

# LayTracks3D: Hex & Hex-dominant Meshing Via MAT

William Roshan Quadros  
Sandia National Labs

Aug 09, 2013

# Layout of Presentation

- Goal
- LayTracks
- LayTracks3D Overview
- Rails in 3D
- Tracks in 3D
- All-Hex
- Results
- LayTracks3D for Assembly Model
- Future Work
  - All-Hex
  - Size & Anisotropy Control
  - Geometry Adaptive
  - Non-Linear Tracks
  - Mesh Morphing
  - Parallel Meshing

# Goal

- **Handles General Solids:**
- **Boundary Sensitive:** Elements at the boundary are near cube shape. This is essential requirement for many boundary conditions.
- **All-Hex :** MAT is a mathematically well studied symmetric skeleton and may provide theoretical proof for guaranteed all-hex. Special treatment is needed where mapping between boundary and medial is not one-2-one (e.g. one-2-many map at concave regions and many-2-one map at finite contacts).
- **Orientation Insensitive:** Gives same output for all orientations of input model.
- **Respects B-Rep:** Mesh aligns with boundary curves and surfaces. Thus captures sharp boundary features.
- **Respects External Mesh Sizing/Intervals:** The mesh size/interval specified by the user on boundary entities (vertex/curve/surface) is mapped to corresponding medial entities before meshing the medial surface.
- **Handles Assembly Models:** Map between the boundary and the medial enables resolving all the boundary imprints on medial. Tracks cut interface of assembly orthogonally and gives automatic conformal mesh.
- **Geometry Adaptive Meshing:** Radius function of MAT can be used to control element size, anisotropy, and orientation.
- **Fast Remeshing:** Once the MAT is calculated for a given input solid, obtaining multiple meshes with varying mesh size 'h' for V&V is significantly fast without any collision checks.
- **Mesh Morphing:** Old meshes can be morphed easily to new deformed geometry if MA topology does not change.
- **Parallel Friendly:** Decomposition-based method is parallel friendly. Node placement on all rails and laying hex elements inside all tracks can be parallelized.

# LayTracks3D:

Extension of LayTracks, 9<sup>th</sup> IMR, Oct 2000

LayTracks decomposes general complex domain into simpler non-intersecting tracks

Tracks propagate orthogonally at the interface of multiple surfaces

Demo

# Rails in 3D

# Rails in 3D: Radius

- 90 degrees at Boundary
- Symmetric
- Shortest Distance from MA to Boundary

# Rails in 3D: Bi-partite Graph

# Narrow Corridor Removal

Figure 6. Four cases of narrow corridor.

# Narrow Corridor Removal

Figure 7. Removal of narrow corridor.

# Rails in 3D: Connects Elements of Sets

- Forward Map:  $y = f(x)$

- Reverse Map:  $x = f^{-1}(y)$

# Rails in 3D: Control Polygon

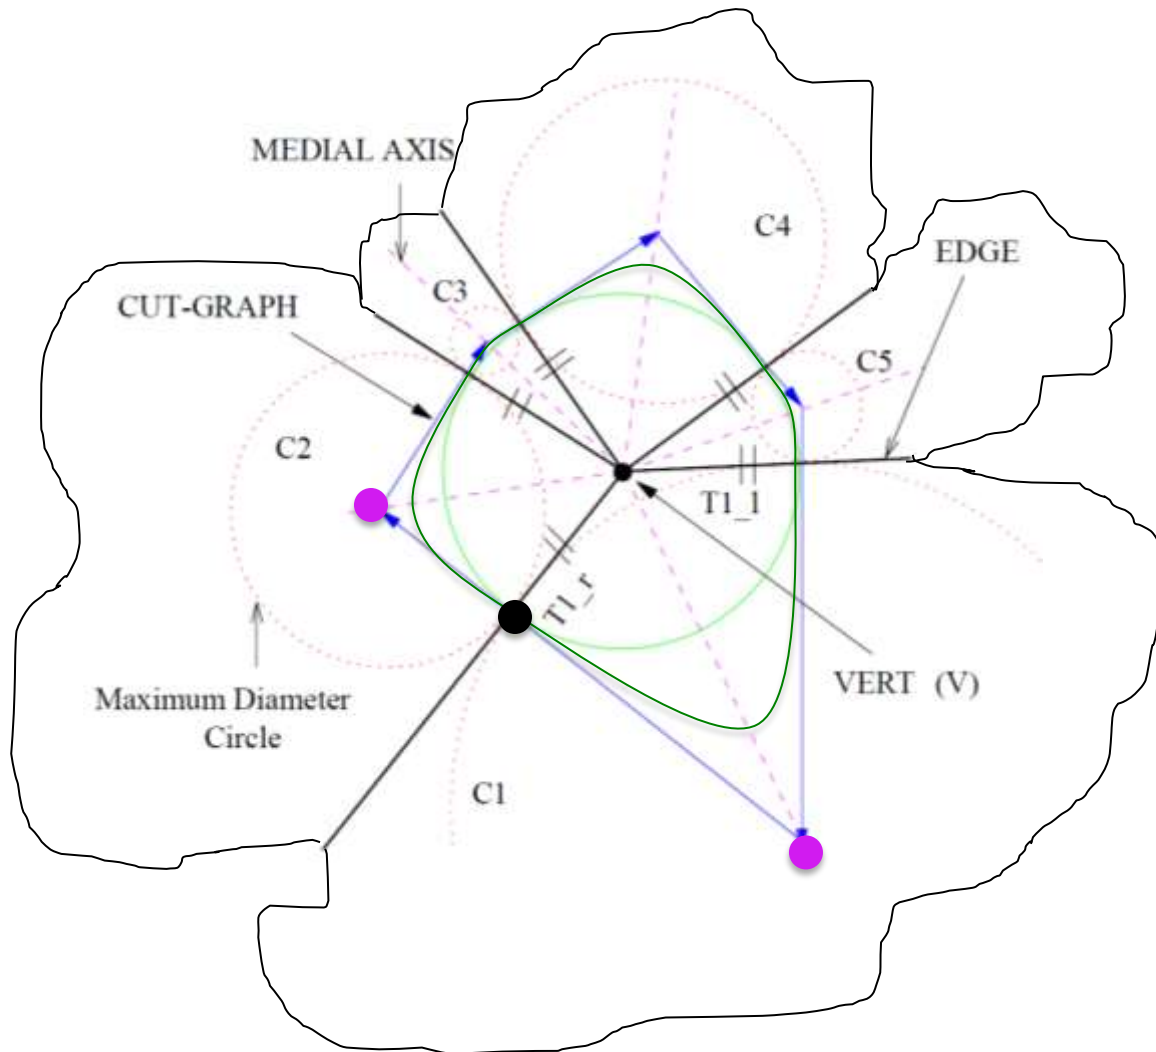

Figure 6.1: Rails Represented by Straight Lines and NURBS

# Rail as Control Polygon: Non-intersecting & Orthogonal

# Tracks in 3D

- Region Bounded by Path of Adjacent Rails.
- No Branch: One entry and One exit
- Enters and Exits Boundary Orthogonally
- Symmetric Inside Each Solid
- Shortest Path
- Track width can vary with Medial Radius
- Tracks can be non-linear

# All-Hex?

1. LayTracks3D decomposes a general 3D domain into a set of connected 3D Tracks\*.
2. LayTracks3D guarantees even number of quads on the boundary of each 3D Track and guarantees all-hex in each 3D Track.

\*N-to-1 and 1-to-N regions need to transformed into 1-to-1 map

# 2-Way Map at Regions of Interest

- 1-to-1
  - Convex Edge
  - Convex Vertex
  - Convex Edge with Large Angle
- N-to-1
  - Concave Vertex
  - Concave Edge
- 1-to-N
  - Finite Contact at Cylinder
  - Finite Contact at Sphere

# Solution for Concave Edge/Vertex: Transform 1-to-N to 1-to-1

Spread duplicate nodes at concave vertex/edge  
by perturbing the 2-way map

# Solution for Finite Contacts - Transform N-to-1 to 1-to-1

$(N\text{-to-}1) \rightarrow (1\text{-to-}N) \rightarrow (1\text{-to-}1)$

# Solution at Large Angle Convex Edge: Collapse Medial Face

# Optimizing Interval and Merging Tracks at Medial

LayTracks3D for Assembly

# Assembly Model

# LayTracks3D for Assembly Model

- LayTracks3D resolves all the boundary imprints and medial junctions.
- Tracks cut through the interface and gives automatic conformal orthogonal mesh.

# Assembly Model

# Imprints on Top, Bottom, and Sides

# Imprints on Top, Bottom, and Sides

# Automatic Geometry Decomposition via Imprints and Medial Junctions

CORRIDORS

# Quad Mesh on Imprinted Medial

# Tracks in 3D

# Hex Mesh

# Future Work

- LayTracks3D
  - All-Hex
  - Size & Anisotropy Control
  - Geometry Adaptive
    - Track width based on radius function
  - Non-Linear Tracks
    - Rails as Control Polygon in 3D with repeated knots
  - Mesh Morphing
  - Parallel Meshing

# Geometry Adaptive Meshes via Radius Function

Figure 5.1: Paving for adaptive mesh.

# Geometry-Adaptive Tracks

# Non-linear Tracks: Rails as Control Polygons

Figure 6.1: Rails Represented by Straight Lines and NURBS

# Non-Linear Tracks and Mesh

Figure 6.2: Quadrilateral Mesh using Linear Rails and Curved Rails

# Sizing & Anisotropy Control

- Normal Direction (p1)
  - Intervals/Layers Along Rails
  - Non-linear Rails
- Tangential Direction (p2 & p3)
  - Quad mesh using Skeleton Sizing
  - Track Width using Radius Function
- Local Control via Map

# Acknowledgements

- Author would like to thank Geoff Butlin, Mark Gammon, Robin Fairey, Henry Bucklow, and Jean Lu for providing CADFix MO library and integrating it with CUBIT.

Thank You
