

INTEL NUC – (p)HPC SECURE STANDALONE

PRESENTED BY

Victor Kuhns 9328 – Systems Architect

March 6th, 2019

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

Initial Motivation

- Teach HPC to new generations [STEM]

Personal Desktop HPC

- Functions identically (User/Administrative) to capacity clusters
- Minimal training
- Low power
- Low budget

Full Control and Scheduling of small core workloads on the Desktop

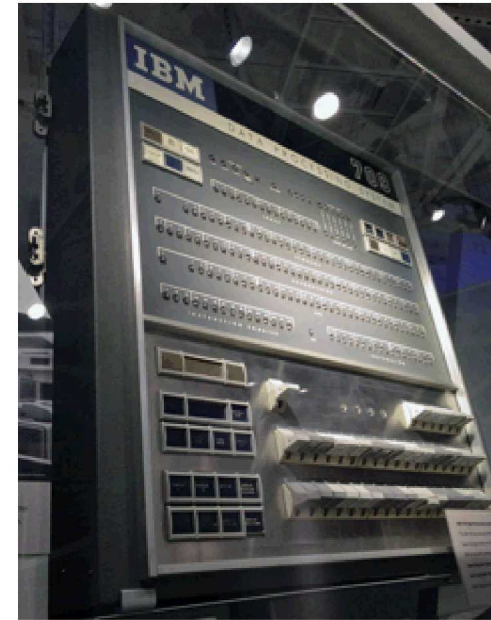

- Solidifies R&D work schedule from inconsistent submission times on Capacity clusters
- Affords relief from Capacity cluster resource contention by moving small core workloads to the Desktop

Secure, Scalable Standalone Computing

- No requirement for corporate network
- Does not require Systems Administrator
- Functional in multiple environments
- Compartmentalized
- Run anywhere

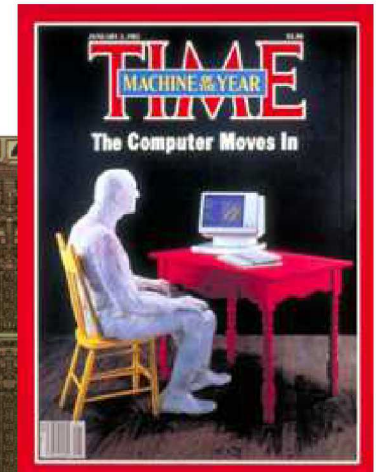

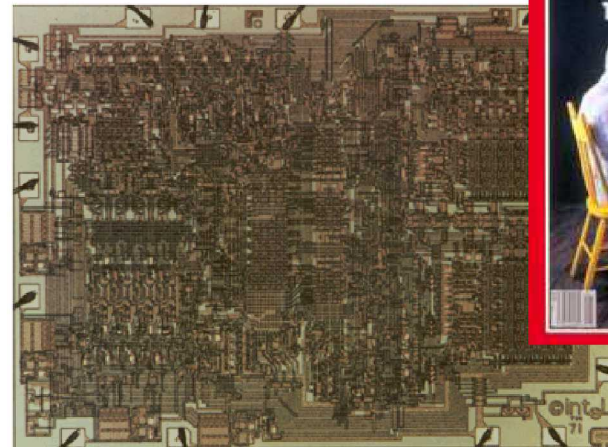

Mainframe

- 1970 – IBM 709
 - 42,000 Addition/Subtraction OPS
 - \$2.6 Million
- 100-250 kW for operation and almost as much for cooling

PC – Microprocessor

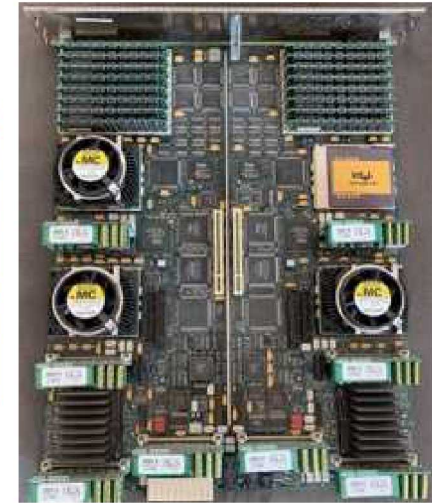

- Intel 4004
 - 92,600 OPS
 - \$5
- Affordable
- No special power and cooling requirements

History - [ASCI-RED](#) to NUC Desktop in 20 years

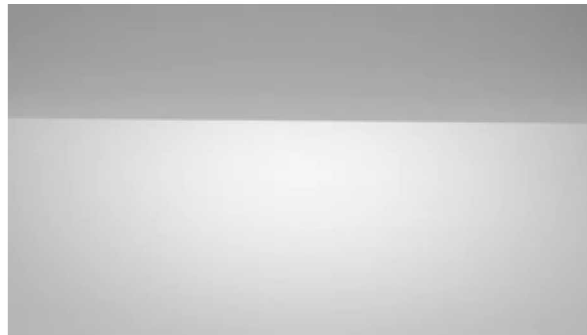

ASCI-RED

- \$46 Million
- 1.037 TFLOPS
- 1600 SqFT
- 850,000 Watts
- 1816 Compute Blades

NUC Desktop

- \$5100
- 1.2 TFLOPS
- .026 SqFT
- ~75 Watts
- 6 Compute Blades

Successful Prototype

- Multiple CTH runtimes have completed using input decks straight from Capacity Clusters
- Demonstrated ability to easily boot additional desktop hardware to increase performance
- Primary head node capable of booting production HPC hardware in standalone capability
- Functions in standalone – No external network
- Programming environment identical to current Sandia standards

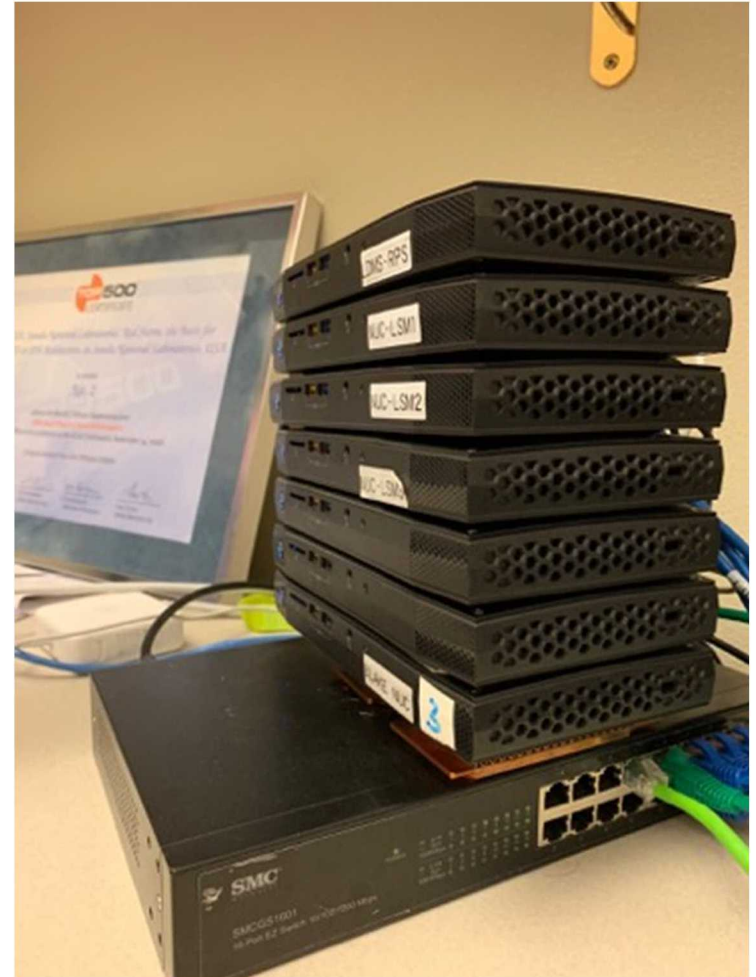

Current Prototype - Fully functional prototype to demonstrate desktop HPC using SNL production codes

INTEL NUC – HARDWARE

- NUC-RPS – Head node serving TFTP,DHCP,NFS, OS Images
- NUC-LSM[1-6] - Diskless compute (8 Logical Cores, 32GB RAM)
 - 48 Logical Cores
 - 468 Watts
 - ~1.2 TFLOPS. New Hardware has better performance
- Completely Standalone – No network connectivity required
 - Pre and Post processing capability
 - Simply attach monitor and keyboard to head node
- 1 GB or 10 GB(USB-C) Ethernet
- Serviceable Parts (FRU)

SOFTWARE

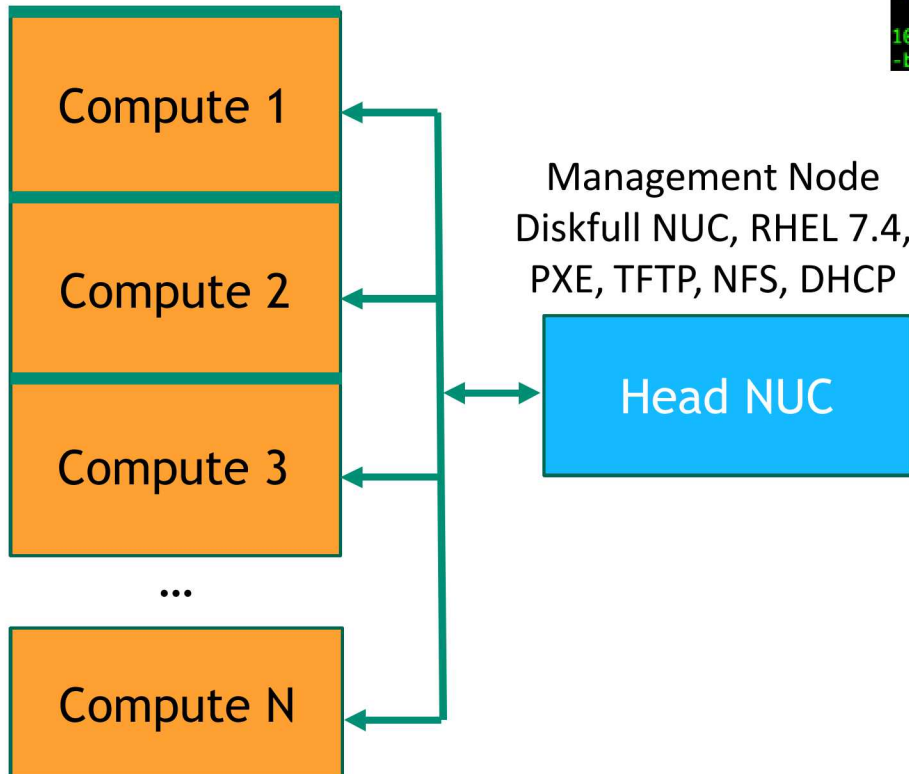

- RHEL 7.4
 - Munge, dhcp, nfs, iptables, rsync, gcc, etc
- SLURM
 - SLURM 18
 - PAM
- X86_64 Programming Environment
 - GCC, Intel, papi, vtune, make, openmpi, etc

Hardware

Compute Nodes

Diskless, RHEL 7.4, PXE BOOT

Software

SLURM – Queue/Allocate Personal

```
-bash-4.2$ sinfo
PARTITION AVAIL  TIMELIMIT  NODES  STATE MODELIST
ldms-alpha up 2-00:00:00    22  down* ovis-demo-[01-22]
ldms-beta  up 2-00:00:00     6  alloc nuc-lsm[1-6]
-bash-4.2$ squeue
JOBID PARTITION     NAME     USER  ST        TIME  NODES MODELIST(REASON)
1000005 ldms-beta  vgkuhns_ jpkorbi  R 1-00:49:13      6 nuc-lsm[1-6]
-bash-4.2$
```

OCT1 – CTH Runtime Output

```

CCCC      YTTTTT      R      H      H
C          T          T      H      H

How it works - Scalable from Desktop to Production HPC

Boot either NUC Nodes or Production HPC cabinet nodes

- System has demonstrated scalability from desktop miniPC to 1536 cores on standalone HPC cluster
- All data isolated to management node
- Can seamlessly transfer to larger HPC environment
- Compatible with production submission scripts
- Compartmentalized (Separate management nodes)

Intel Skylake x86-64,
AVX512 CPU Architecture

Boot NUC Cluster and take HPC with you

- Functional in multiple environments
 - Workstation
 - Remote Facilities (Ie: Thunder Range)
 - Vehicle
 - Airborne
- Allows for HPC at data collection point
 - No need for special cooling or power facilities

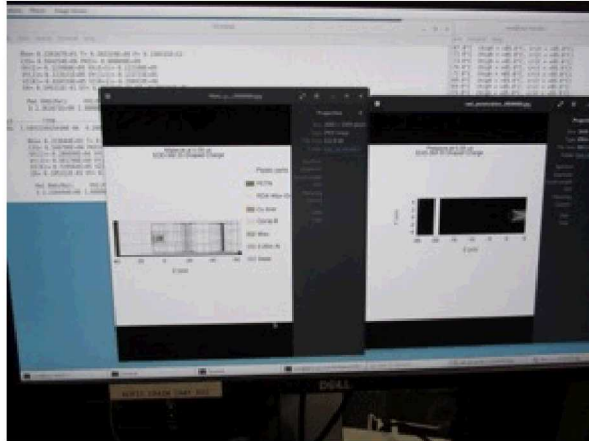

Typical HPC Model

- HPC Cabinet connects and processes data via corporate network
- 010101 – Left Side in beginning

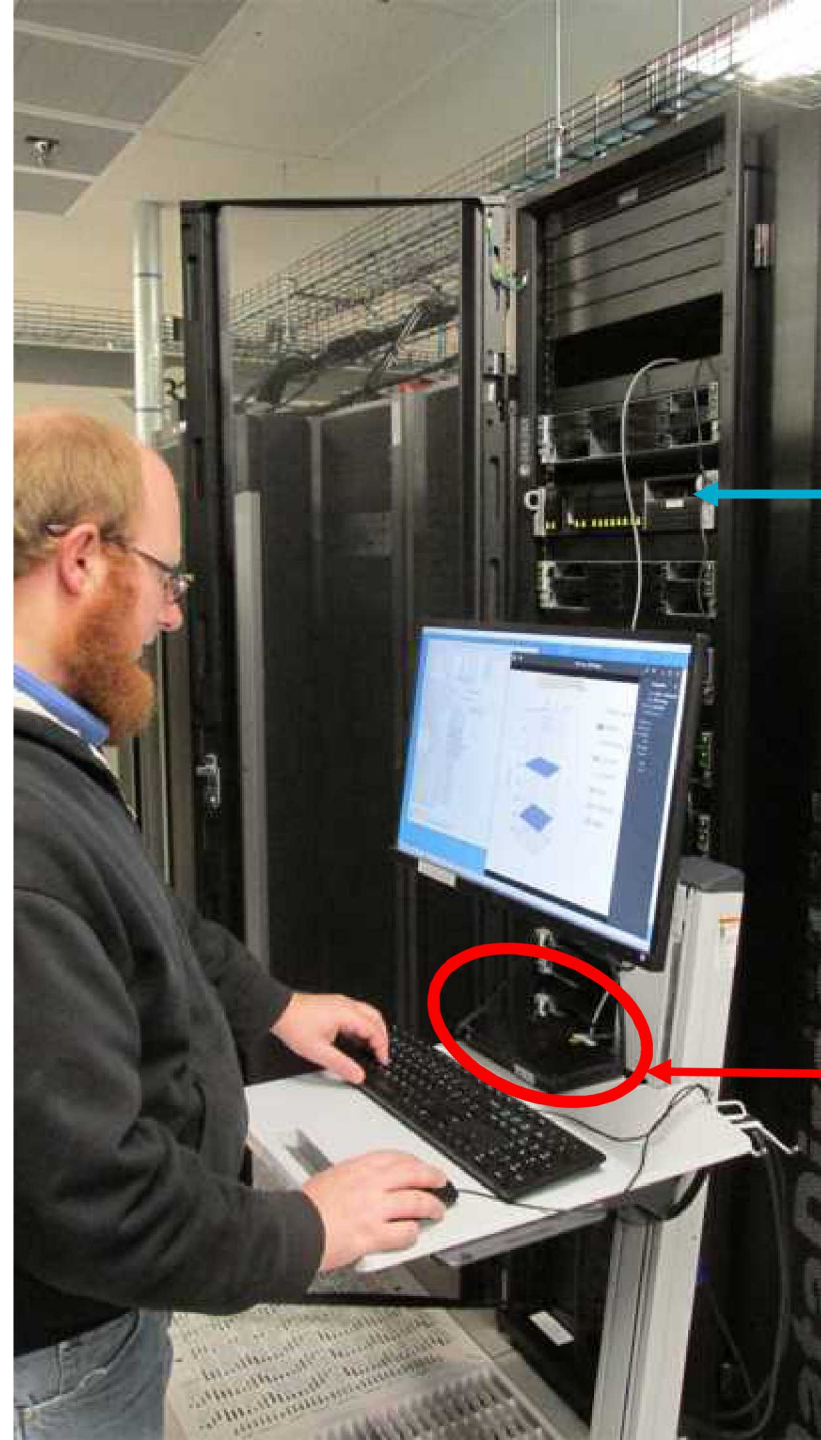

Our Model

- Remove corporate network
- Boot HPC Cabinet in standalone using NUC Head Node
- Secure NUC in safe once work is complete
- Power cycle rack, prepare for next compartment, next NUC.

John Korbin (1555) booting HPC resource from NUC, analyzing runtime data on NUC Console.

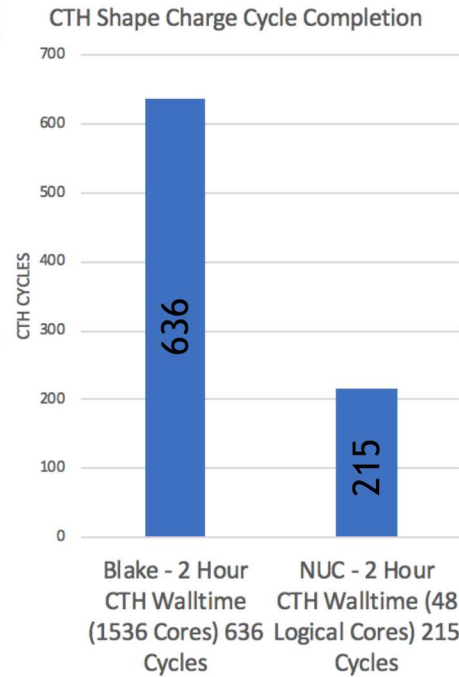

CTH - Shape Charge

STANDALONE HPC CABINET

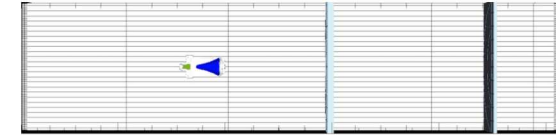

NUC

HPC Cabinet – CTH Performance comparison

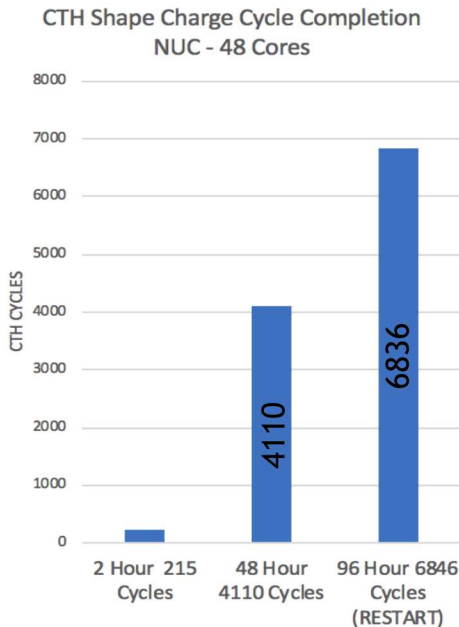

Blake – 1536 Skylake HPC Cabinet

- $2\mu s$ simulation output (jpg)

NUC – 2 Hour

- $0\mu s$ simulation output (jpg)

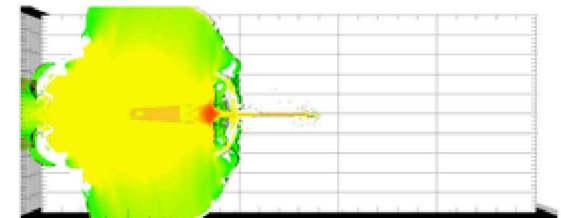

NUC – 48 Hour

- $11\mu s$ simulation output (jpg)

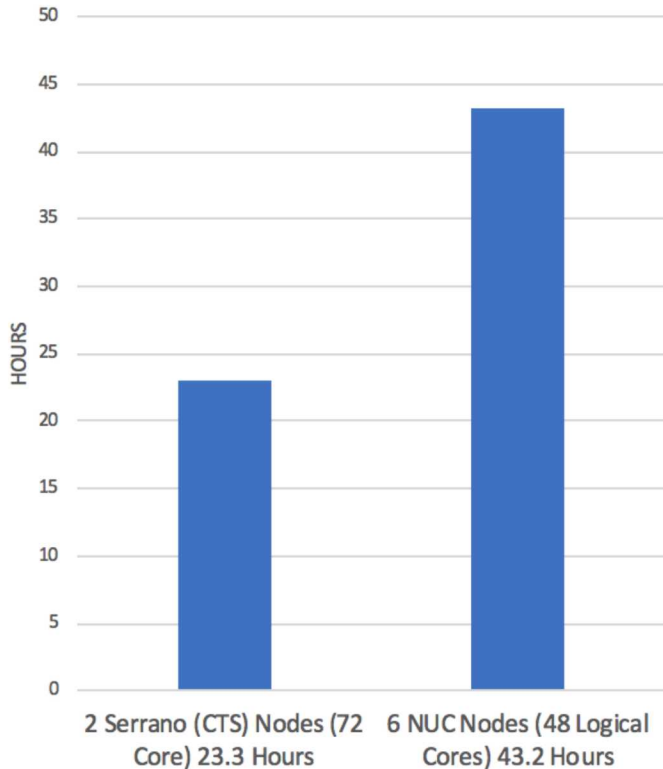

NUC – 96 Hour (Restart)

- $24\mu s$ simulation output (jpg)

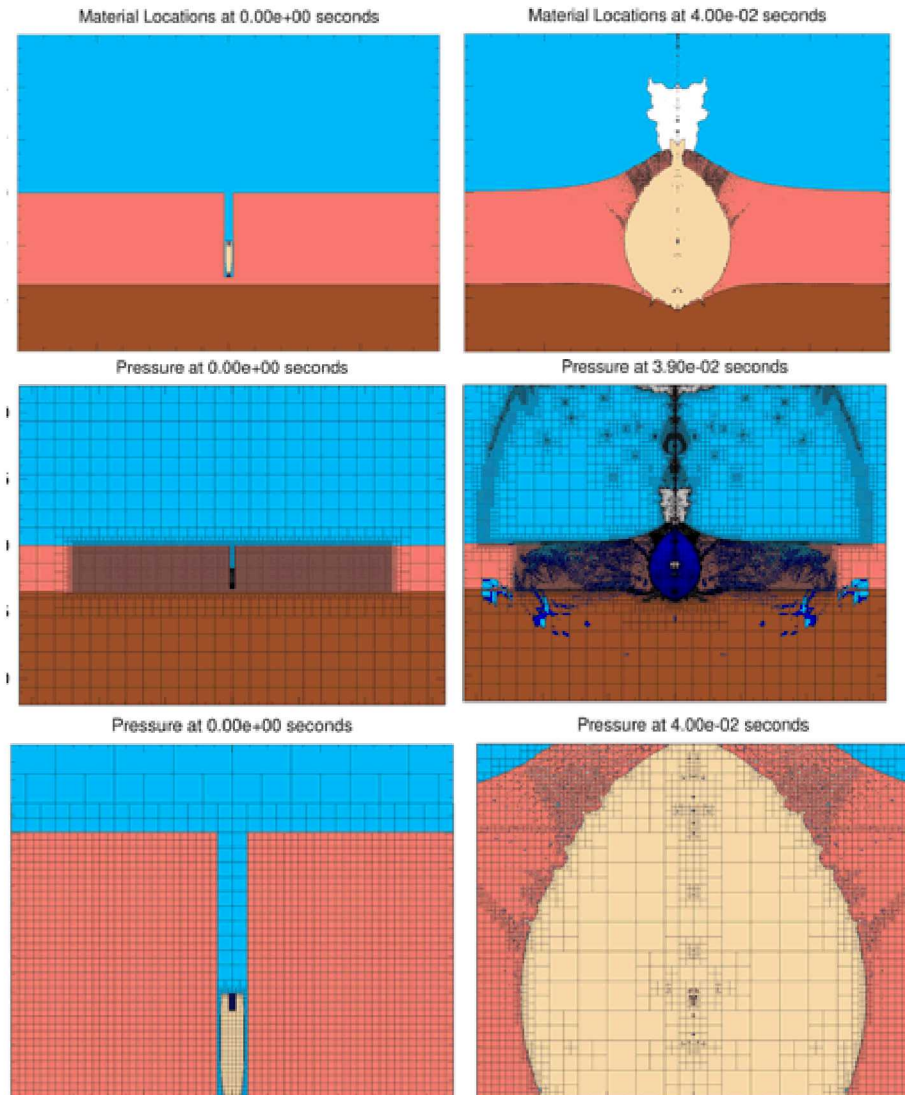

HPC Cabinet – 2 Node Serrano (CTS) Compute vs NUC pHPC

Mark 82 in Granite (TO JOB COMPLETION)

Serrano

- 1.2 TFLOPs/Node
- 2.1 GHz Intel Broadwell
- ~380 Watts/Node

Fully Operational HPC Desktop environment

- Mirrors functionality of production clusters
- Batch queue submission capability
- Compiler Environment

CTH 12.1 Built

- Currently compiled and shown to be operational on the desktop
 - Various OUO problems have been tested
- Capable of cold booting HPC cabinet for high fidelity runs
 - Tested on 1536 cores, 32 Nodes (Intel Skylake / Omnipath)

Desktop Workload

- Capable of running unmodified input decks used on production clusters

Current Capabilities

- Under \$10k
- Wall Power (Minimal Facilities)
- Proven standalone system that never touches internet or exposes existence of a project
- Ability for single individual to control all data from start to finish

Path forward

- Review architectures in testbed environment
- Review security requirements in non networked environments
- Continued testing of Sandia Mission Codes
- Engage with manufacturer to drive hardware development

Staffing

TBD
