

PROJECT NAME:  
LIDAR For Heliostat Optical Error Assessment  
PI: Dan Small email: [desmall@sandia.gov](mailto:desmall@sandia.gov)  
Sandia National Labs  
Award #39953

- BACKGROUND / INDUSTRY IMPACT**
- No tool currently exists that directly assesses optical canting errors efficiently and accurately in commercial heliostat fields.
  - Sandia is developing a LIDAR-based approach to assess optical canting and pointing errors in large commercial heliostat fields.
  - System will measure canting and pointing errors, and provide feedback for making canting error corrections.

- PROJECT OVERVIEW / OBJECTIVES**
- Develop efficient *in-situ* methods to assess and quantify heliostat field optical errors such as canting and pointing errors.
  - Develop software to drive a commercial LIDAR system automatically without user intervention for direct 3D data collections.

- METHODS**
- Use a commercial off the shelf LIDAR sensor for direct measurement of a dense 3D point cloud of the heliostat mirror surfaces
  - Use segmentation and statistical analysis to derive heliostat optical errors
  - Improve the heliostat field performance using the 3D survey results.
  - Make the system usable in unmanned systems to realize autonomous survey of a commercial-scale heliostat field

- KEY OUTCOMES / MILESTONES**
- ✓ Procure an appropriate LIDAR sensor with software API amenable to autonomous measurement. Success metric: LIDAR sensor shall be able to power on, acquire target images and scan the surrounding area in 3D, under completely remote operation. measurement by UFACET and NIO methods.
  - ✓ We have demonstrated successful data collection using LIDAR at the NSTTF and Crescent Dunes heliostat fields.
  - ✓ Demonstrated 1) automatically take a scan and retrieve scan data to a computer, 2) segment the data down to individual heliostats, and then 3) automatically segment each individual heliostat into 25 separate facets which can then be analyzed for canting errors.

- CONCLUSION / REMAINING RISK**
- The tool was developed and validated with the field data.
  - LIDAR shows promise for automating heliostat optical error assessment
  - Need to identify potential commercial partners for field demonstration.

CONCENTRATING SOLAR-THERMAL POWER TRACK

A *LIDAR technique* has been *demonstrated to directly measure the canting errors of heliostat mirrors*, and can similarly be applied to *measure the pointing error of heliostats*.

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.
