

Open Source Software to Analyze  
Water Distribution System Resilience

87th Symposium  
Military Operations Research Society  
June 2019

Katherine Klise  
Sandia National Laboratories

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC., a wholly owned subsidiary of Honeywell International, Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

# Funding Agency and Team

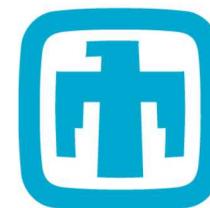

## Environmental Protection Agency

### Office of Research and Development

- National Homeland Security Research Center, Terra Haxton
- National Risk Management Research Laboratory, Regan Murray

## Sandia National Laboratories

- Discrete Math and Optimization, Michael Bynum, Carl Laird
- Geotechnology and Engineering, David Hart
- Water Energy System Integration, Katherine Klise

**Sandia  
National  
Laboratories**

# Motivation and Background

- Water distribution systems face multiple challenges
- The goal of a resilient system is to minimize the magnitude and duration of disruption
- Resilience of drinking water systems is influenced by
  - Design
  - Maintenance
  - Operations
  - Dependence with other infrastructure

Potential Hazards	Potential Impacts
Natural disasters <ul style="list-style-type: none"> <li>- Drought</li> <li>- Earthquake</li> <li>- Floods</li> <li>- Hurricanes</li> <li>- Tornados</li> <li>- Tsunamis</li> <li>- Wildfires</li> <li>- Winter storms</li> </ul>	Infrastructure damage <ul style="list-style-type: none"> <li>- Pipe breaks</li> <li>- Pump failure</li> <li>- Tank damage</li> </ul> Service disruption
	Loss of access to facilities/supplies
Terrorist attacks	Loss of pressure or change in water quality
Cyber attacks	Environmental impacts
Hazardous material release	Financial impacts
Climate change	Social impacts

## Risk and Resilience Management of Water and Wastewater Systems

Using the ASME-ITI RAMCAP Plus® Methodology

Effective date: \*\*\*, 2010.  
Approved by ASME \*\*\*\*.  
Approved by AWWA Board of Directors \*\*\*.  
Approved by American National Standards Institute \*\*\*.

# Utility Specific Questions

- What type of infrastructure damage could be caused by:
  - A magnitude 7 earthquake (e.g., Napa Valley, CA)?
  - A hurricane (e.g., Harvey in TX, Maria in PR)?
  - A regional power outage (e.g., Northeast Blackout)?
  - A contamination incident (e.g., Flint MI, Elk River Spill in WV)?
  - A tornado (e.g., Joplin, MO)?
- How long can the system continue to provide water to customers?
- How many people will be impacted?
- What is the best response in the immediate aftermath?
- Which components should be hardened to minimize future disruptions?

# Infrastructure Resilience Policy

## Installation Energy and Water Security Policy (Army Directive 2017-07)

- Establish energy and water infrastructure requirements that ensure continuous availability, reliability and quality.
- Preparation for extended outages, providing necessary energy and water for a minimum of 14 days
- Microgrid/islandable capabilities

## America's Water Infrastructure Act (AWIA, 2018)

- Requires drinking water systems serving more than 3,300 people to develop
  - Comprehensive water system risk and resilience assessment
  - Emergency response plans that address physical and cybersecurity threats
- Drinking Water Infrastructure Risk and Resilience Program: EPA may award grants to increase the resilience of community water systems

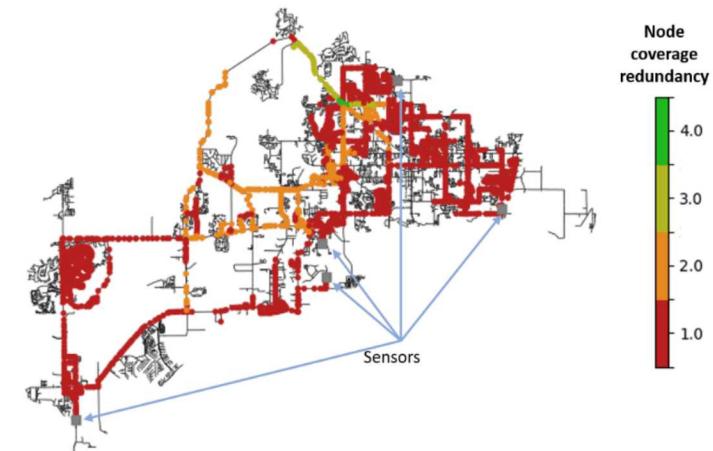

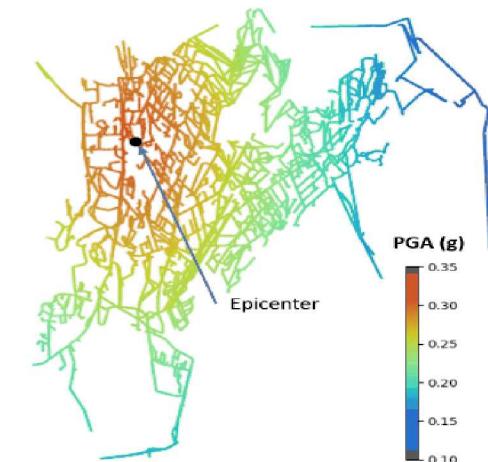

# Water Network Tool for Resilience

WNTR is designed to analyze water distribution network failure and recovery

- Quantify resilience for a wide range of hazards
  - Pipe breaks
  - Power outages
  - Contamination incidents
  - Earthquakes
  - Landslides
  - Hurricanes
  - Cyber attacks
- Evaluate and prioritize resilience-enhancing actions
  - Isolate and repair pipe breaks
  - Change valve and tank operation to maintain water service
  - Install backup generation
  - Plan flushing or water conservation mandates
  - Evaluate sampling locations
  - Evaluate fire fighting capacity

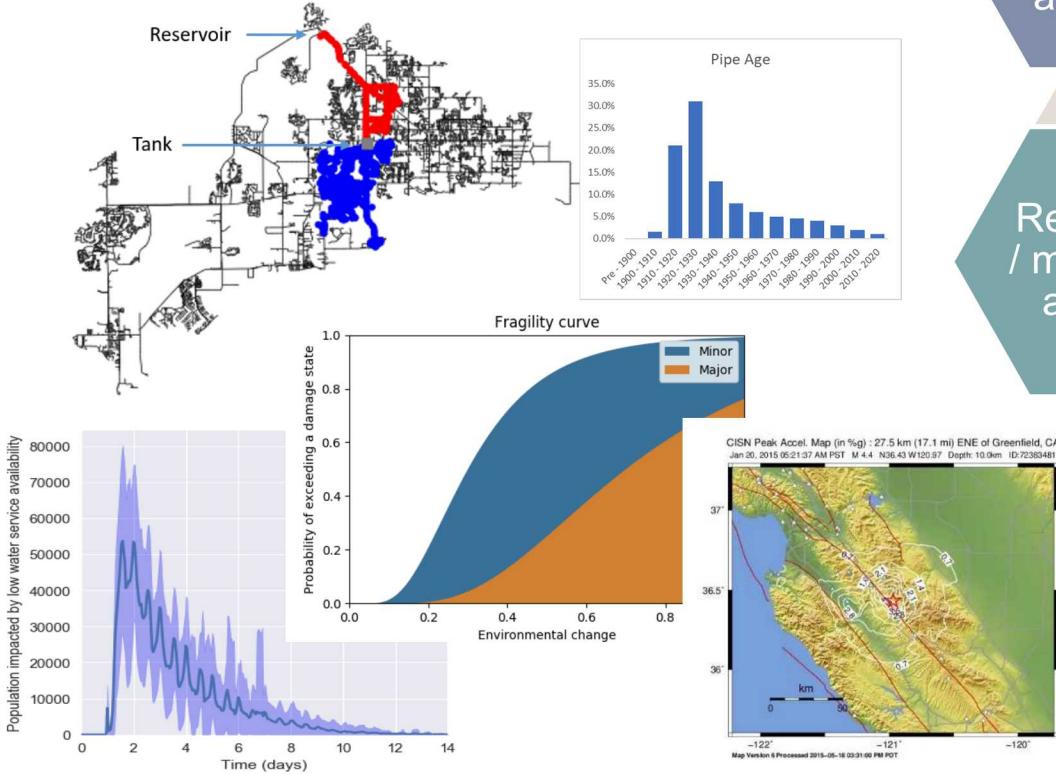

# WNTR

Water Network Tool for Resilience

# WNTR Framework

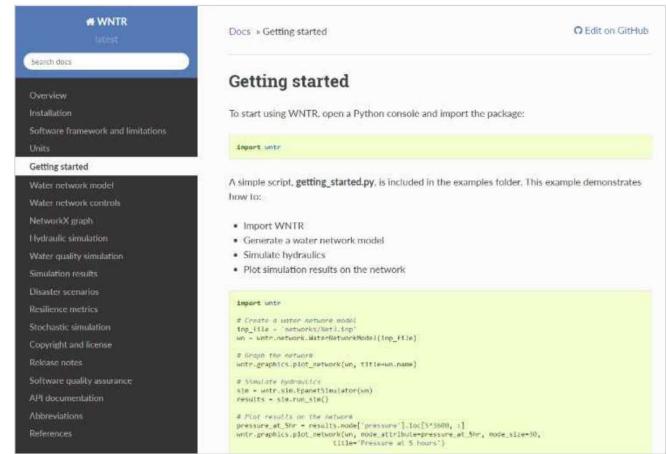

- **EPANET** is the industry standard for water distribution hydraulic and water quality modeling
- The Water Network Tool for Resilience, **WNTR**, builds on capabilities in EPANET to analyze water distribution resilience

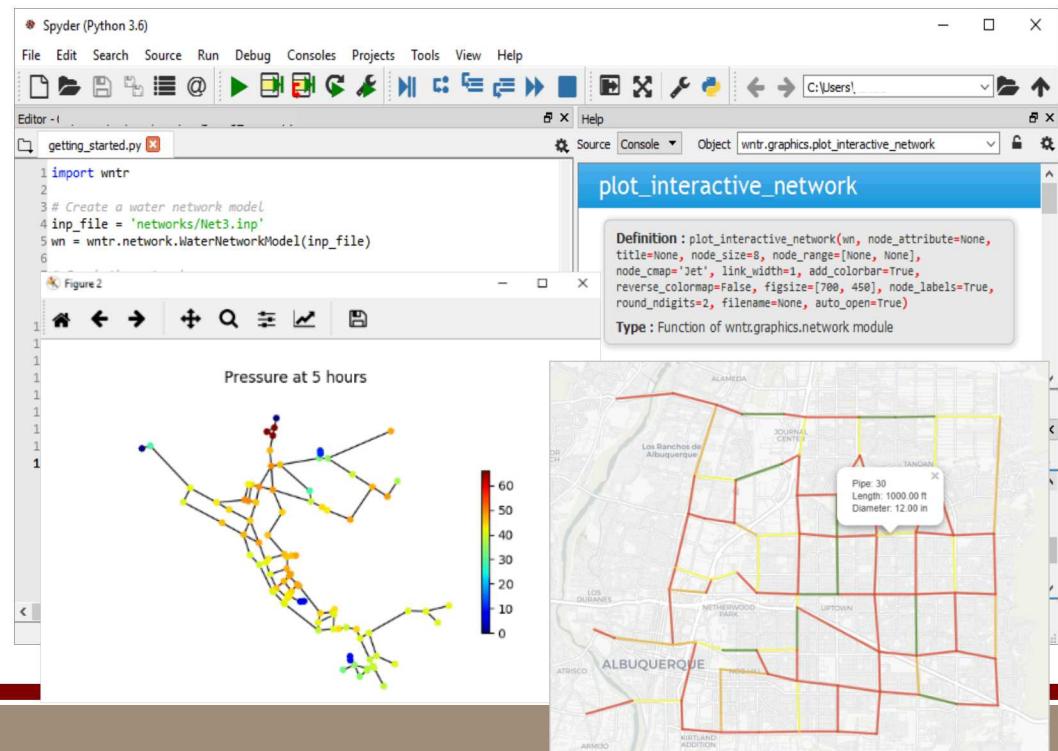

<https://github.com/usepa/wntr>

# WNTR Framework

- Open source Python package
  - Python 2/3 compatible
  - Integrated development environments
- Integrates commonly used efficient Python packages
  - Numpy and Scipy
  - Pandas
  - NetworkX
  - Matplotlib, Plotly, and Folium
- Git repository, extensive online testing and documentation
  - GitHub
  - TravisCI
  - ReadtheDocs

The screenshot shows the WNTR documentation website. The left sidebar contains a navigation menu with links to Overview, Installation, Software framework and limitations, Units, Getting started, Water network model, Water network controls, NetworkX graph, Hydraulic simulation, Water quality simulation, Simulation results, Disaster scenarios, Resilience metrics, Stochastic simulation, Copyright and license, Release notes, Software quality assurance, API documentation, Abbreviations, and References. The main content area is titled 'Getting started' and contains instructions to start using WNTR by opening a Python console and importing the package. It includes a code snippet for generating a water network model, simulating hydraulics, and plotting results. A note says a simple script, `getting_started.py`, is included in the examples folder.

The screenshot shows the Spyder Python 3.6 IDE with a code editor containing `getting_started.py` and a plot window titled 'Figure 2' showing 'Pressure at 5 hours'. The plot displays a network of pipes with colored nodes representing pressure levels. A color bar on the right ranges from 0 to 60. A tooltip on the plot shows 'Pipe: 30 Length: 100.00 ft Diameter: 12.00 in'. Below the plot is a Folium map of an Albuquerque area with a legend and a tooltip for a pipe segment.

# Water Network Models

- Model contains physical layout and system operations
  - Nodes: Junctions, Tanks, Reservoirs
  - Link: Pipes, Valves, Pumps
  - Demands
  - Controls
  - Simulation options
- Generate network models from EPANET INP files or from scratch
- Add/remove/modify components
- Query node/link attributes
- Skeletonize network models
- Plot network attributes
- Analyze network structure

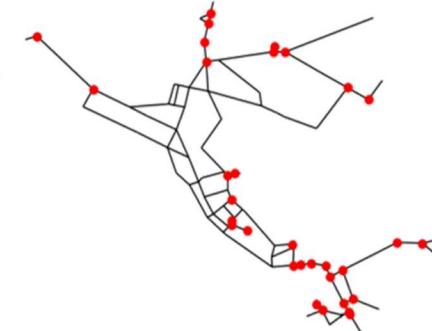

Original network

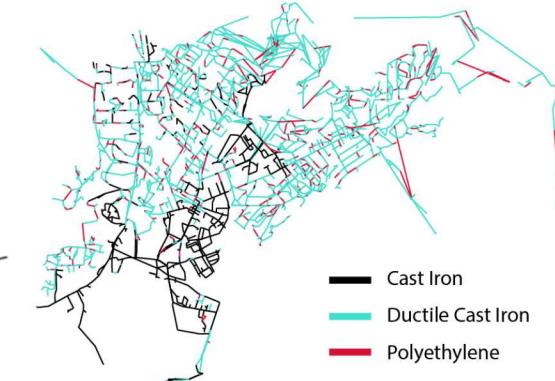

Skeletonized network

Articulation points

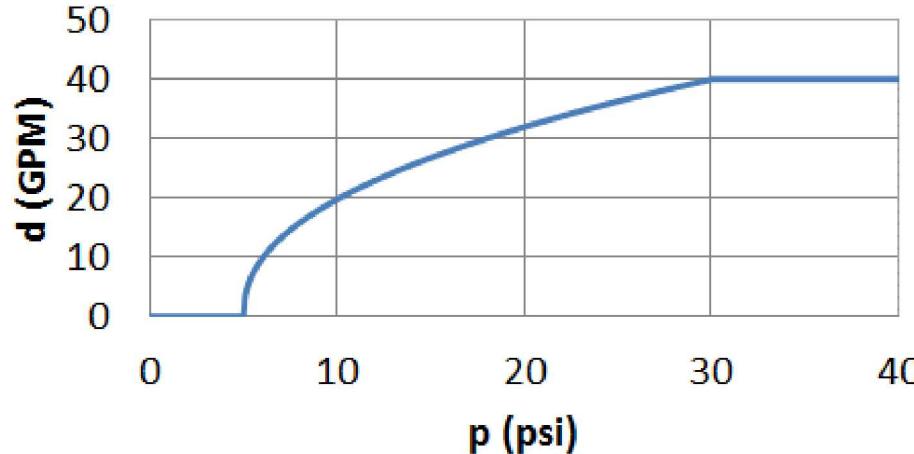

Pipe Material

# Hydraulic and Water Quality Simulation

- Demand-driven hydraulic simulation
- Pressure dependent demand hydraulic simulation
  - Demand at a node depends on the pressure that is available at the node

$$\begin{aligned} d &= D_f && \text{for } p \geq P_f \\ d &= D_f \left( \frac{p - P_o}{P_f - P_o} \right)^{1/e} && \text{for } P_o < p < P_f \\ d &= 0 && \text{for } p \leq P_o \end{aligned}$$

- Water quality simulations that compute water age or concentration
- Simulation start/stop capabilities
- Feedback loops, cascading failure
- Monte Carlo simulation
- Parallelization

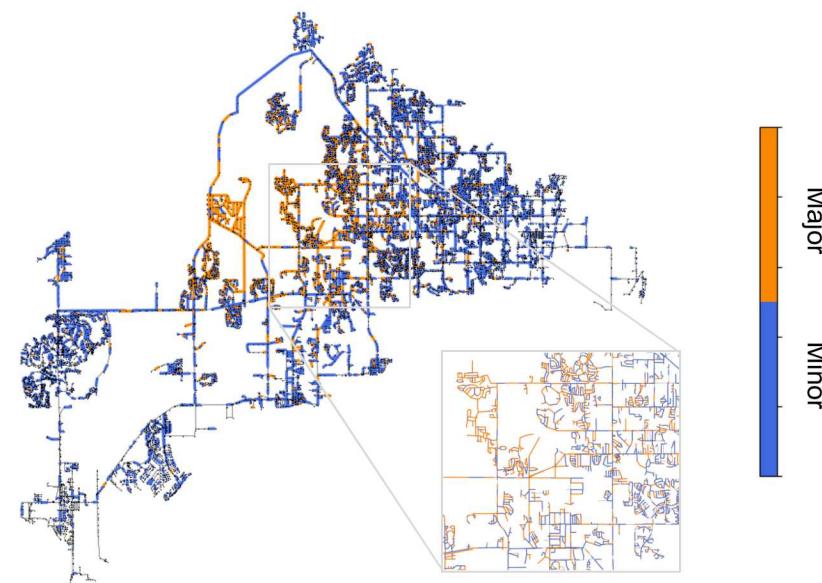

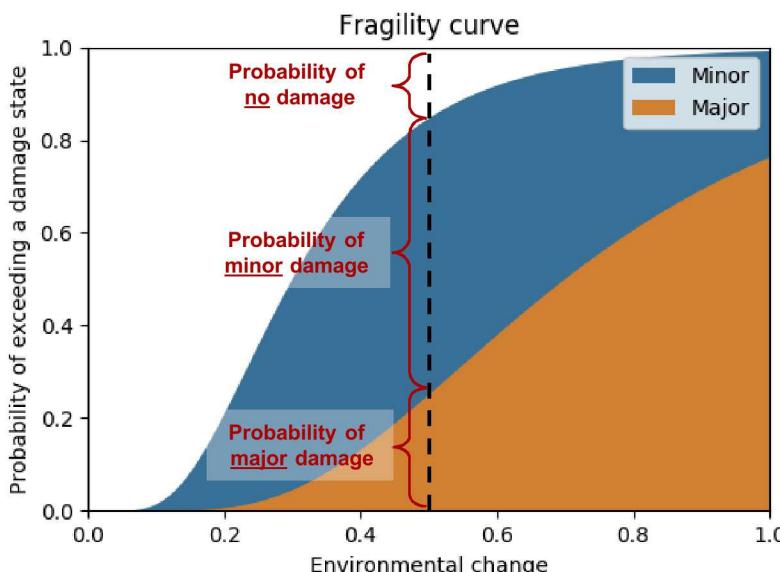

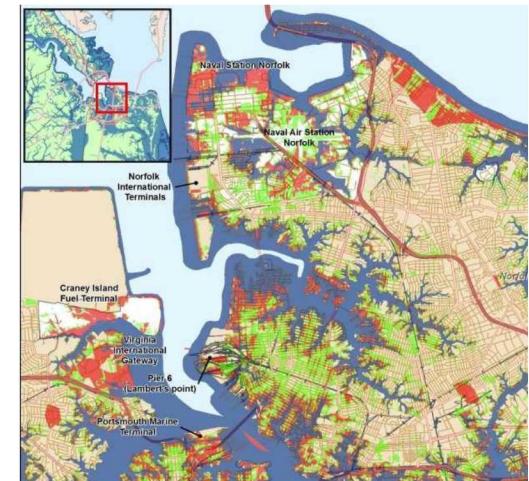

# Modeling Disruptive Incidents

- Define disruptive incident
  - Informed by data or a model
- Define probability of damage
  - Fragility and survival curves
- Modify the model
  - Controls, demands, components, attributes to match each scenario

PGA after an earthquake in California (USGS)

100-yr flood stage with sea level rise in Virginia (100RC)

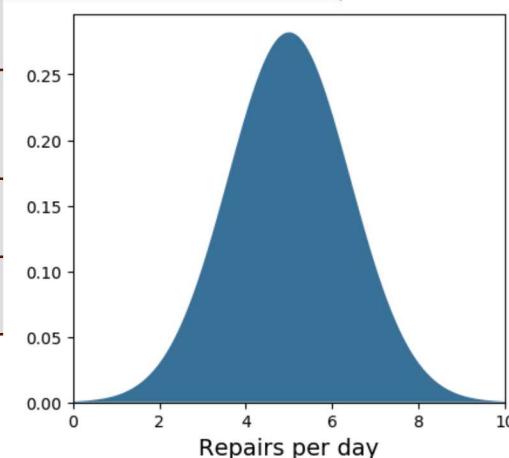

# Modeling Restoration Actions

- Define the restoration action
  - Type of repair actions
  - Number of crews
  - Time to repair
  - Supply chain
- Define priorities
  - Distance from the reservoir
  - Magnitude of leak
  - Number of people affected
- Modify the model
  - Controls, demands, components, attributes to match each scenario

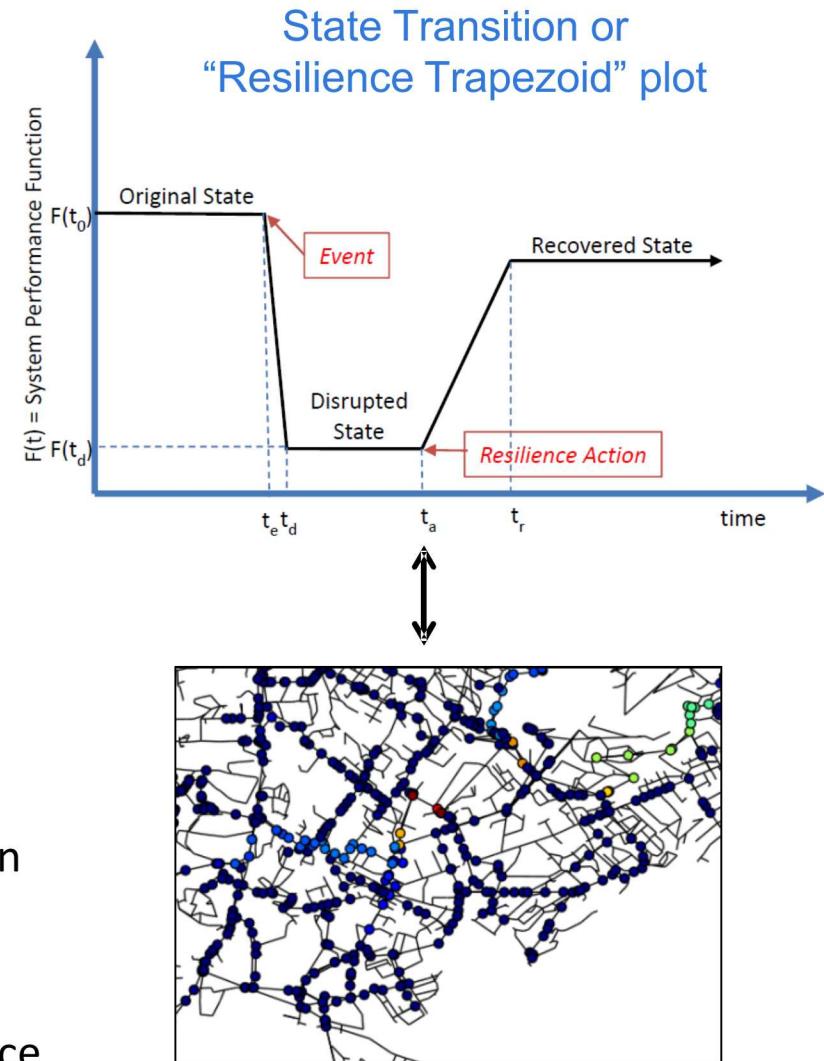

Repair Strategy Following 2014 Napa Valley Earthquake
Number of repair crews – 5
Repairs per day – 5 <i>(120 breaks fixed in 5 days)</i>
Repairs started 24 hours after earthquake
Separate team repaired tank
Prioritized repairs by proximity to limit travel time
Production maximized to feed leaks
Boil water order for affected regions

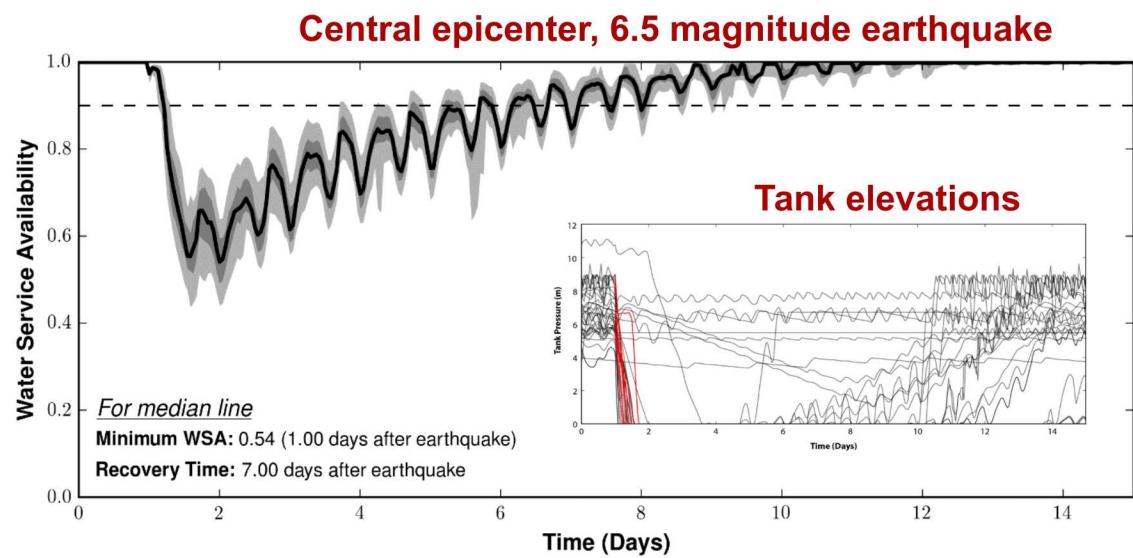

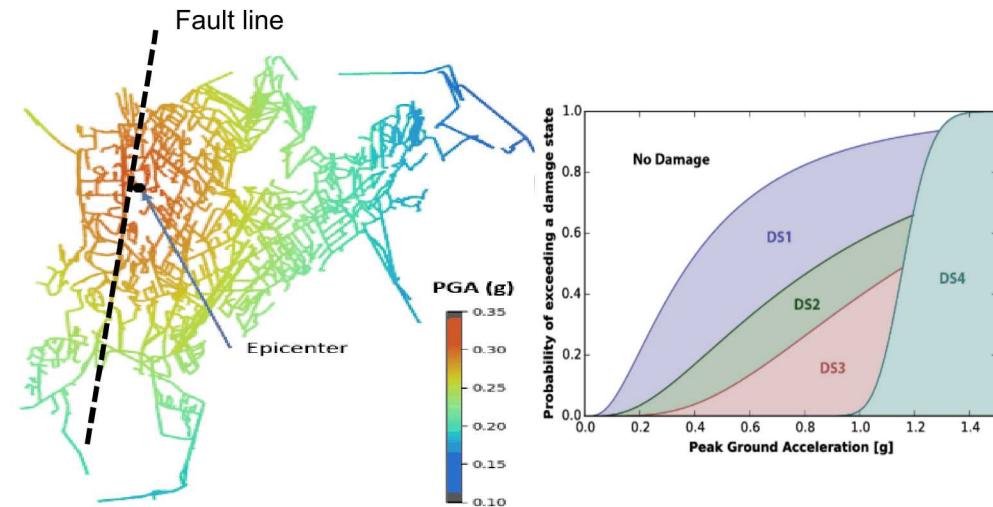

# Quantifying Resilience

- Numerous metrics have been suggested to quantify reliability, robustness, redundancy, and security for water distribution networks
  - Topographic metrics
  - Hydraulic metrics
  - Water quality metrics
  - Economic metrics
- Commonly used metrics include
  - Water service availability
  - Population impacted by service disruption or low pressure conditions
  - Water age and chlorine residual
  - Cost associated with repair and lost service

# Earthquake Analysis

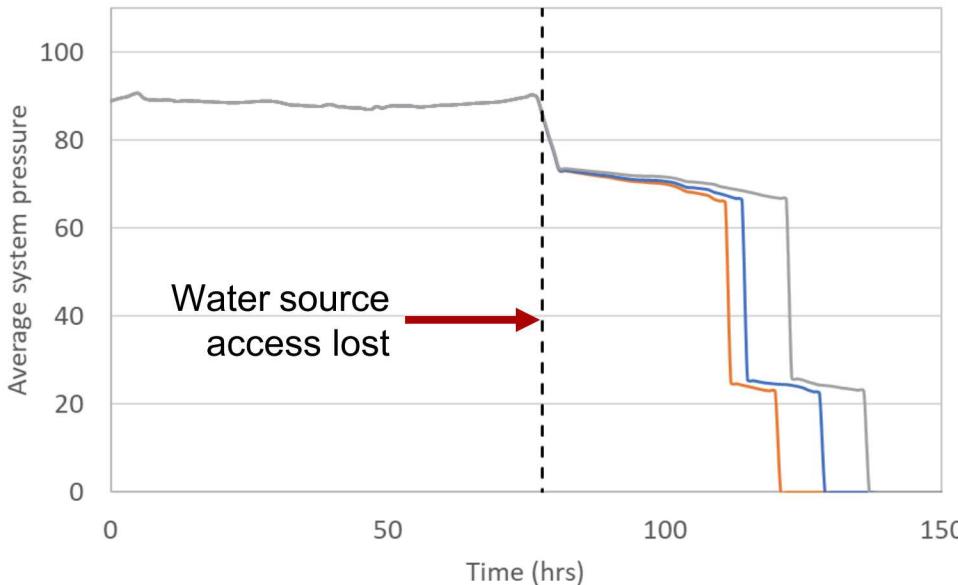

- Based on 2014 Napa Earthquake
- Assess water service availability and fire fighting capacity following an earthquake along a NS fault that bisects a water utility
- Damage a function of soil type, pipe material, and PGA using fragility curves
- Repair strategy
  - Separate pipe, tank, and pump repair crews
  - Prioritization for largest leak and pumps closest to the reservoir

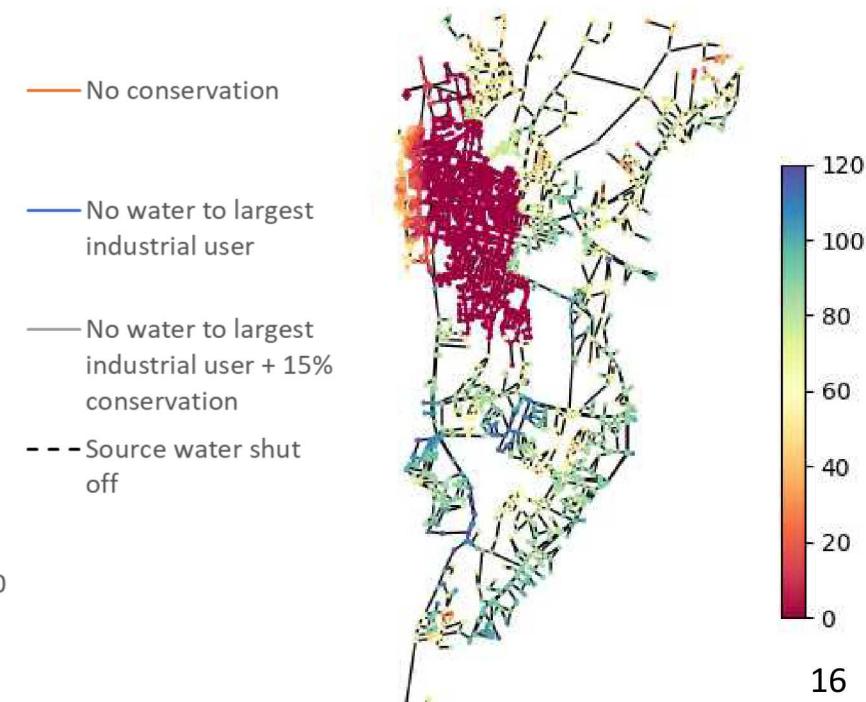

# Compromised Source Water Analysis

- Case study with the City of Poughkeepsie, NY
- Loss of source due to river contamination, treatment plant failure, winter storm freezing intake, or power outage.
- Track water pressure and water service availability over time
- Test mitigation strategies

Average system pressure over time

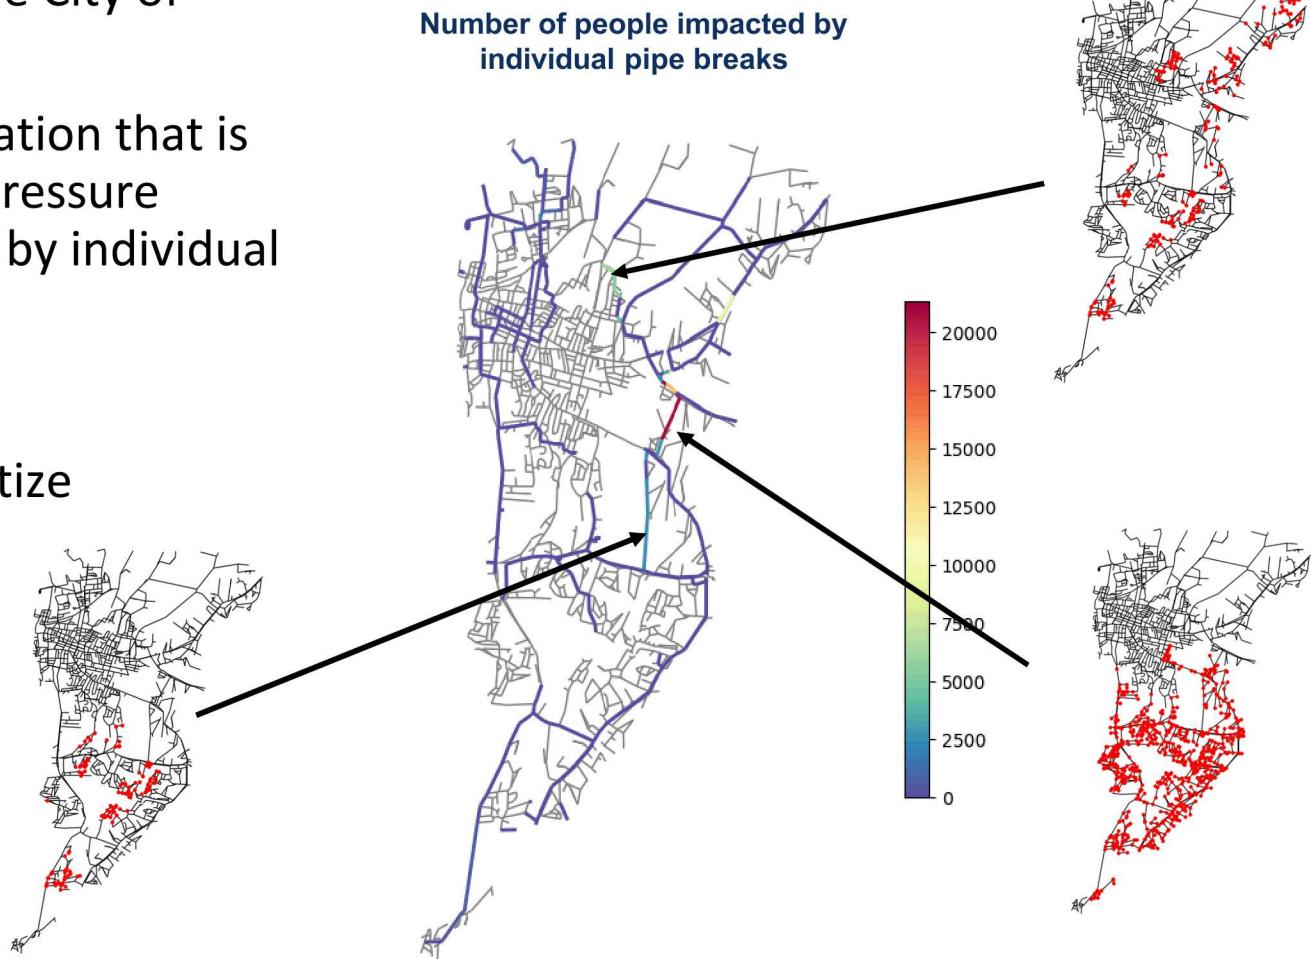

Node pressure (psi), Hour 120

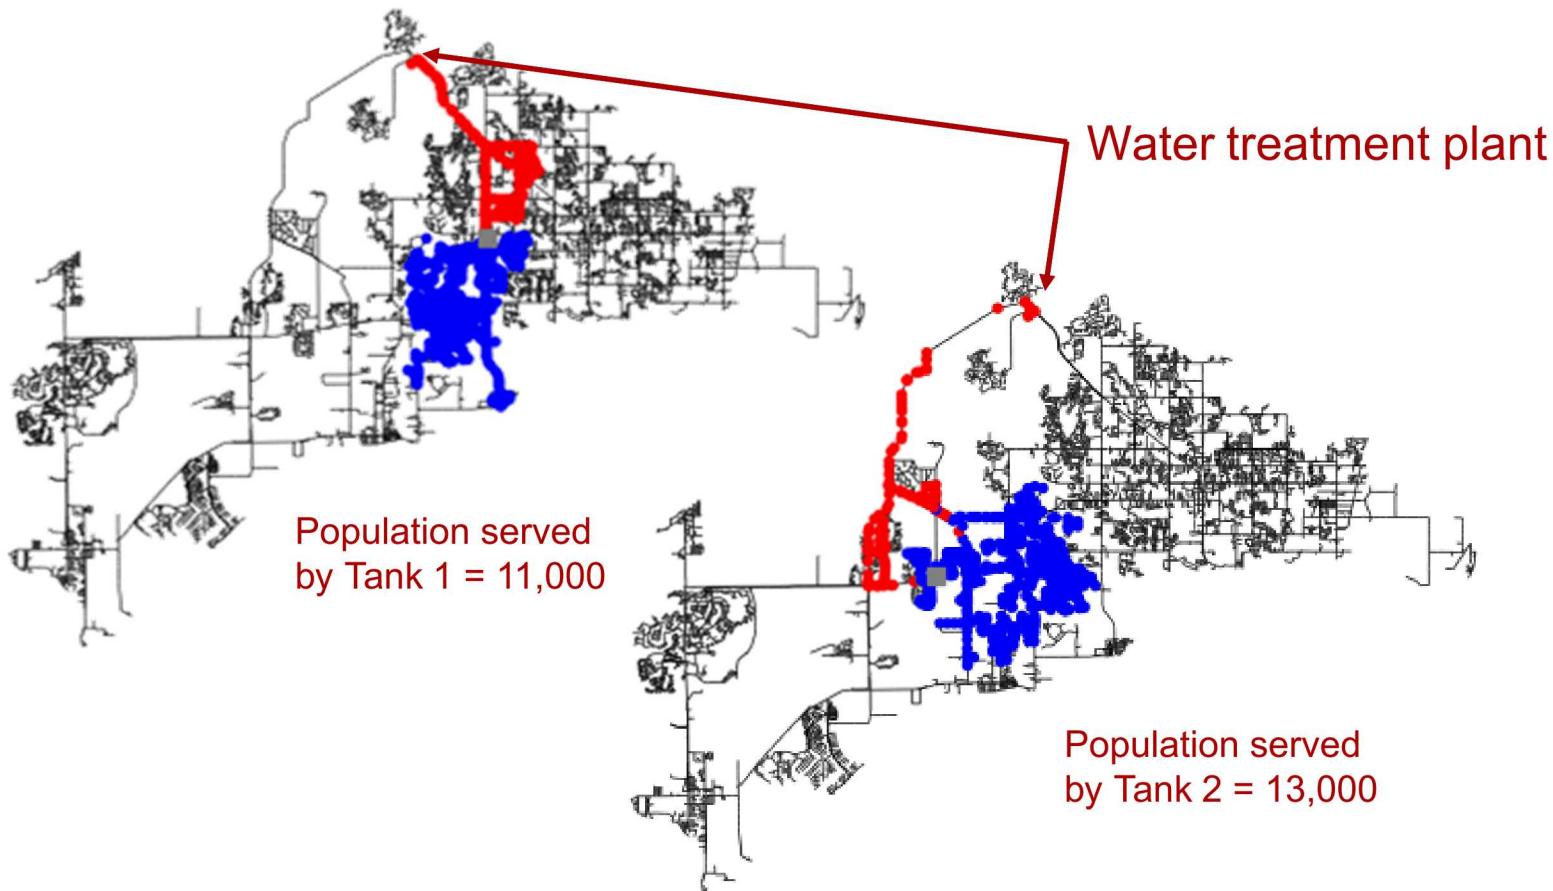

# Pipe Criticality Analysis

- Case study with the City of Poughkeepsie, NY
- Identify the population that is impacted by low pressure conditions caused by individual pipe breaks
- N-1 analysis
- Results help prioritize investment

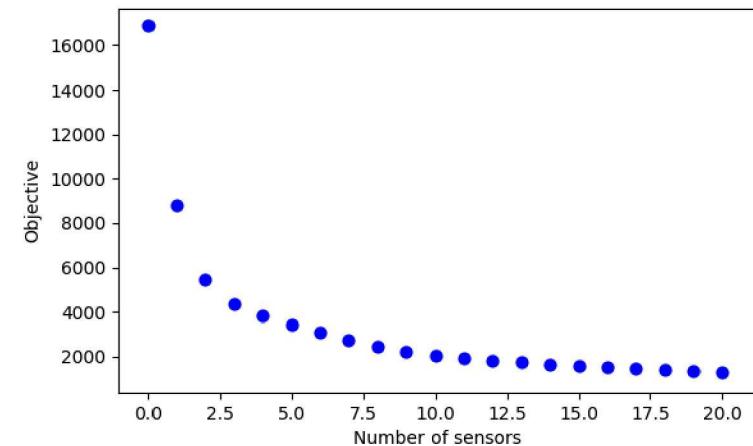

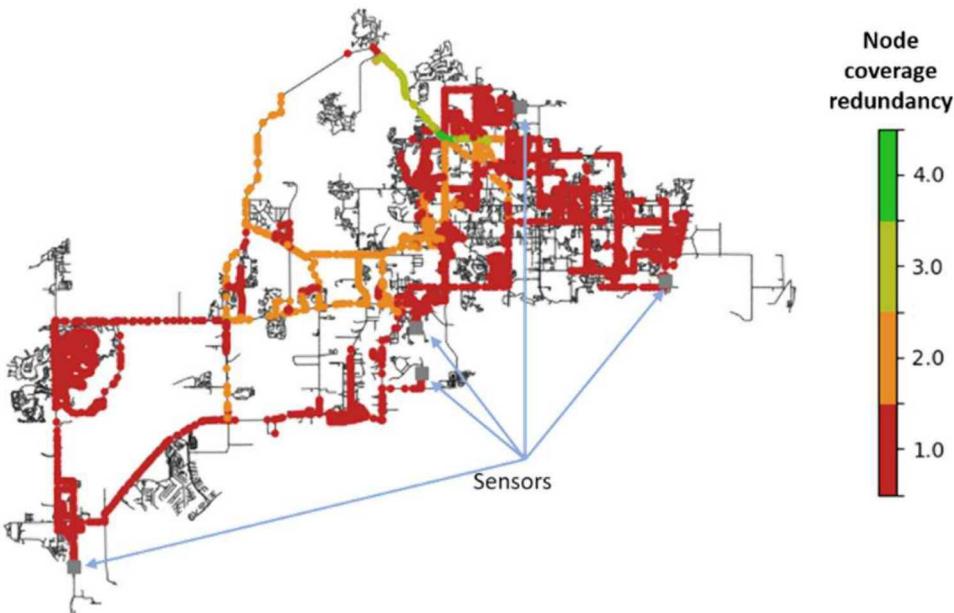

# Hydraulic Connectivity Analysis

- Compute location of all upstream and downstream nodes
- Evaluate critical paths between water treatment plant and customers

# Sensor Placement Optimization

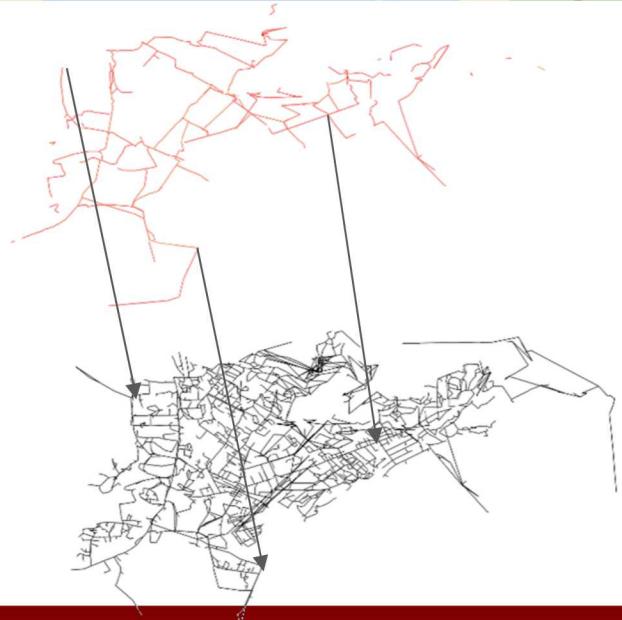

- Optimize the location of online sensors to minimize damage or maximize detection capabilities
- Evaluate redundancy of sensor locations
- Related open-source Python packages, developed at Sandia: Pyomo and Chama

<https://github.com/Pyomo>  
<https://github.com/sandialabs/chama>

# Infrastructure Dependency

- Resilience of the water system is highly dependent on other sectors, including
  - Electricity grid
  - Natural gas
  - Transportation network
  - Cyber, communication
  
- Resilience analysis applied across multiple infrastructures
  - Data analytics
  - Sensor placement
  - Simulation and optimization
  - Resilience and risk assessment
  - Microgrid/islanding capabilities
  - Capacity expansion
  - Emergency response plans

# Conclusions

- Sandia and the EPA are developing a wide range of capabilities to help water utilities do a “deeper dive” into understanding the resilience of their drinking water system
- By integrating hydraulic models and resilience metrics, water utilities can quantify the benefit of response actions and long-term mitigation strategies
- Open-source software makes these methods available to a wide audience
- Water utilities are invited to work with Sandia and the EPA on case studies
