

Connecting Theory and Experiment in “Inside the Box” Studies of Hydrocarbon Oxidation Chemistry

Craig A. Taatjes

***Combustion Research Facility
Sandia National Laboratories
Livermore, CA 94551***

Hydrocarbon Oxidation Powers Our Society and Is a Key Process in Earth's Atmosphere

Combustion produces ~ 85% of the United States' energy

Hydrocarbon combustion provides nearly all of the energy for transportation

Clean, efficient combustion is part of global energy strategies

Global Oxidation Chemistry

Time and length scales are much different than in combustion

Transport changes chemistry

Comprehensive Kinetic Mechanism

Ozonolysis reactions

Atmos. Chem. Phys., 3, 161-180, 2003

Detailed oxidation mechanism of a single compound is a complicated network of reactions

Jenkin et al., Atmospheric Environment 34 (2000) 2837-2850

Tropospheric and Engine Oxidation Processes Both Run on Radical Chain Chemistry

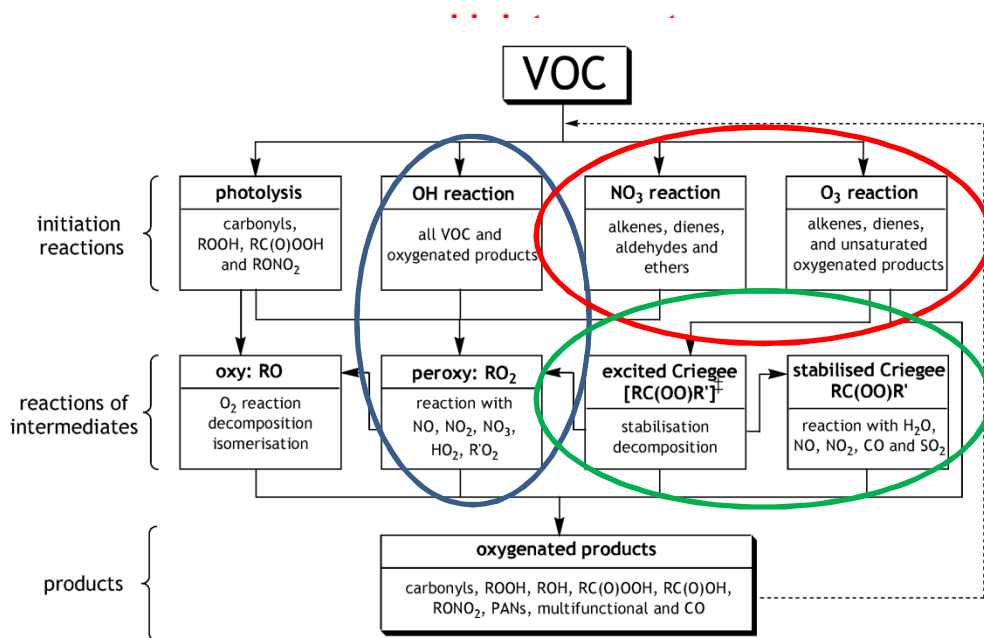

Ignition Chemistry:

- Chain-branching pathways are a “nonlinear feedback” for autoignition
- Alkyl + O₂ reactions and “QOOH” intermediates are central to low-temperature chain branching

Tropospheric Chemistry:

- Alkyl + O₂ reactions from OH-initiated oxidation also important in troposphere
- NO₃ and O₃ species are also important oxidation initiators
- Criegee biradical intermediates are important species for OH, aerosol formation, NO_x, SO_x

General Alkyl Radical Oxidation Scheme

QOOH₂

Atmos. Chem. Phys., 3, 161–180, 2003

low temperature

Adapted from Walker and Morley, "Basic Chemistry of Combustion," in *Low Temperature Combustion and Autoignition*, Ed. M. J. Pilling, (Comprehensive Chemical Kinetics Vol. 35) Elsevier, 1997

Predicting Oxidation Chemistry Requires Knowing Reactions of “Intermediates”

Ozonolysis is a major component in tropospheric removal of hydrocarbons – makes Criegee biradicals

Criegee intermediates also appear in $\text{QOOH} + \text{O}_2$ reactions Andersen and Carter, *J Phys. Chem. A* 107, 9463-9478 (2003); Asatryan and Bozzelli, *J Phys. Chem. A* 114, 7693-7708 (2010)

Criegee intermediates are *isomers* of more stable products, organic acids or esters

No one has directly measured a Criegee reaction

Criegee Intermediate

Formic Acid

Predicting Oxidation Chemistry Requires Knowing Reactions of “Intermediates”

QOOH + O₂ is responsible for chain branching

QOOH radicals are *isomers* of the major reaction products ROO

No one has ever seen a QOOH by any means

You Don't Need to Know Much Chemistry to Make an Engine!

Nikolaus August Otto (1832-1891)

Rudolf Christian Karl Diesel (1858 –1913)

Nikolai Nikolaevic Semenov (Chemistry Nobel, 1956)

“Some problems relating to chain reactions and to the theory of combustion”

Advanced Engines Rely on Autoignition Chemistry to an Unprecedented Degree

Gasoline Engine

(Spark Ignition)

Hot-Flame Region:
NO_x

Diesel Engine

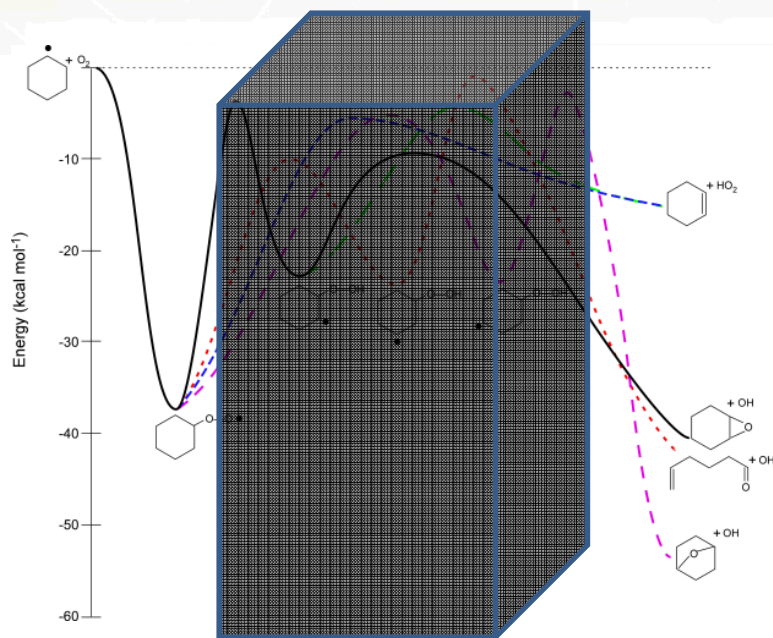

(Compression Ignition)

Hot-Flame Region:
NO_x & Soot

Manley et al., Physics Today, November 2008, 47–52

How Can We Tell Anything about the Reactions of These Intermediates? Deal with the Black Box!

Measure products of R + O₂ reactions and compare to theory

Rigorous theoretical kinetics (Stephen Klippenstein, Jim Miller, Judit Zádor)

Change conditions and see what happens to time behavior and product yields

Measure products of ozonolysis and compare to theory and models

Add scavengers that are thought to remove Criegee intermediates, see what happens to stable product yields

Basis of our strategy: Comparison of experiment and detailed calculations can reveal mechanisms

Experiment: Measure OH and HO₂ formation in pulsed-photolytic Cl-initiated oxidation of alkanes

Infrared frequency-modulation spectroscopic detection of HO₂
Ultraviolet absorption detection of OH radicals

Basis of our strategy: Comparison of experiment and detailed calculations can reveal mechanisms

Compare to time-dependent multiple-well master equation solutions

Ab initio characterization of stationary points on the potential surface (Stephen Klippenstein, Jim Miller, Judit Zádor)

Parameterization of ME solution (SJK / JAM/ JZ) input to kinetic models

Includes formally direct pathways for isomer and product formation

Adjust stationary point *energies* to reproduce body of experimental evidence

We have reinvestigated OH production in ethyl + O₂ and propyl + O₂ reactions

Ethyl and propyl radical reactions with O₂ are prototypical

Although the PES's are similar, ethyl + O₂ reaction has barriers for OH formation above reactants while for the propyl + O₂ reactions barriers are below reactants

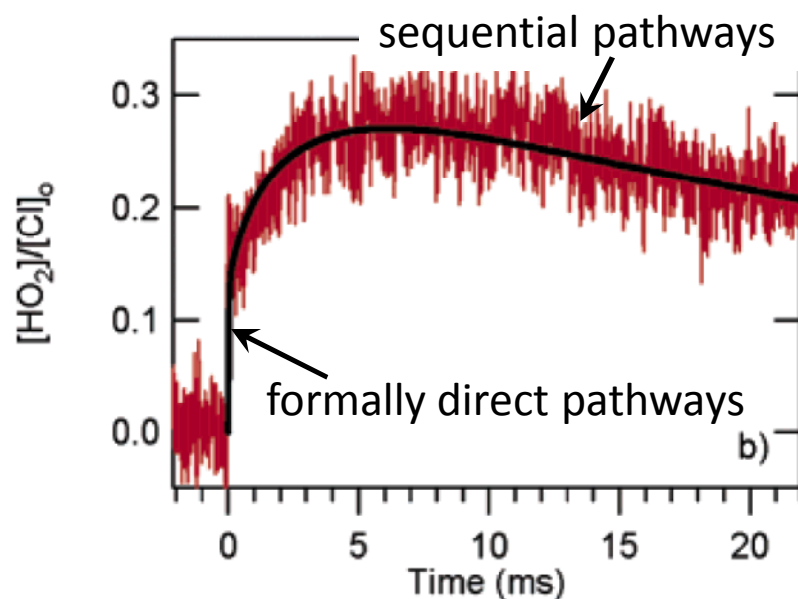

DeSain, J. D.; Taatjes, C. A.; Miller, J. A.; Klippenstein, S. J.; Hahn, D. K. *Faraday Discuss.* **2001**, 119, 101.

DeSain, J. D.; Klippenstein, S. J.; Miller, J. A.; Taatjes, C. A. *J. Phys. Chem. A* **2003**, 107, 4415.

Huang, H.; Merthe, D.; Zádor, J.; Jusinski, L. E.; Taatjes, C. A. *Proc. Combust. Inst.* **2010**, 33, 293.

In previous work, HO_2 profiles were modeled perfectly, but OH profiles could not be reconciled

Model using best $\text{R} + \text{O}_2$ rate coefficients from rigorous ME treatment

Estupiñán, E. G.; Klippenstein, S. J.; Taatjes, C. A. *J. Phys. Chem. B* **2005**, *109*, 8374.

DeSain, J. D.; Klippenstein, S. J.; Miller, J. A.; Taatjes, C. A. *J. Phys. Chem. A* **2003**, *107*, 4415.

Validation of the Master Equation calculations for the OH channels requires more accurate experimental results.

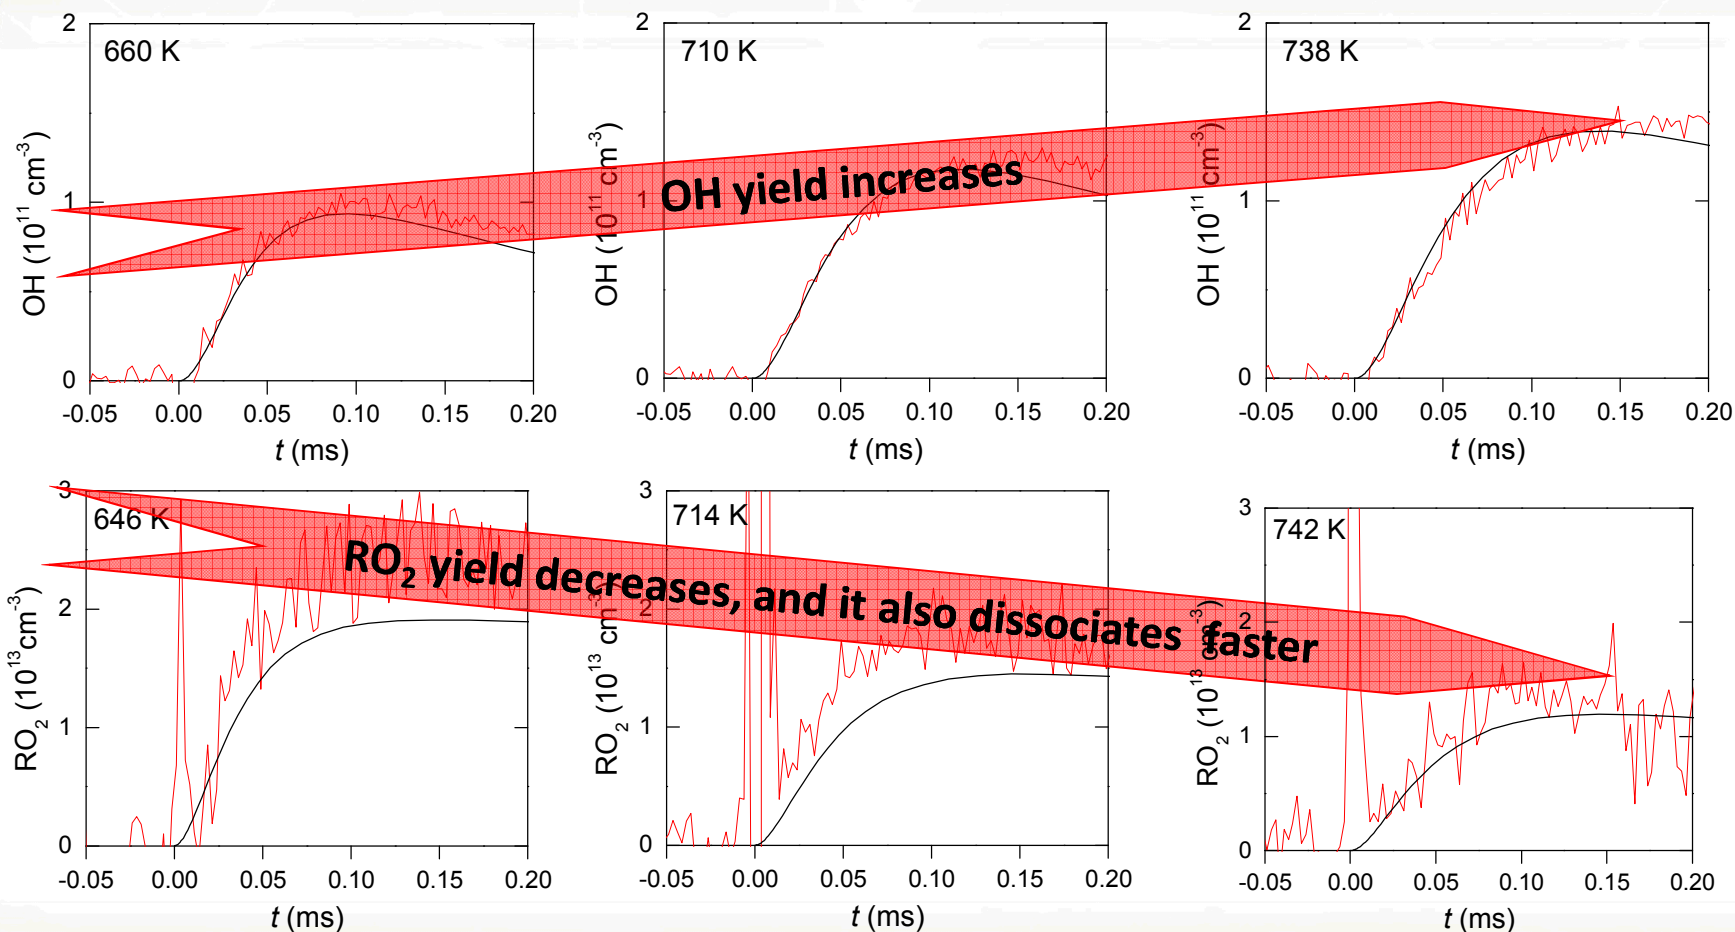

New OH experiments improved upon the previous measurements in two very important aspects.

- Cl_2 or $(\text{COCl})_2$ radical source
 - → Few unwanted side-reactions (chain-chlorination is negligible).
- Detection by **differential direct long-path absorption at 308 nm** (frequency doubled 616 nm CW ring dye laser)
 - Yields OH concentrations directly.
 - Detection limit is $\sim 10^{10} \text{ cm}^{-3}$ (total density is $\sim 10^{17} \text{ cm}^{-3}$).
 - Absorption spectroscopy also allows the measurement of other species.

Haifeng Huang

RO₂ and OH production in Cl-initiated ethane oxidation has been remeasured from 660-740 K

Measured and calculated OH concentrations agree very well up to 200 μs .
 Note that all curves are **unscaled absolute concentrations**!

Experimental kinetics determinations depend on more than the single reaction of interest

OH is formed principally via “formally direct” pathways.

➔ These experiments probe (and confirm) $\text{RO}_2 \leftrightarrow \text{QOOH}$ barrier height

A significant contribution comes from ethyl + HO₂. The rate coefficient is based on methyl + HO₂ (Jasper et al. 2009 PCI).

Also, HO₂ + Cl produces some OH, but it is a relatively well-characterized reaction.

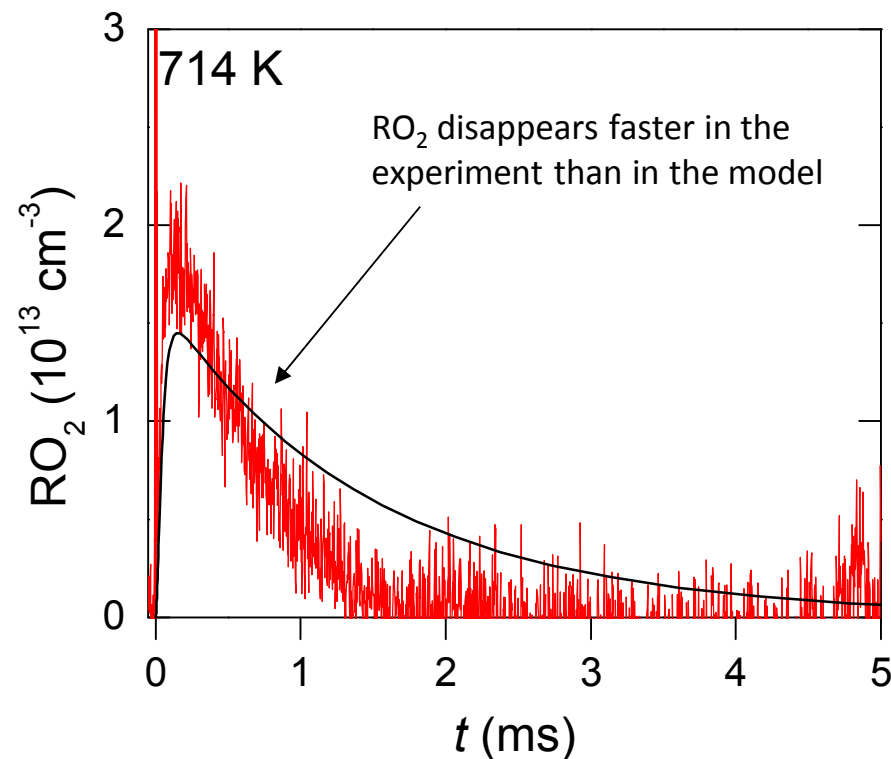

After 200 μs ethane + OH is expected to dominate OH profile with a small contribution from $\text{C}_2\text{H}_5 + \text{O}_2 \rightarrow \text{OH}$ induced by RO_2 backdissociation.

Concentration profiles on the longer time-scales reveal important secondary reactions.

Ethyl + O₂ contribution takes place in first ~200 μs based on our model.

RO₂ concentration is forced to match the measured profile

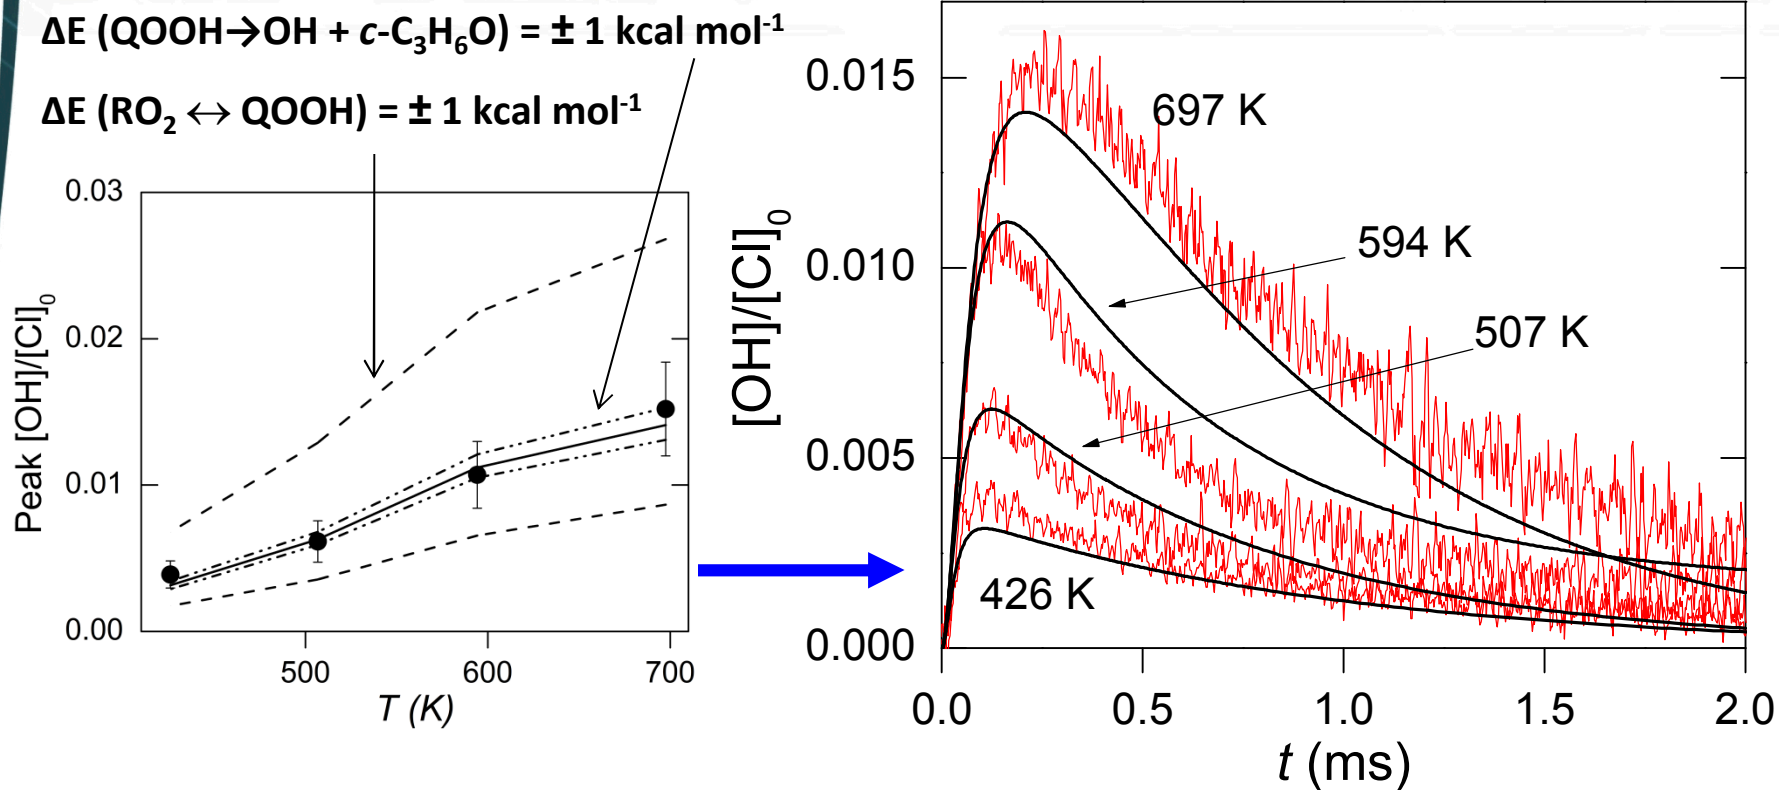

At 660 K only ~15% branching is needed to reproduce data.

Judit Zádor

Constraining RO₂ to its measured values and adding $\text{RO}_2 + \text{HO}_2 \rightarrow \text{OH}$ eliminates almost all discrepancies on the whole 5 ms timescale.

OH production in Cl-initiated propane oxidation (426-697 K) is also well-modeled

The propyl + O₂ reaction produces more OH, therefore, secondary chemistry is relatively less important than for ethane, even at longer times.

The OH formation is very sensitive to the ROO \leftrightarrow QOOH transition state

Experiments validate stationary points on the ethyl + O₂ and propyl + O₂ potential energy surfaces

Previous HO₂ measurements at Sandia

Current OH measurements

High-pressure experiments are underway

Lenny Sheps

High-pressure experiments will help refine the potential energy surface.

Models for all conditions must use the same stationary points

Propane oxidation – what will high-pressure experiments tell us?

Increased stabilization is predicted to drastically reduce OH from $R + O_2$

Is OH mostly from $QOOH + O_2$ at high pressure?

Can these experiments get at QOOH?

Cyclohexane oxidation – high-pressure experiments

Shape predicted from master equations
Amplitude all wrong, but $R + O_2$ already validated at low pressure

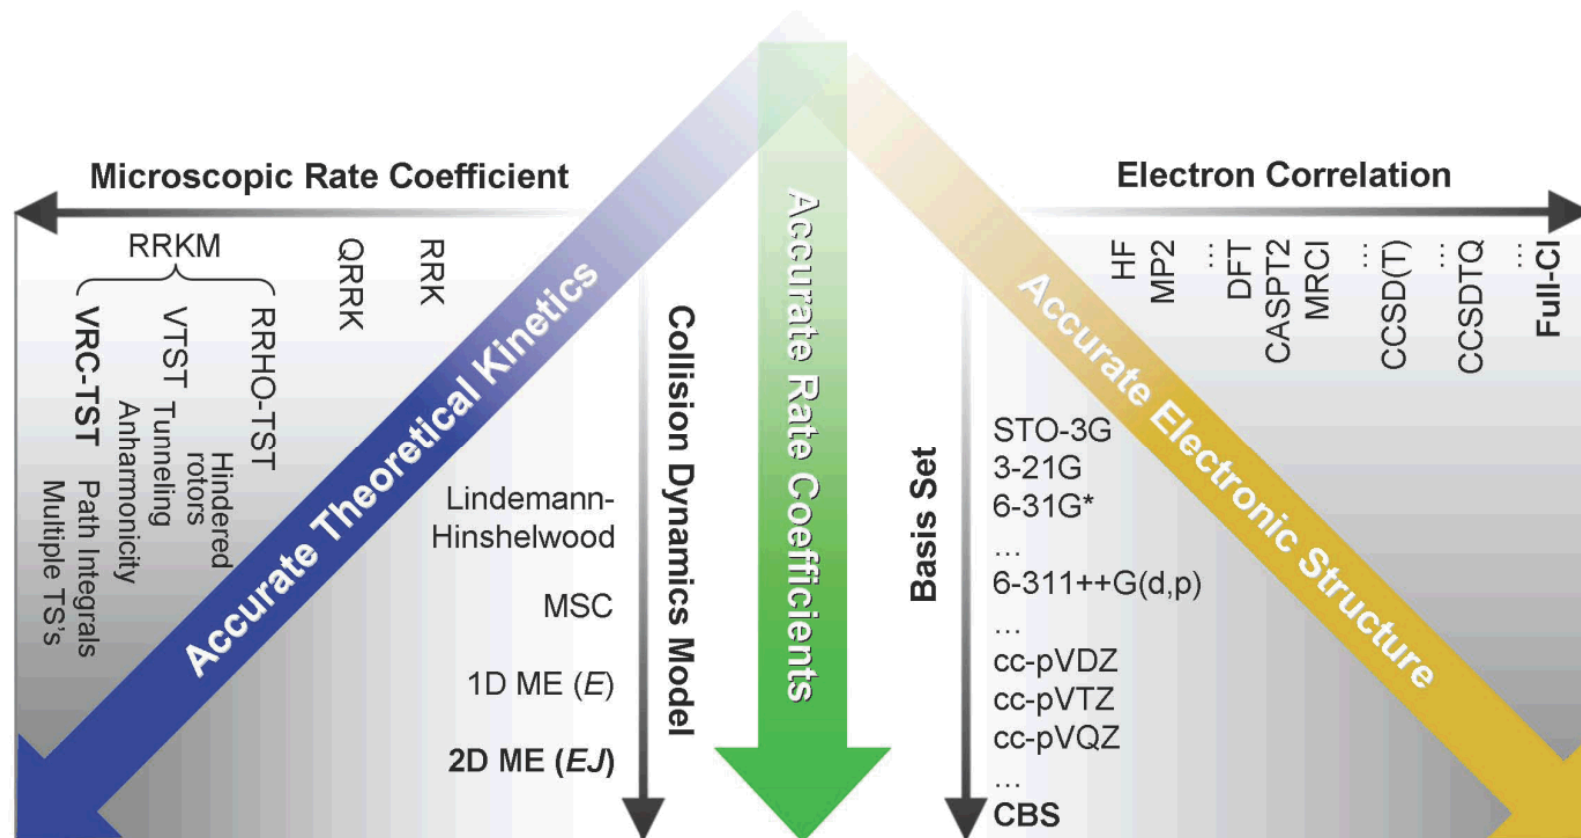

Attribute difference to $QOOH + O_2$ reactions

Role of $O_2 + QOOH$ in Low-Temperature Ignition of Propane.
1. Temperature and Pressure Dependent Rate Coefficients

C. Franklin Goldsmith, William H. Green, and Stephen J. Klippenstein, J. Phys. Chem A, doi:10.1021/jp210722w

Experimental kinetics *indirectly* relates to physical characteristics of the potential energy surface

Experimental constraints on the stationary point characteristics rely on the accuracy of the theoretical kinetics method

More accurate quantum chemistry may highlight inadequacies in the kinetics!

Can't we do better? – Maybe detecting two products (OH and HO₂) isn't enough?

Tunable synchrotron photoionization mass spectrometry

Collaboration between Sandia CRF (**David Osborn**, C.A.T.) and LBNL (Musa Ahmed, Kevin Wilson, Steve Leone)

Osborn et al., *Rev. Sci. Instrum.* **79**, 104103 (2008)

Laser photolysis reactor is coupled to time-of-flight mass spectrometer with synchrotron photoionization

Multiplexed photoionization mass spectrometry (MPIMS)

Universal detection (mass spectrometry)

High sensitivity (synchrotron radiation + single ion counting)

Simultaneous detection (*multiplexed* mass spectrometry)

Isomer-resolved detection (tunable VUV, ALS synchrotron)

Kinetic data is acquired as a function of kinetic time, mass, and photoionization energy

Taatjes et al., Phys. Chem. Chem. Phys. 10, 20 (2008).

3-D dataset can be “sliced” along different axes to probe different aspects of the reaction

Cl-initiated isobutane oxidation

Time behavior of product formation
– prompt and delayed

Photoionization spectra identify
product isomers

How do these experiments constrain theory?

Methylpropanal is a prominent initial product in the oxidation

Where does it come from?

Direct formation? CBS-QB3 – “has a high barrier and is unimportant” Miyoshi, *J. Phys. Chem A* 115, 3301–3325 (2011)

Walker proposed formation from QOOH:

If methylpropanal is formed from the β -hydroperoxy QOOH radical, deuteration at the tertiary site should not change the isotopolog of the product

Measure products of $(\text{CH}_3)_3\text{CD}$ oxidation --
Find singly deuterated methylpropanal

Why?

Does methylpropanal form from the other QOOH? – could make a difference in models of autoignition

Or is direct formation by 1,3 isomerization easier than we thought?

That's all still pretty indirect – Isn't there *some* way we can do better?

What are these “intermediates” again?

QOOH is an isomer of the more stable ROO intermediate

Criegee intermediates are isomers of more stable tropospheric species

But we have a machine that can resolve isomeric chemistry!

Why are these things so hard to detect?

The hole in the bottom of the bucket is bigger than the hole at the top!

People get out of the rain!

They don't stay in their reactive configuration very long – they are made slowly and consumed rapidly

We need sensitive and selective detection and a way to make intermediates directly

In fact, tunable synchrotron photoionization *can* identify novel isomeric intermediates

Ozonolysis of alkenes proceeds via a carbonyl oxide intermediate ("Criegee intermediate")

They are important tropospheric reactants but only indirect measurements exist

Problem is to make enough

Dimethyl Sulfoxide (DMSO) oxidation may form CH_2OO (Asatryan and Bozzelli, PCCP 10, 1769 (2008))

Time-of-flight can resolve CH_2S from CH_2OO

Photoionization Efficiency

Relative Ion Signal

No one ^{had} ever seen a gas phase Criegee intermediate

Taatjes et al., J. Am. Chem. Soc. 130, 11883 (2008)

Can photoionization directly detect and characterize the elusive QOOH?

QOOH reactions are critical for autoignition but only indirect measurements exist

Most ROO have no stable parent cation
(Meloni et al., *J. Am. Chem. Soc.* 128, 13559 (2006)),
but some QOOH⁺ are stable

Problem is to make enough!

Cl + alkylhydroperoxide reactions make QOOH: e.g.,

Reaction with O₂ competes with dissociation – forms other products

Detection of Reaction Products Can Give Direct Kinetics Measurements

$$k(\text{QOOH} + \text{O}_2)/k(\text{dissociation}) = (2.5 \pm 0.4) \times 10^{-17} \text{ cm}^3$$

Correctly scaled change in dimethyloxirane is linear in $[\text{O}_2]$

Direct measurement of QOOH + O_2 rate coefficient relative to thermal dissociation

Problem is we don't know the absolute k of either process!

Fix this by doing experiments with better time resolution

However, no QOOH⁺ (yet!)

Measurement of OH Formation from QOOH Probes the Dissociation Rate Coefficient

- Photoionization experiments show that QOOH is formed
- OH profiles can be modeled and compared to theory

- Dissociation of QOOH shows falloff that is in reasonable agreement with (adjusted!) theory (barrier height reduced by $0.4 \text{ kcal mol}^{-1}$ from CBS-QB3)

Modeling the Dependence on O₂ Concentration Now Provides Absolute Rate Coefficient

- Rate coefficient is similar to the calculated rate constant for similar hydroperoxypropyl radical reaction with O₂ (Goldsmith, Green, and Klippenstein)

- Stabilization is main channel at room temperature
- No discernible pressure dependence
- More work – other products? Temperature dependence?

Detection Is One Thing, Kinetics Is Another: Make More Criegee to Measure Reactions

- Arkke Eskola et al. (2006) found that CH₂OO atom – turns out to be intermediate!
- Can make lots of Criegee reactions with imp

Reaction of CH₂OO with NO₂ is **50 times** what is used in models
 If other Criegee intermediates react similarly, Criegee reactions are significant NO₃ source

Reaction of CH₂OO with SO₂ is up to **10 000 times** models
 If other Criegee intermediates react similarly, Criegee reactions are major SO₂ oxidant

Welz, Savee, et al., *Science* **335**, 204 (2012)

What does all this mean?

- **Sulfate chemistry makes aerosols**
 - Aerosols tend to reflect radiation
 - Criegee chemistry connected to “cooling”
 - Biggest Criegee contribution where there is a lot of ozone and alkenes

Photo: Christian von Wissel

- **We are *just beginning* to understand how Criegee biradicals react**
 - Need to understand larger Criegee molecules
 - Need to understand more reactions: e.g., reactions with carbonyls make secondary ozonides
 - Need to understand reactions at different conditions

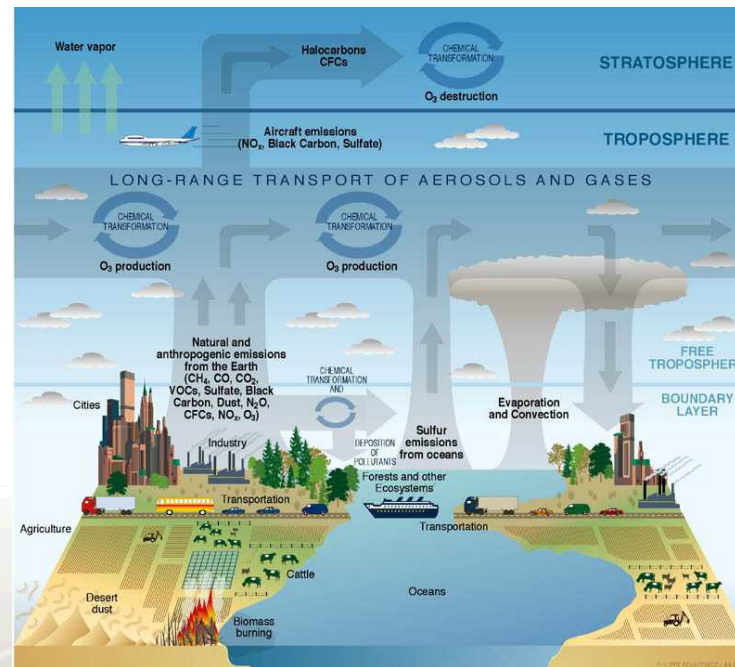

What is the philosophy of our research?

Robert Couse-Baker
