Meeting with University of Guadalajara and CINVESTAV
19 May 2011

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin Company, for the United States Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

Porque se llama “Laboratório Sandía”

No por la fruta,

sino por la montaña de Sandía.

Así se llama.

- This presentation will illustrate vibration and dynamic testing and modeling.

- A laser Doppler vibrometer (LDV) in the optical train of a microscope measures the motions of MEMS.
- Laser spot has $\sim 1 \mu\text{m}$ diameter .
- A vacuum chamber enables testing at various pressures.

Sensor Testing Examples

kg) mass attached.

Dynamics of a MEMS Mirror

Hexagonal mirror is actuated by three actuators.

Espejo con
tres
actuadores

9

- Electrostatic actuation, measured.

Three actuators enable three degrees of freedom:

- Vertical
- Tilt about x
- Tilt about y

- Mirror array enables many types of optical processing.

Step voltage to one actuator causes tilting.

Espejo con
tres
actuadores

10

- Only Actuator A was connected.
- Actuators B and C were grounded.
- **Measured** motion is shown here.

Step voltage to three actuators causes vertical lifting.

Stepped from 0V to 149V to 0V.
Actuators A, B and C were connected

Return motion is slowed down by gas damping.

Amortiguación
de movimiento por
gas

12

- Squeeze-film damping slows down the motion significantly.
 - especially when the mirror is close to the substrate.
- Squeeze-film damping needs to be studied and understood in design.

Squeeze-Film Damping in MEMS

Squeeze-film damping in the free molecular regime: model validation and measurement on a MEMS

Hartono Sumali

Sandia National Laboratories, MS 1070, PO Box 5800, Albuquerque, NM 87185, USA

Gas damping is important in MEMS.

Motivation:

- Many micro/nano devices need high Q factor. Examples abound in
 - MEMS switches need high speed (high Q).
 - Resonant cantilever sensors need high responses.
 - MEMS gyroscopes.
 - MEMS accelerometers need controlled damping.
- Damping can reduce Q from several hundred thousands to below ten.
- Squeeze-film damping determines the dynamics of plates moving a few microns above the substrate.
- Continuum models are not known to be valid in rarefied (free molecule) regime.
- Molecular-dynamics-based models for predicting squeezed-film damping give different results.
 - So which model should one use?
 - Need experimental validation!
- Published experimental data were obtained for squeeze-film damping on *flexible* structures. Have been used to validate theory derived for *rigid* structures.

Objective:

- Provide experimental validation to squeezed-film damping models for rigid plates.

Squeezed fluid damps oscillation.

15

Plate oscillates at frequency ω .

The squeezed fluid between the plate and the substrate creates damping forces on the plate.

Present measurement was done on an oscillating plate.

- Structure is electro-plated Au.
- Thickness around $5.7 \mu\text{m}$.
- Substrate is alumina.

$$A = 29717(\mu\text{m})^2$$

$$a = 154.3 \mu\text{m}$$

Air gap between plate and substrate
Mean thickness = $4.1 \mu\text{m}$.

- Assumed width a and length b ,
where $ab = \text{true plate area}$.

Measurement uses LDV and vacuum chamber.

Amortiguación

por gas

17

- Substrate (base) was shaken with piezoelectric actuator.
- Scanning Laser Doppler Vibrometer (LDV) measures velocities at base and at several points on MEMS under test.

Experimental modal analysis gives natural frequency, damping and mode shapes.

Measured deflection shape, first mode.

16910Hz. Up-and-down.

Higher modes are not considered.

- Tests were repeated at different air pressures from atmospheric (640 Torr) to near-vacuum (<1 milliTorr).

Test data were compared with several theories.

19

- Blech model is valid only for low Knudsen numbers.
- Andrews et al's limit is accurate at low K_s .
- Literature¹ showed Bao et al's model to be more accurate after modification.
- Gallis-Torczynski model agrees well with test data.
- Veijola's model agrees very well with test data.

Conclusions

Fig. 5. Equivalence between 3-D FEM and 1-D model.

- Dynamics is important in MEMS.
- Laser Doppler vibrometry enables high-resolution measurement of MEMS motion.
- We have seen the measurement of the vibration modes of an AFM probe cantilever, and a cantilever array capable of detecting ten picograms of mass.
- We have studied the dynamics of a hexagonal mirror with three actuators.
- Squeeze-film damping slows down the motion.
- Experimental study of squeeze-film damping validate two theories and invalidate most of other theories.
- Sandia National Laboratories conduct extensive research on MEMS, and collaborates with many universities and private companies.

Many people from Sandia National Laboratories in Albuquerque, New Mexico, USA contribute to this presentation.

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin Company, for the United States Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.
