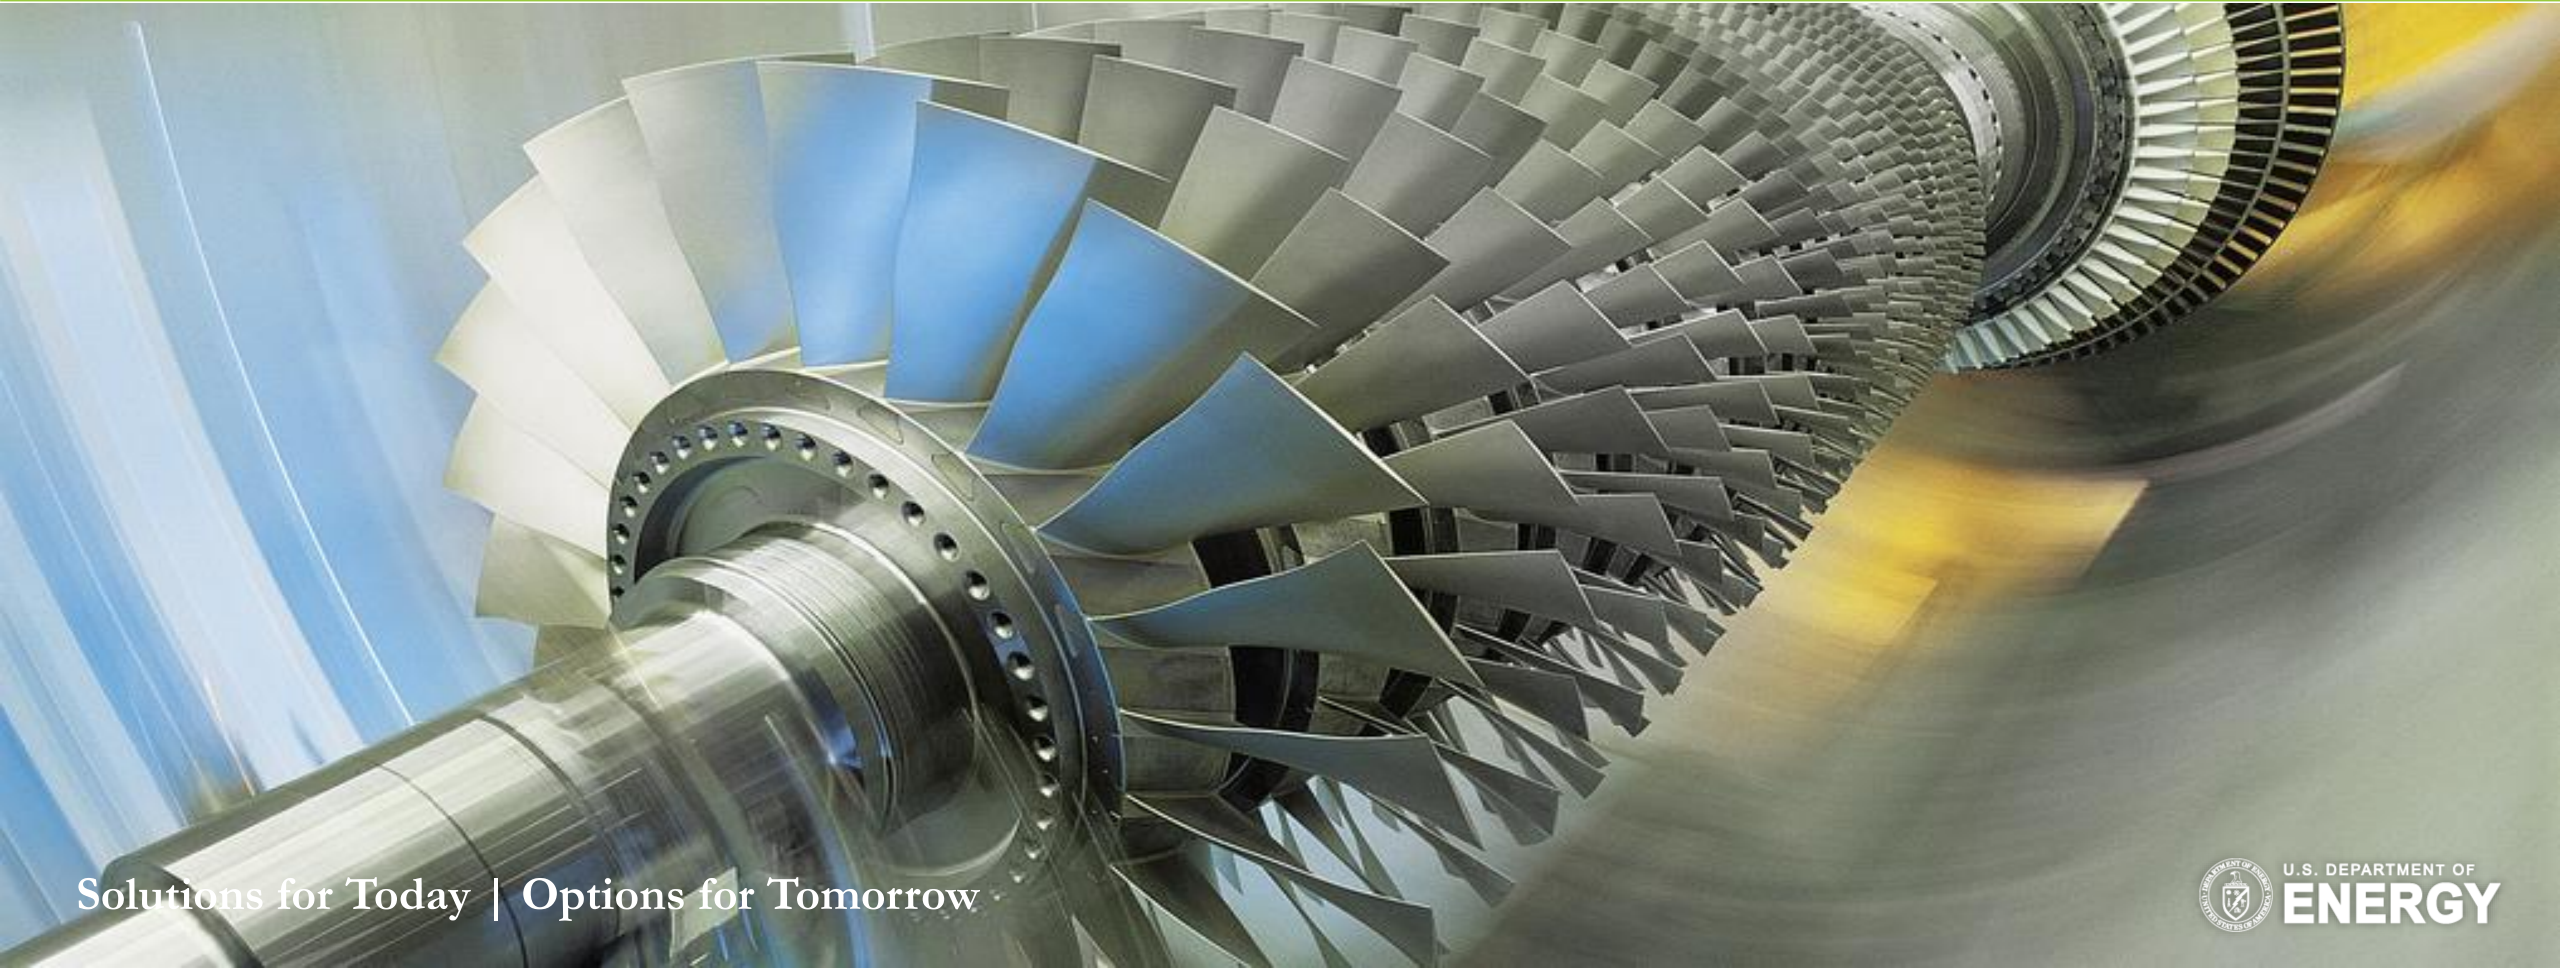
Regulatory Control of a 10 MWe Supercritical CO_2 Recompression Closed Brayton Cycle

E.A. Liese , P. Mahapatra, J.T. Albright, and S.E. Zitney

National Energy Technology Laboratory

2019 Annual Review Meeting for Crosscutting, Pittsburgh, PA, April 9-11, 2019



A Few Acronyms

- **SEA – Systems Energy Analysis Division at NETL**
- **PSER – Process Systems Engineering Research team in SEA**
- **sCO_2 – Supercritical CO_2**
- **RCBC – Recompression Closed Brayton Cycle**
- **STEP – Supercritical Transformative Electric Power. A 10 MWe net power demonstration plant being built at SwRI in San Antonio TX.**

Presentation Overview

- **SEA PSER sCO_2 Activities Overview**
- **Motivation for Control Studies of STEP Facility**
- **Control Methodology**
  - Steady-State and Dynamic Simulation Framework
  - Control Objectives
  - Control Architecture
- **Control Response Results**
  - Ramp down and up in RCBC cycle MW demand
  - Heat rejection water cooler temperature control
- **Future Work**

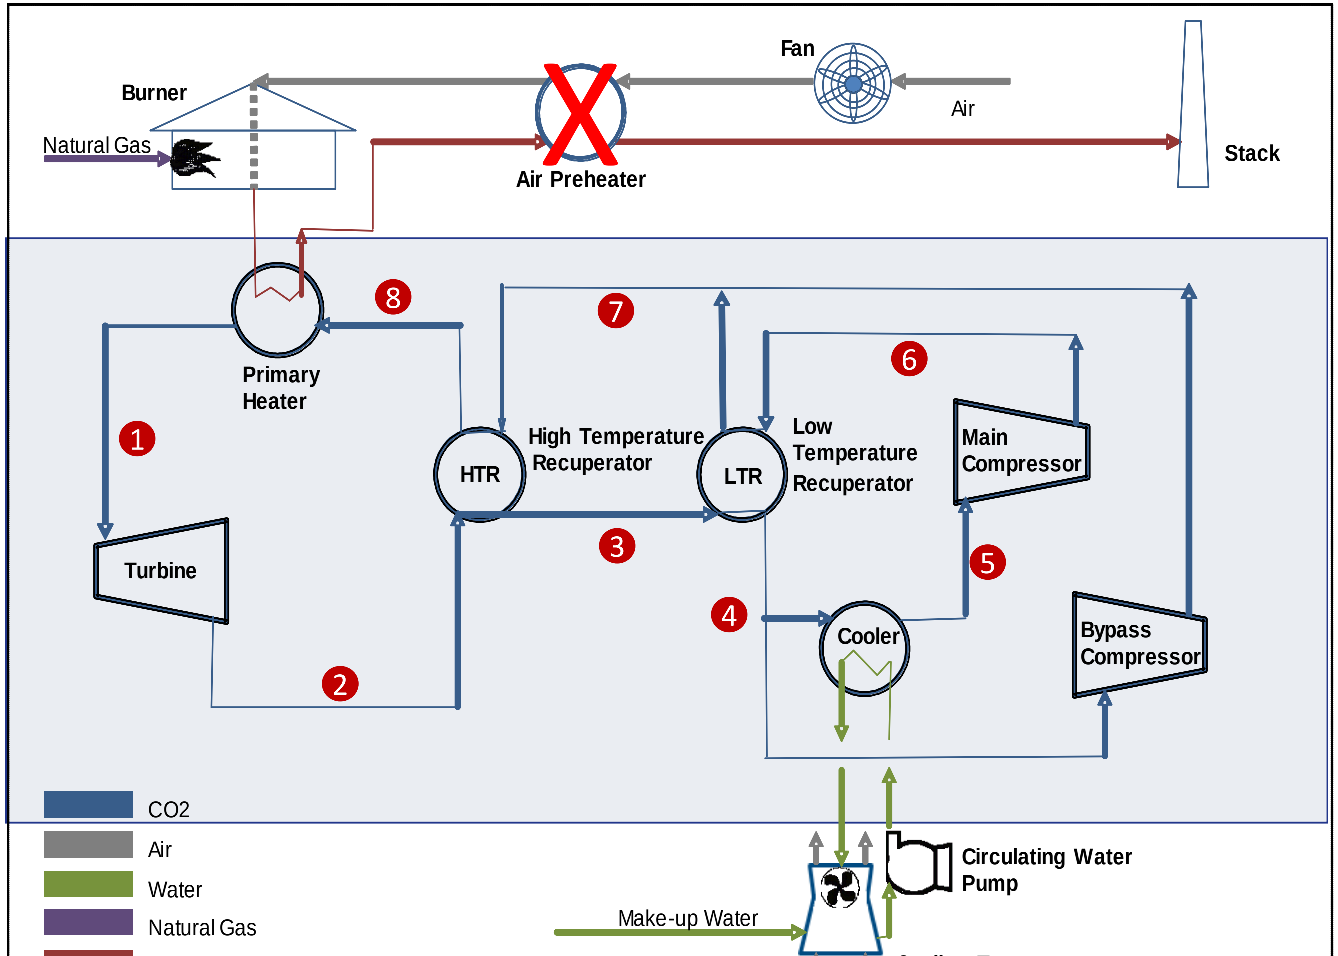
SEA PSER sCO_2 Cycle Modeling Activities

NATIONAL ENERGY TECHNOLOGY LABORATORY

- **Indirect Fired Cycles**
  - STEP pilot plant
    - Cycle models for dynamics
      - Recompression Closed Brayton Cycle (RCBC)
      - Simple Cycle – First year of facility operation, starting ~Oct 2020
    - Equipment models
      - Heat exchangers
      - Control of primary heat rejection water cooler
  - 550 MW commercial scale with circulating fluidized bed
    - Turbomachinery arrangement options
      - Off Design (Part-load, Ambient temperature) → Control
- **Direct Fired Cycle**

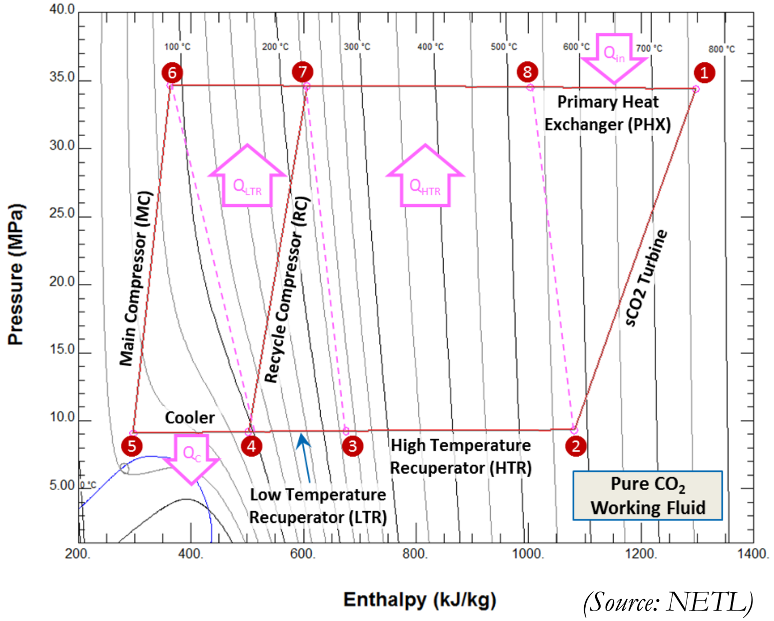
10 MWe sCO_2 Recompression Brayton Pilot Plant

Process Overview



(Source: NETL)

- External gas-fired heat source
- sCO_2 circulates in closed loop (noncondensing)
- Two stages of recuperation used to pre-heat compressed sCO_2 with hot turbine exhaust
- Cooler rejects heat that is not converted to power
- Coupled compressors, decoupled turbine expander



(Source: NETL)

Motivation

- **Understand control-related challenges of a MW scale sCO_2 Recompression Closed Brayton Cycle (RCBC)**
  - **Load changes**, Startup, Shutdown, Trips
  - Operation close to sCO_2 critical point
  - Maintain turbine inlet temperature during load changes (high efficiency)
  - Other operational constraints, e.g. surge/stonewall limits
- **Applicable to 10 MWe RCBC facility within Supercritical Transformational Electric Power (STEP) program**

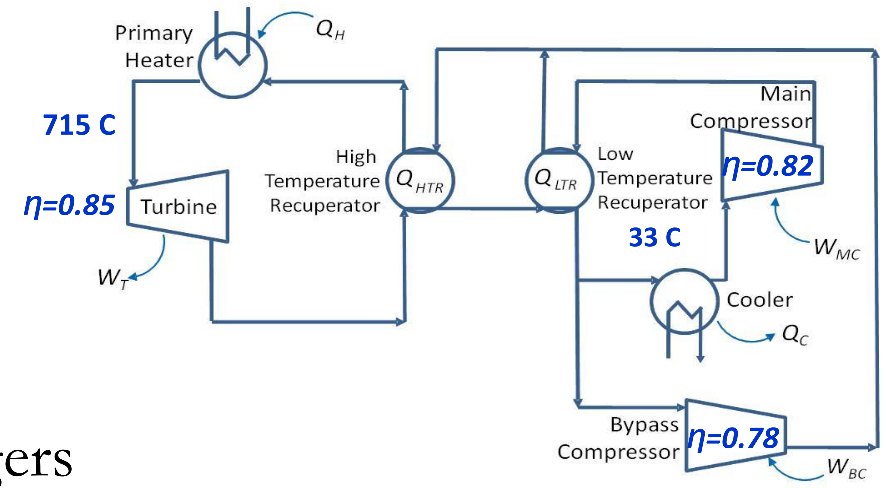
Presentation Overview

- **SEA PSER sCO_2 Activities Overview**
- **Motivation for Control Studies of STEP Facility**
- **Control Methodology**
  - Steady-State and Dynamic Simulation Framework
  - Control Objectives
  - Control Architecture
- **Control Response Results**
  - Ramp down and up in RCBC cycle MW demand
  - Heat rejection water cooler temperature control
- **Future Work**

Control Methodology

Steady-State and Dynamic Simulation Framework

NATIONAL ENERGY TECHNOLOGY LABORATORY



- **Software Tools**
  - Aspen Plus/Dynamics/Custom Modeler (ACM) v10.0
- **Property Method**
  - NIST REFPROP
- **Aspen Library Models**
  - Turbomachinery (currently), piping, some heat exchangers
- **Aspen Custom Modeler (ACM) Models**
  - ACM compact heat exchangers models - microtube[†] and printed circuit[††]
- **Dynamic Model of 10 MWe sCO_2 RCBC Pilot Plant[†††]**

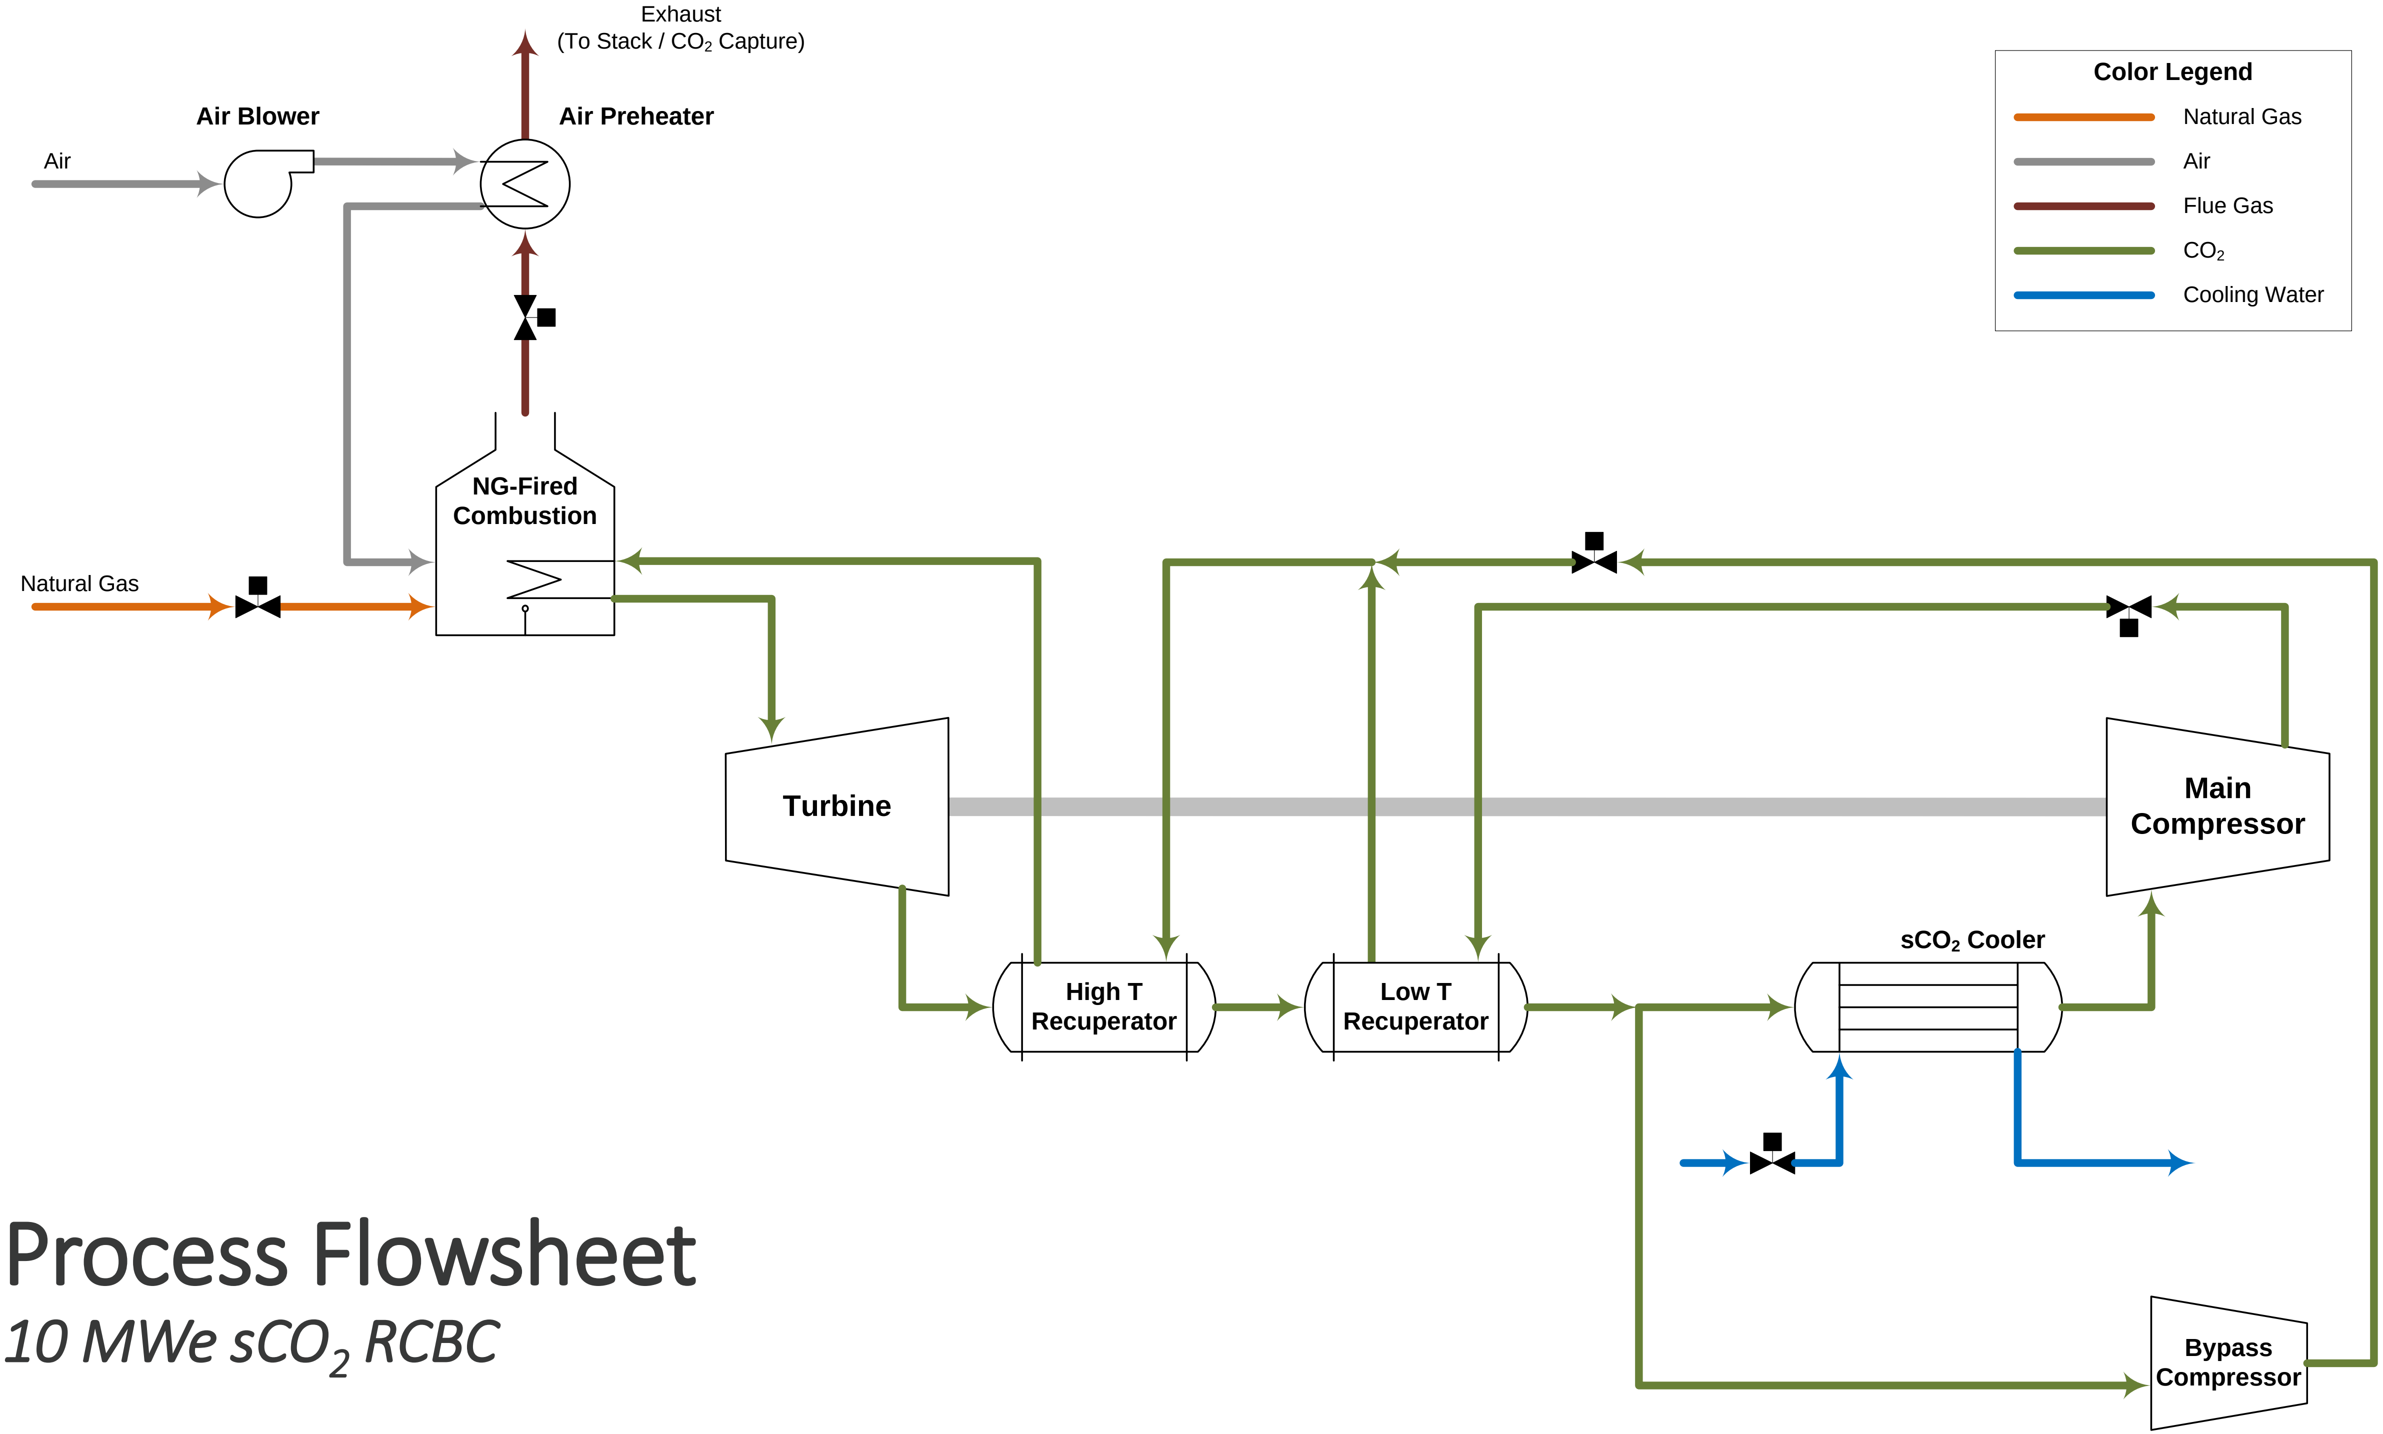
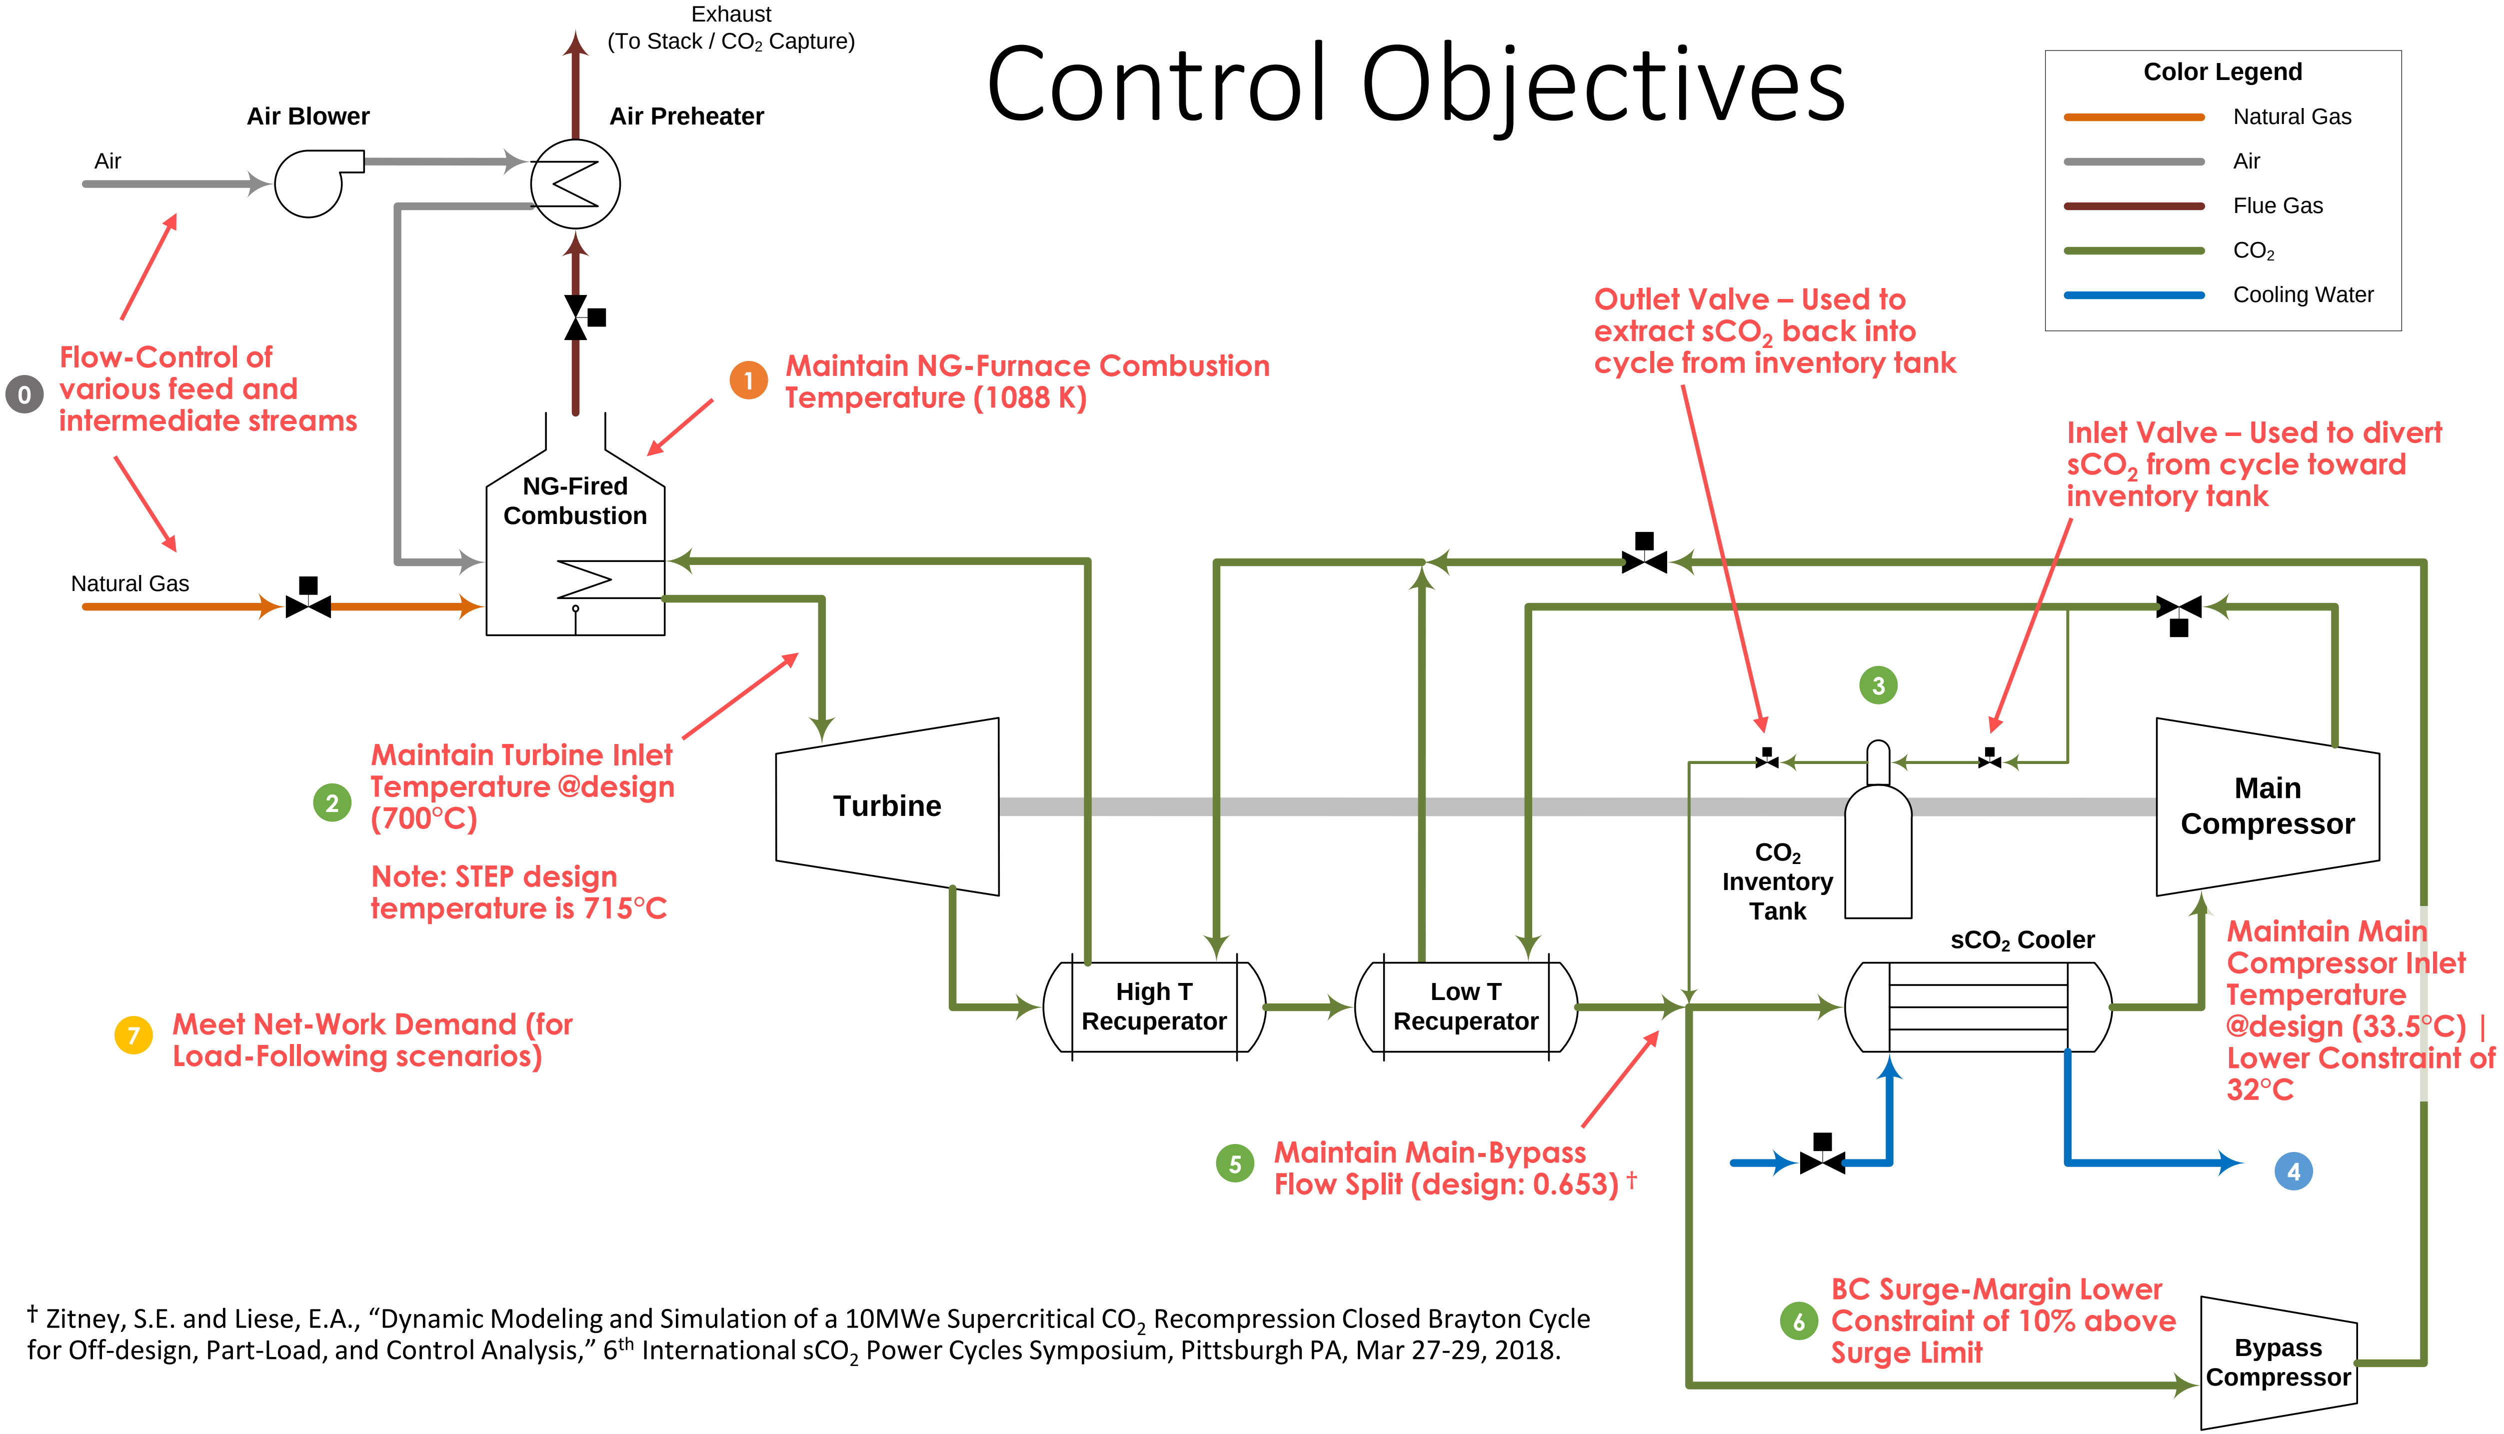
Process Flowsheet

10 MWe sCO_2 RCBC



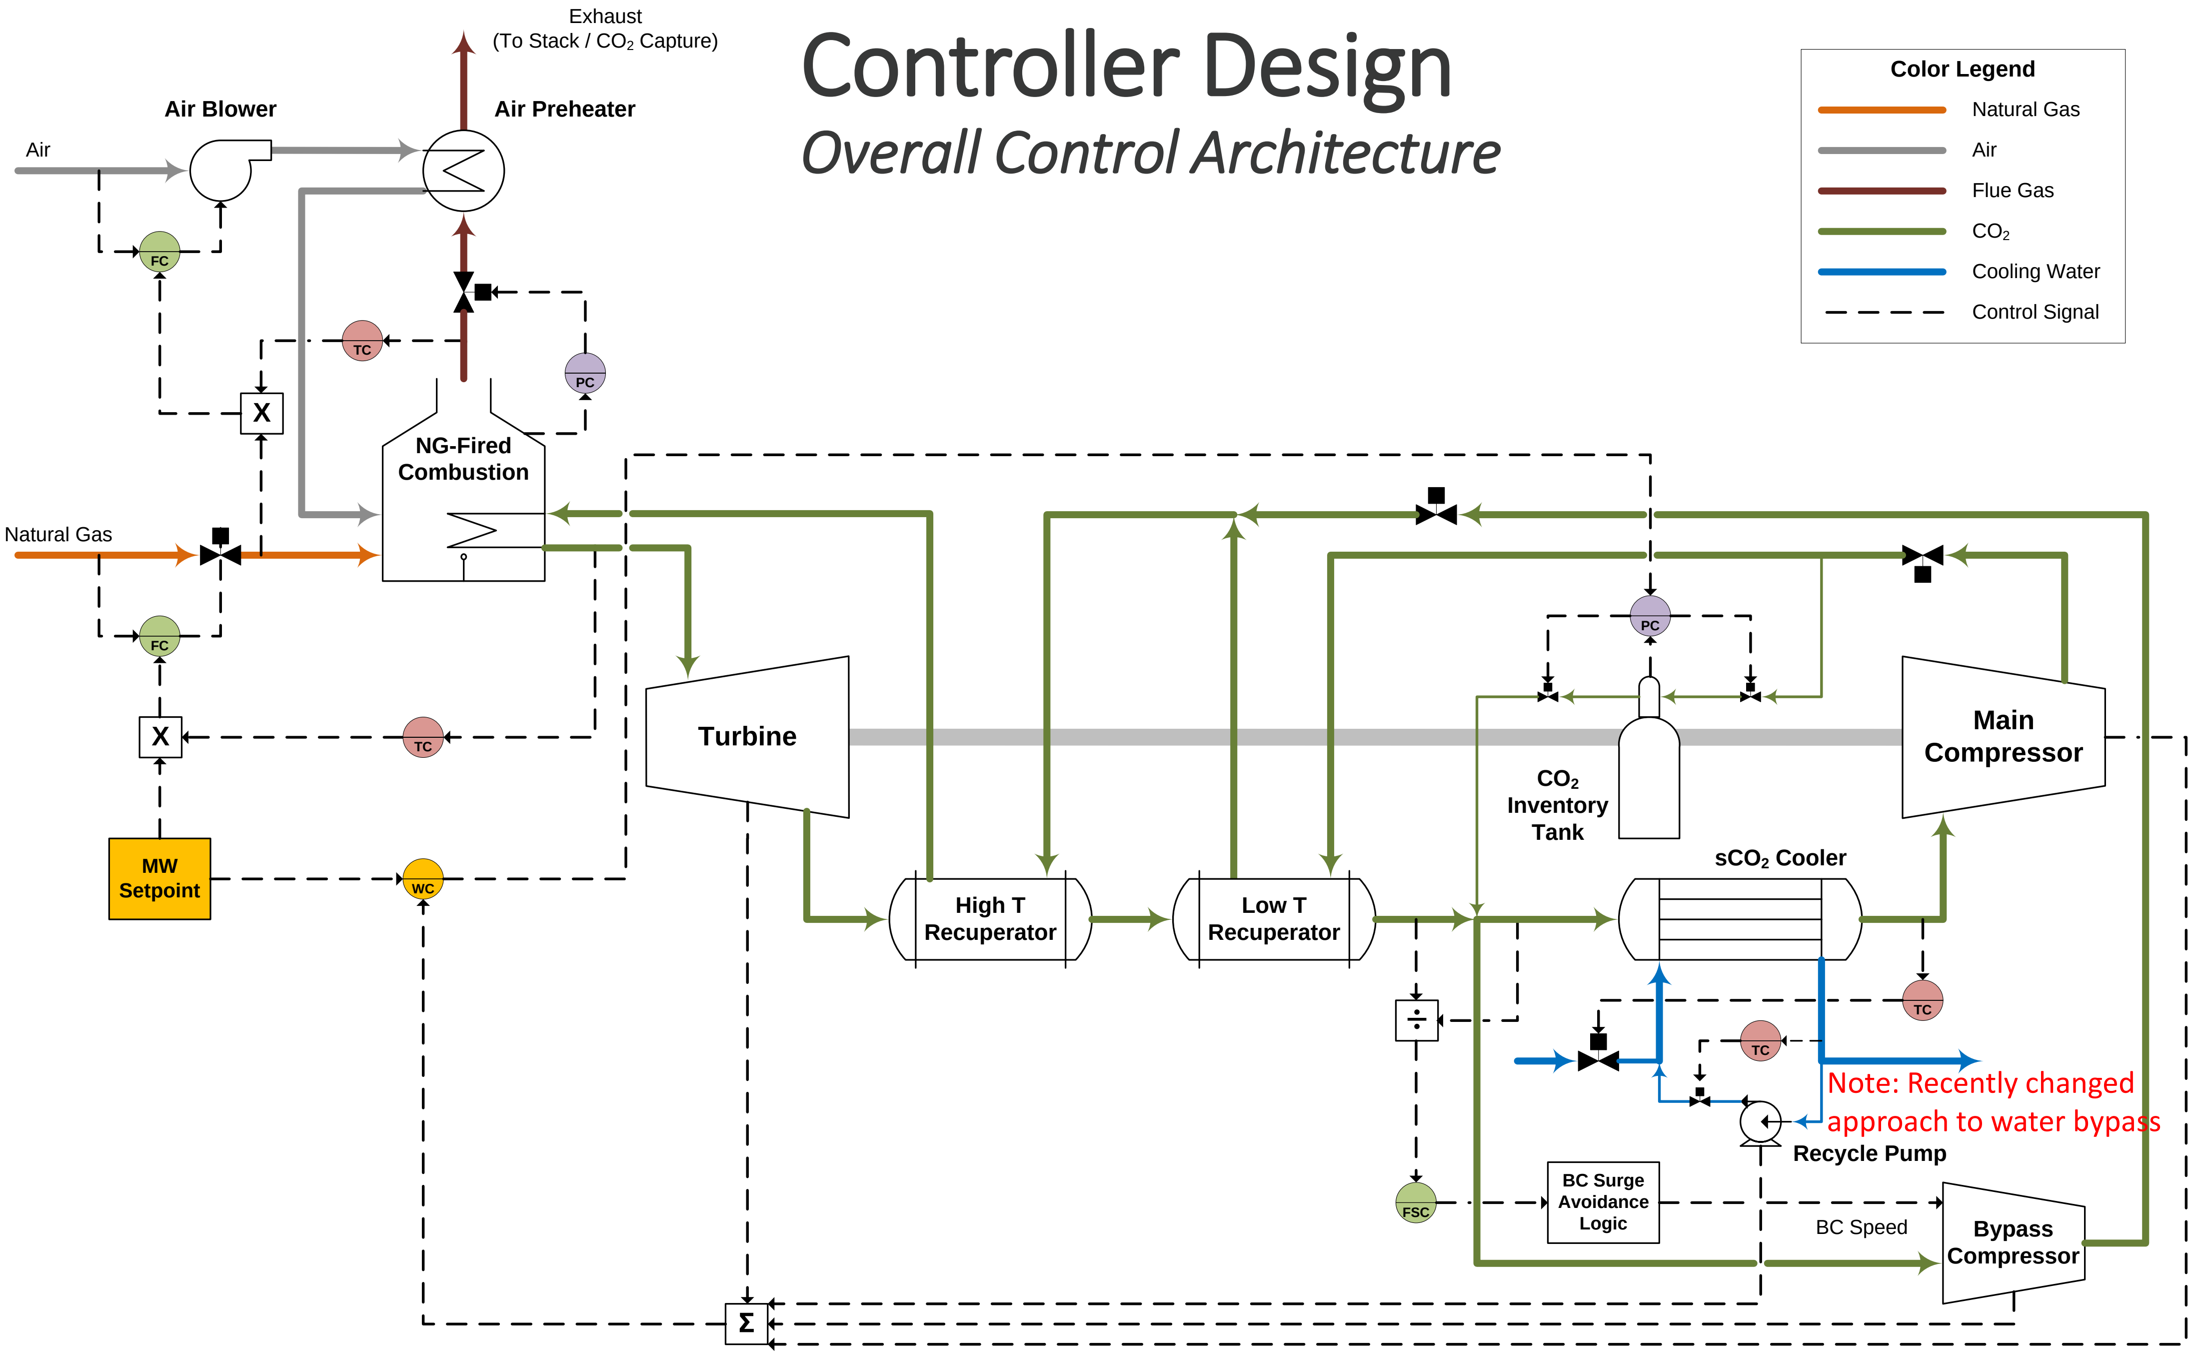
Control Objectives



† Zitney, S.E. and Liese, E.A., "Dynamic Modeling and Simulation of a 10MWe Supercritical CO_2 Recompression Closed Brayton Cycle for Off-design, Part-Load, and Control Analysis," 6th International sCO$_2$ Power Cycles Symposium, Pittsburgh PA, Mar 27-29, 2018.

Controller Design

Overall Control Architecture



Presentation Overview

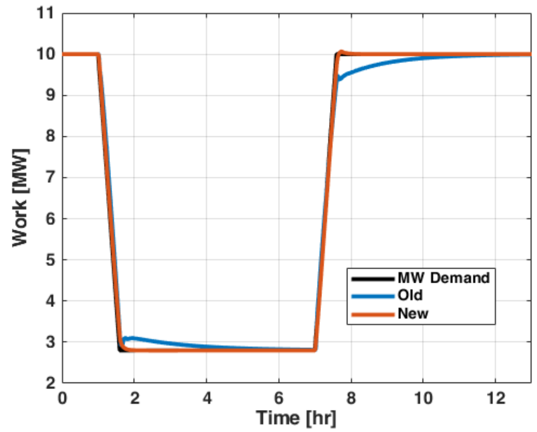
- **SEA PSER sCO_2 Activities Overview**
- **Motivation for Control Studies of STEP Facility**
- **Control Methodology**
  - Steady-State and Dynamic Simulation Framework
  - Control Objectives
  - Control Architecture
- **Control Response Results**
  - Ramp down and up in RCBC cycle MW demand
  - Heat rejection water cooler temperature control
- **Future Work**

Advanced Sensors & Controls Task 61: Control Strategies for a 10 MW sCO2 Power System

STEP Cycle Model Control Investigations

Technical Progress:

- Discussed previous NETL control studies and future interests with STEP development team (GTI, SwRI, GE)
- Implemented turbine inlet temperature control by manipulating external combustor and load setpoint tracking using inventory management control. Used microtube ACM models for high and low-temperature recuperators. Details in Aug 31, 2018 Milestone Report



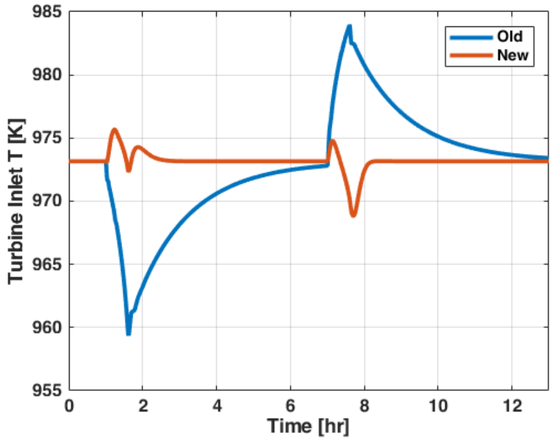


Figure Right: Response of inventory tank valves and system pressures to work ramps

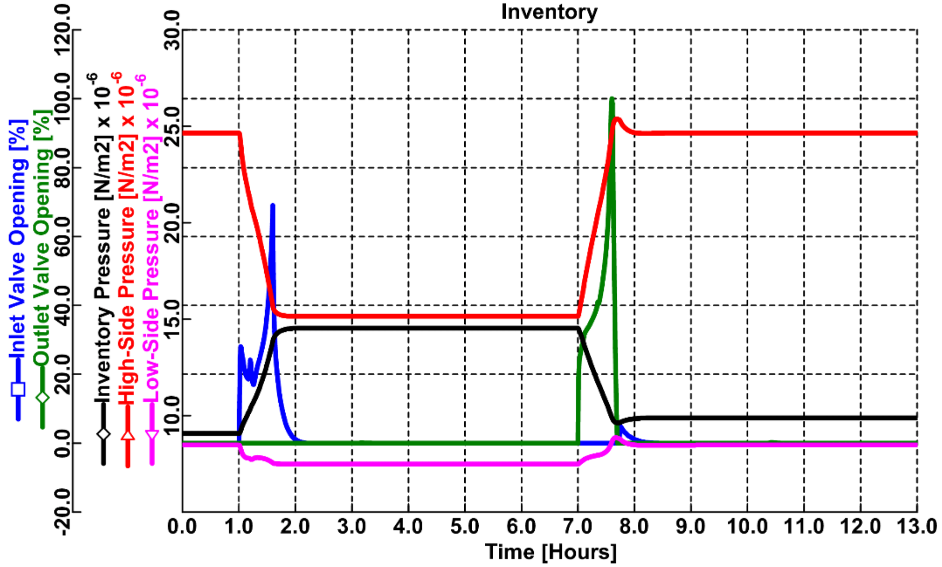


Figures Above: Updated control improves Work and Turbine Inlet Temperature setpoint tracking

Advanced Sensors & Controls Task 61: Control Strategies for a 10 MW sCO2 Power System

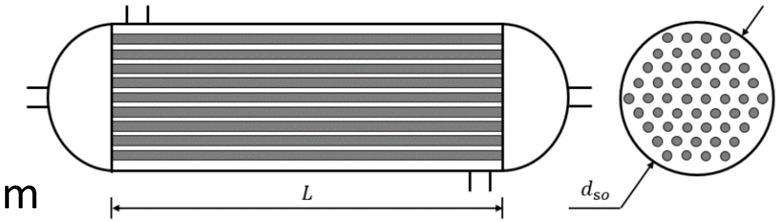
Water Cooler Studies for STEP

Objective: Analyze water cooler CO_2 temperature control approaches being considered for STEP. A 1°C change in this temperature can effect temperature at turbine inlet by 10°C (if uncontrolled)

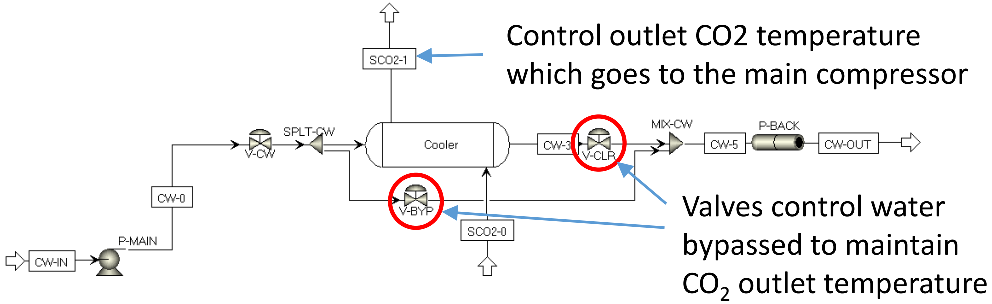
Technical Progress:

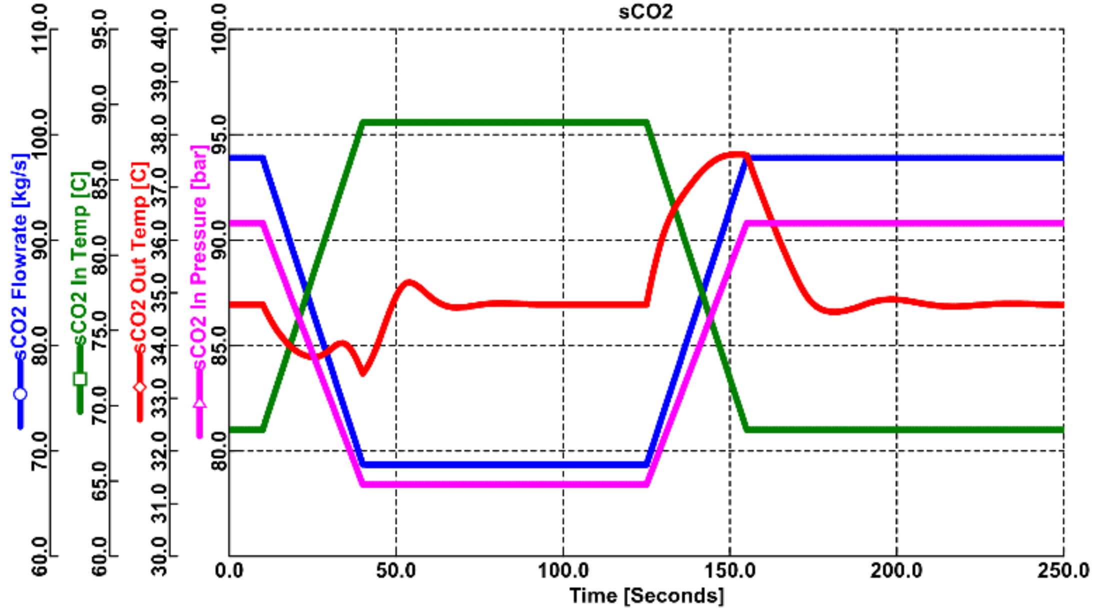
- Completed microtube type CO_2-water cooler 1D design and dynamic model using Aspen Custom Modeler

Shell OD 20 in.
11,000 tubes
Tube L 5 ft.
Tube OD 2.77 mm



- Performed control studies†.





Plot: Aggressive inlet CO_2 flow ramps (blue) of 1%/sec. Control of CO_2 outlet temperature (red) within 2.5°C of setpoint

- **Future Work**

Future Work

10MWe sCO_2 Recompression Brayton Cycle

- **Updating cycle model based on STEP design in progress**
  - Added pipe models and prelim turbomachinery performance maps including compressor inlet guide vanes
- **Simple cycle model development in progress**
- **Increase model fidelity with custom models using Aspen Custom Modeler (esp. heat exchangers)**
- **Numerous scenarios to investigate**
  - Startup, Shutdown, Trips…
- **Numerous control approaches to try**
- **Improve simulation robustness**
