

# PA Cluster access through SRNGATE

*Seth King*

December 10, 2019

DRAFT - DO NOT CITE OR DISTRIBUTE

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525. This research is funded by WIPP programs administered by the Office of Environmental Management (EM) of the U.S. Department of Energy.

# Main Sandia PA Cluster

The head node for the PA computing cluster is: **santana.sandia.gov**

Santana is a Oracle Sun server running SunOS 5.11

Some codes are ran directly on the head node, some codes are distributed to other nodes by the run control scripts that are launched on the head node (Using Oracle Grid Engine).

Remote connections must go through **srngate.sandia.gov**, then ssh into **santana.sandia.gov**

Srngate will only give terminal access to the cluster, no file transfer or Xwindow tunneling is available.

- Any simple ssh program will work to connect to srngate

**jt.sandia.gov** is the PA linux test server

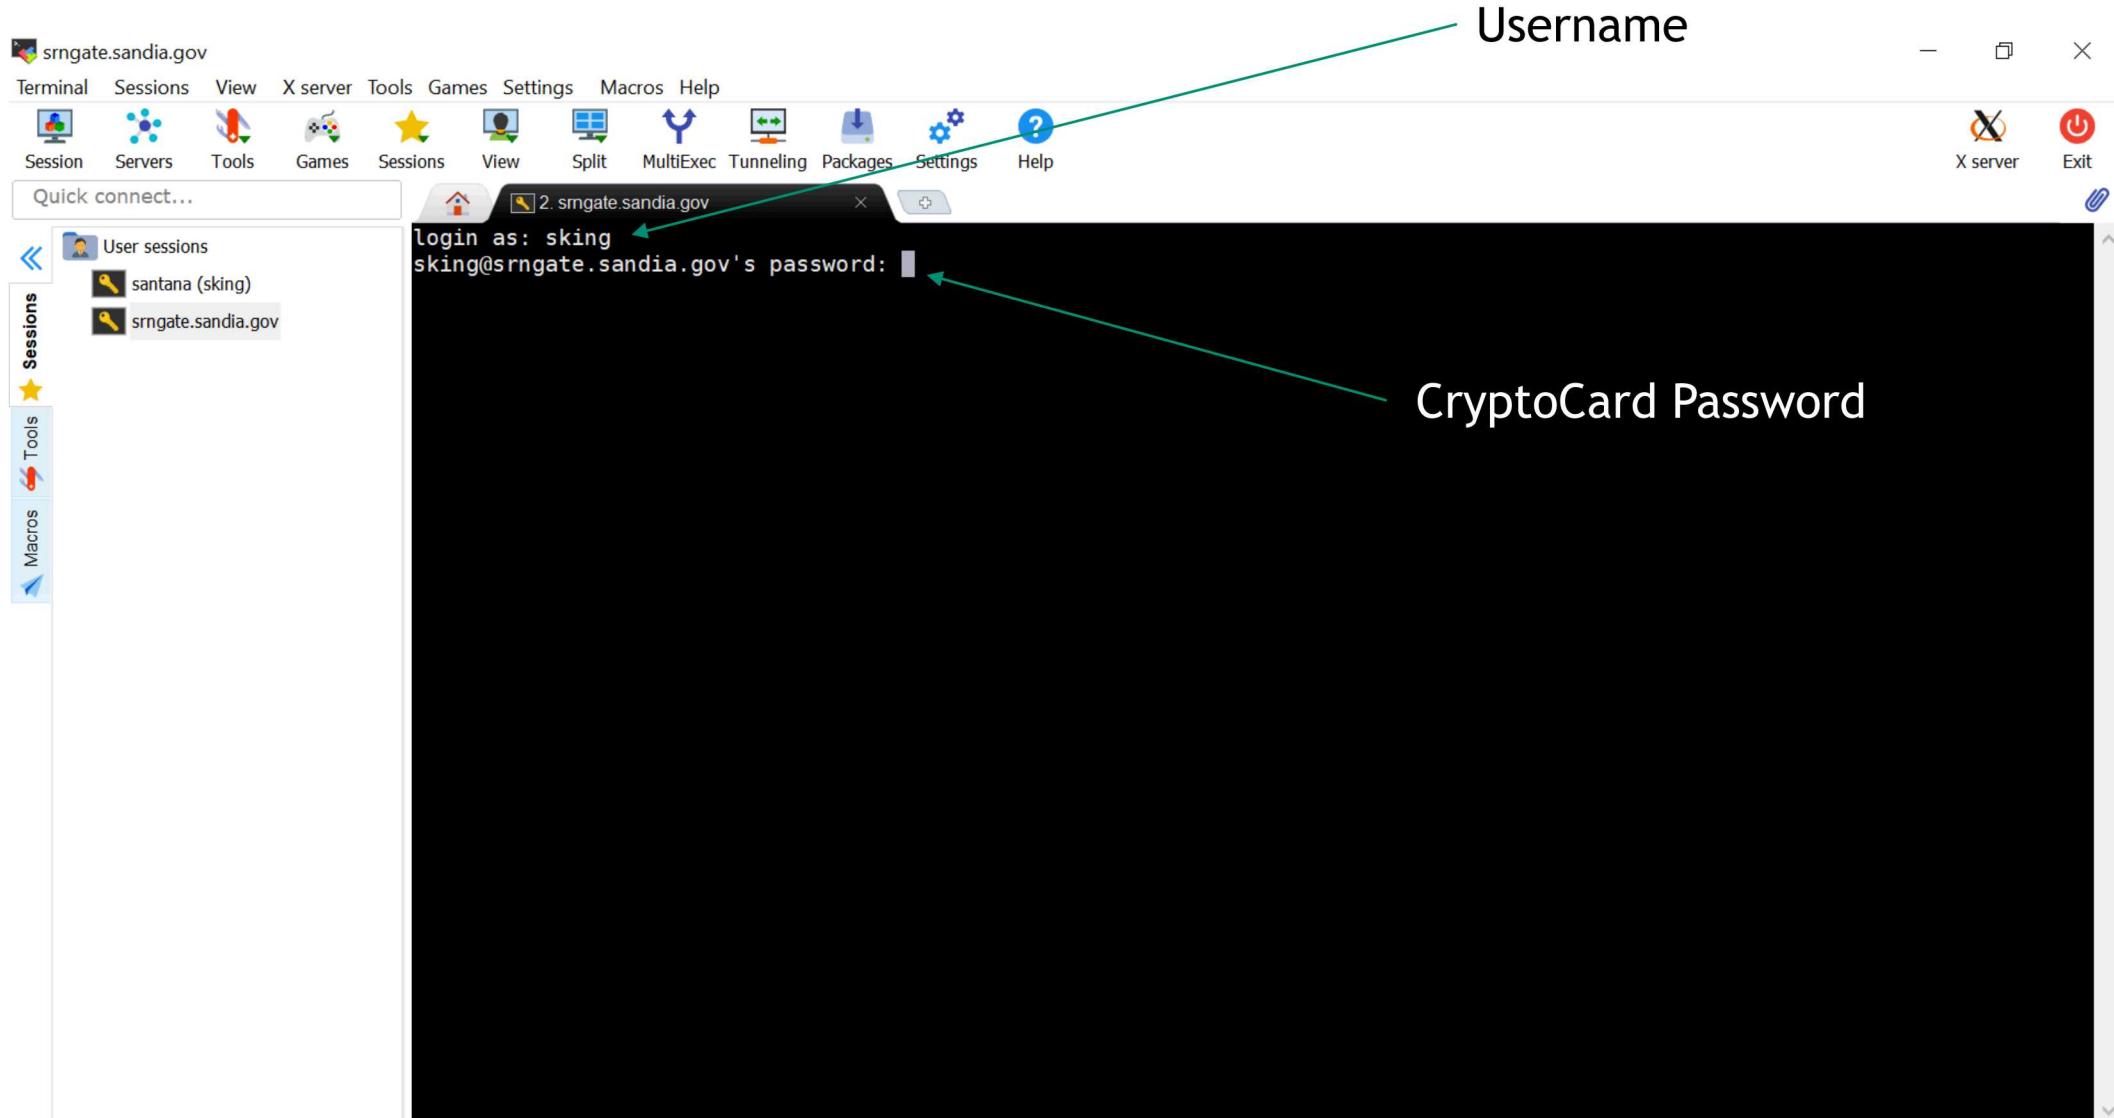

Jt is a linux server running CentOS 7.

The Santana home area is mapped to /home1 on Jt.

Solaris has limited python support, so when more advanced python capabilities (numpy, pandas, MySQLdb, etc.) are needed Jt can be utilized.

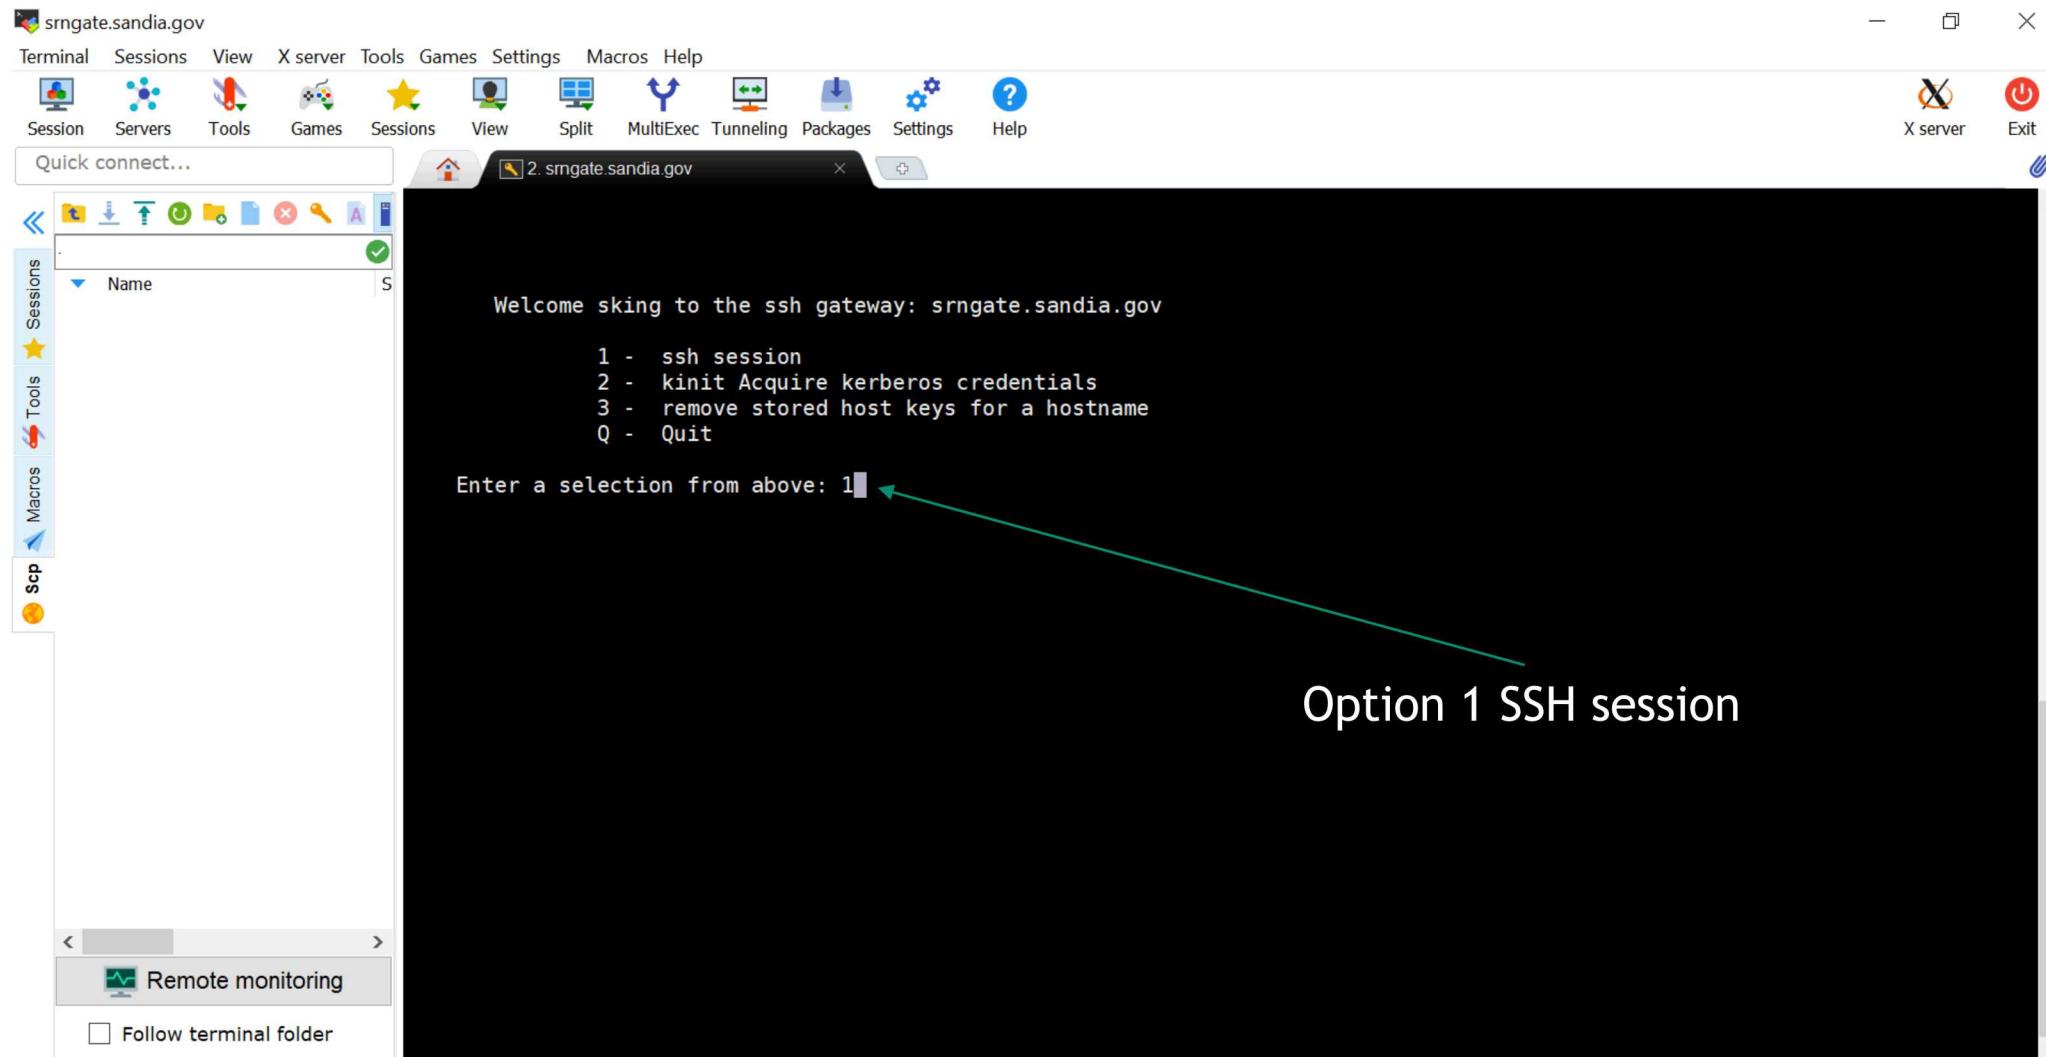

**bto.sandia.gov** is the database server.
