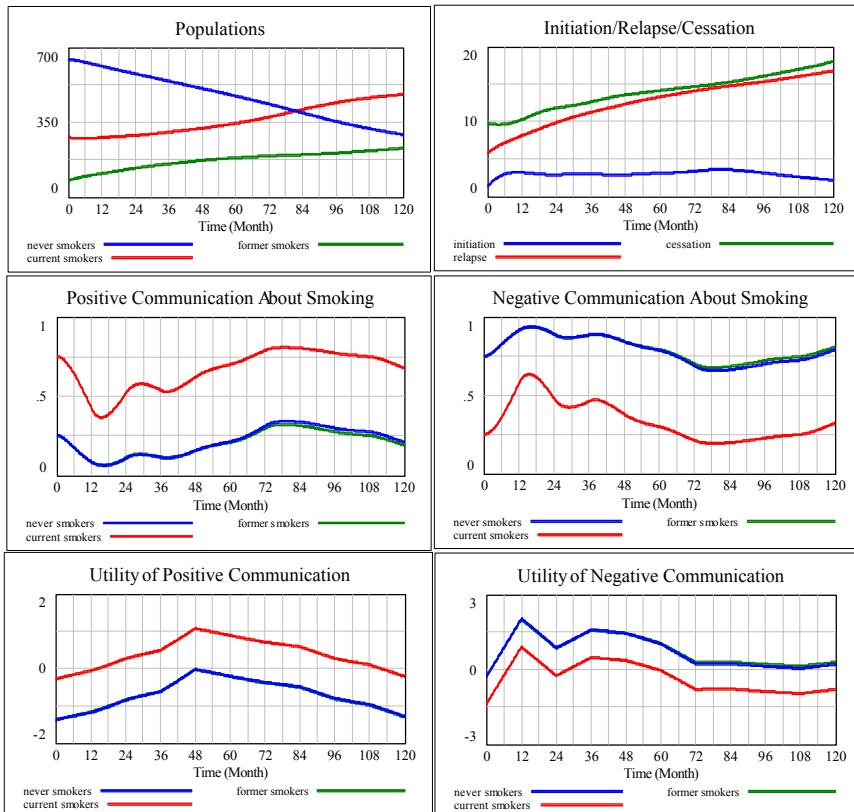

## Advertising Spending Cut in Half

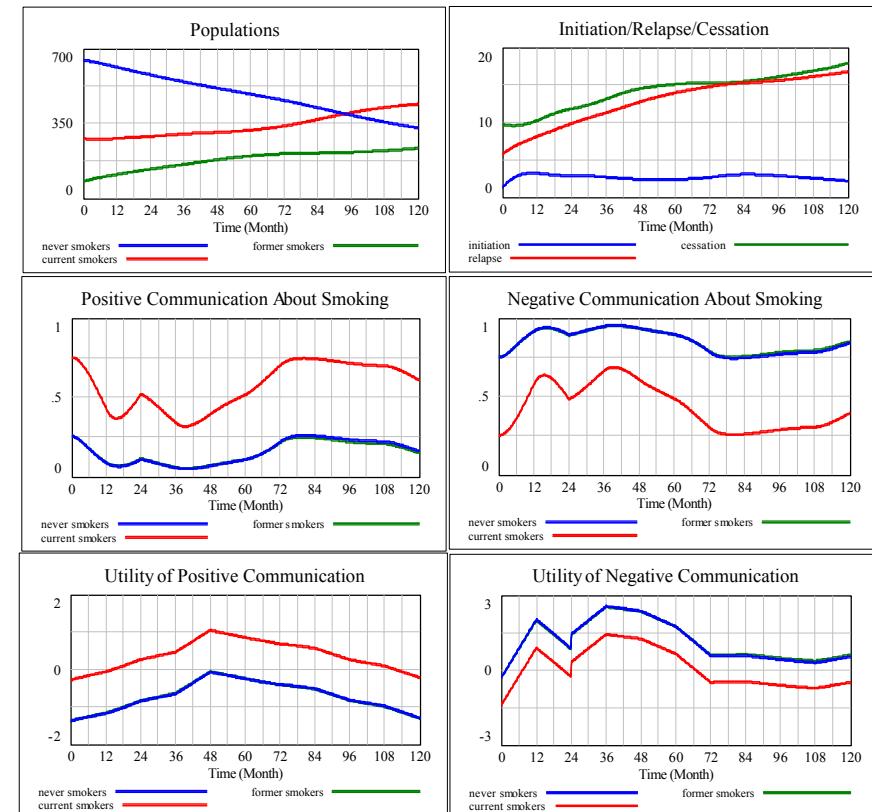

↑  
↑  
spending changes at month 24

# Illustrative Model Results

## Base Case

## Educational Spending Increased by Half

↑  
↑  
spending changes at month 24

# Conclusions

- BIA provides way to simulate opinion dynamics with details of cognition
  - Root causes of behaviors of interest
- Caveats on results
  - Comparing multiplicative changes to substantially different spending rates
  - Initial calibration only – more data and SME input needed
- Applied to smoking model with static population
  - Over-simplified
  - Initial results indicate potential utility of this type of assessment
- Able to look at efficacy of policies for altering behavior
  - Includes enough cognitive detail to understand why policies are effective (or not)
- Potential for BIA and opinion dynamics models to be used to validate each other
