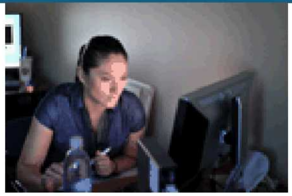
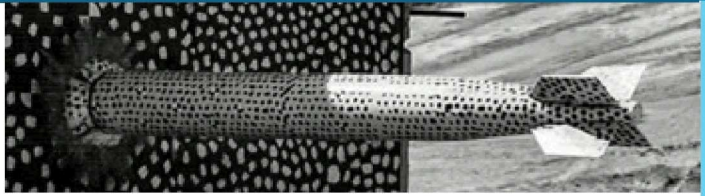
Experimental quantum technologies at Sandia National Laboratories





PRESENTED BY

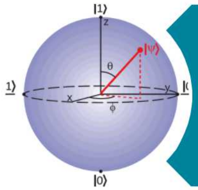
Hayden McGuinness

Photonic Microsystems Technologies

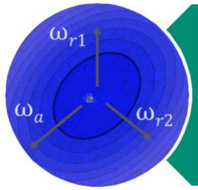
Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

Outline

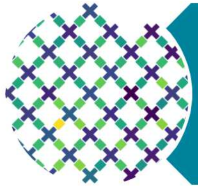
History of Sandia, quantum technology capabilities



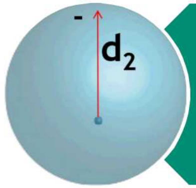
Intro to quantum information science (QIS)



Ions: QSCOUT + TICTOC



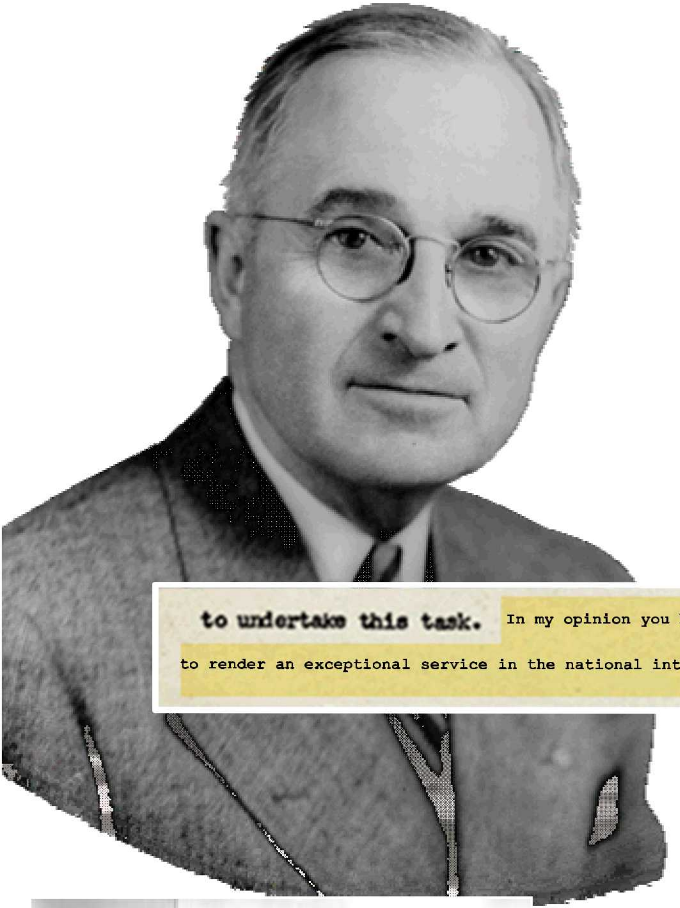
Superconductors: Transmons + transduction



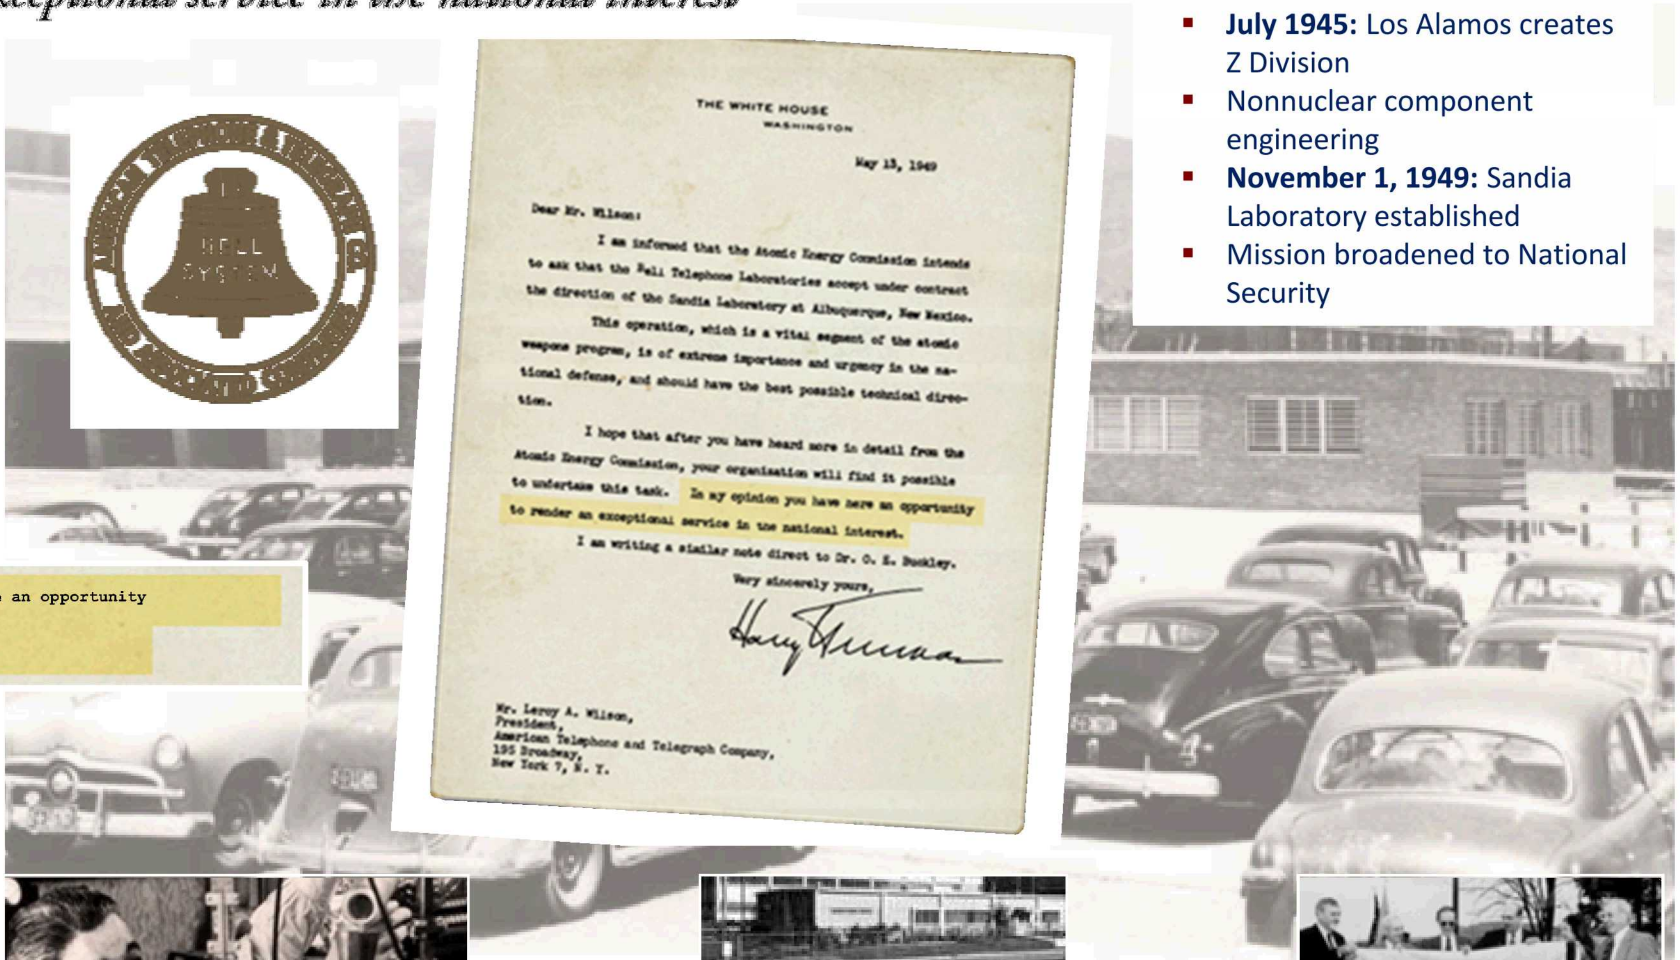
Neutrals: Rydberg + SIGMA + OPM MEG

Sandia National Laboratories

Exceptional service in the national interest



to undertake this task. In my opinion you have here an opportunity
to render an exceptional service in the national interest.



THE WHITE HOUSE
WASHINGTON

May 13, 1949

Dear Mr. Wilson:

I am informed that the Atomic Energy Commission intends to ask that the Bell Telephone Laboratories accept under contract the direction of the Sandia Laboratory at Albuquerque, New Mexico.

This operation, which is a vital segment of the atomic weapons program, is of extreme importance and urgency in the national defense, and should have the best possible technical direction.

I hope that after you have heard more in detail from the Atomic Energy Commission, your organization will find it possible to undertake this task. In my opinion you have here an opportunity to render an exceptional service in the national interest.

I am writing a similar note direct to Dr. O. E. Buckley.

Very sincerely yours,

Harry Truman

Mr. Leroy A. Wilson,
President,
American Telephone and Telegraph Company,
195 Broadway,
New York 7, N. Y.

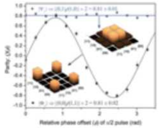
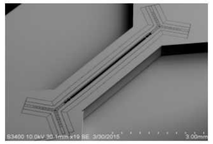
AQUARIUS GC LDRD: Adiabatic QC (2011-13)



IBM Quantum Experience: 1st public access to QC (2016)

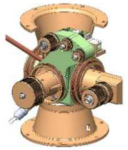
SECANT GC LDRD: QKD (2016-18)

IARPA LOGIQ: Microfabricated traps for a logical qubit (2016-2021)

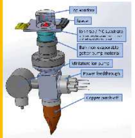


DOE/SC Quantum Science Open User Testbed (QSCOUT) (2018-22)

SIGMA GC LDRD: AI for inertial guidance (2018-20)



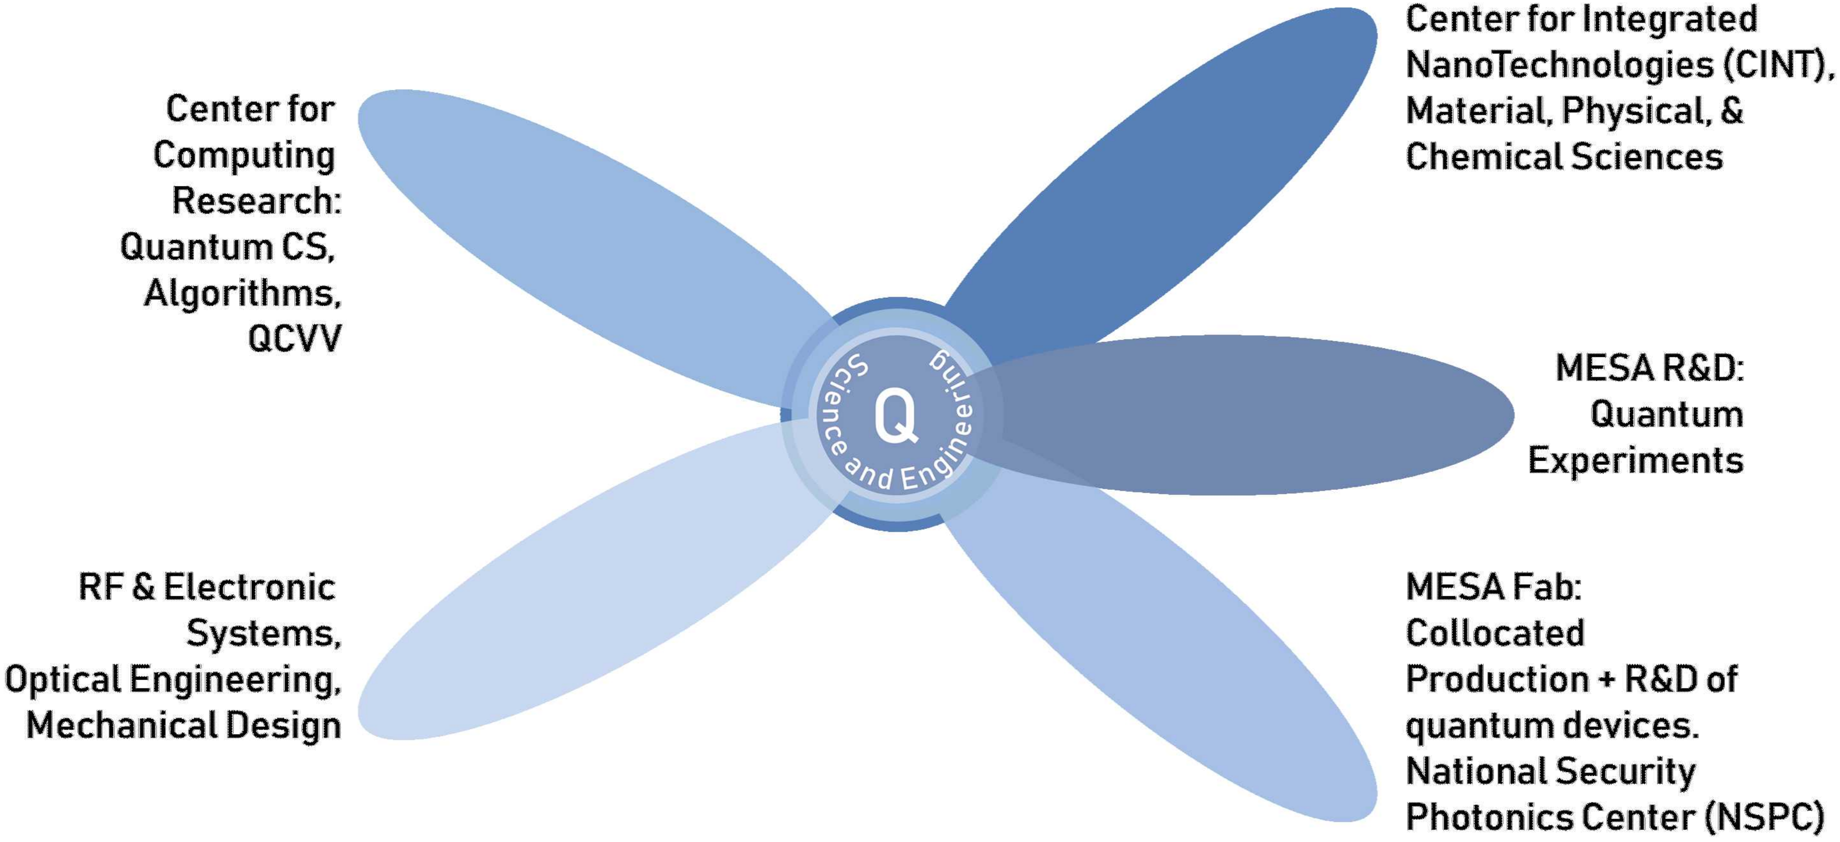
DARPA TICTOC: Ion optical clock (2019-21)



Sandia Quantum Information Science Organization Chart

QIS work at Sandia draws on skills and resources from across the Labs

- QIS is an exciting opportunity for Sandia's engineers and scientists
- QIS benefits from decades of collective experience in all relevant domains at Sandia
- Examples: QSCOUT, SIGMA, TICTOC



Center for Integrated NanoTechnologies (CINT)

DOE funded nano-science

- **Free** access to staff expertise and e
science
- Two proposal calls per year - short-t
accepted continuously

CINT Research Areas

In-situ characterization & na

- Dynamic response of materials a
mechanical, electrical, or other s

Nanophotonics & optical nan

- Synthesis, excitation, and energy t
active nanomaterials and electrom

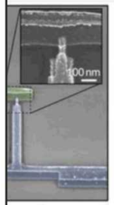
Soft, biological & composite na

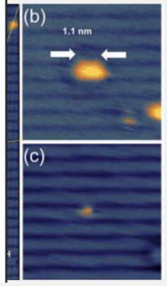
- Synthesis, assembly, and characteriz
and composite nanomaterials that dis

Quantum material systems

- Understanding and controlling quantum effects of nanoscale materials and their integration into systems spanning multiple length scales.

ails:





Materials synthesis

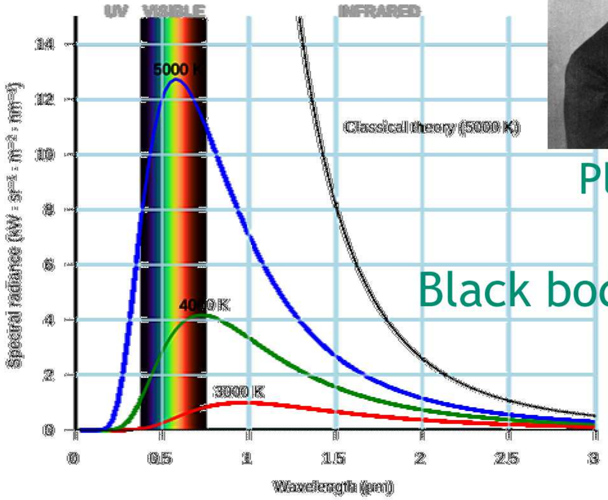
- Ultra-high mobility MBE
- Complex oxide PLD
- CVD nanowire growth

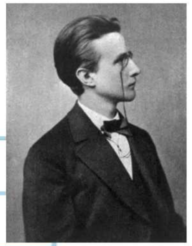
Correlated systems

- Mean-field modeling for quantum materials
- Many-body approaches

Quantum mechanics governs the physics of the small

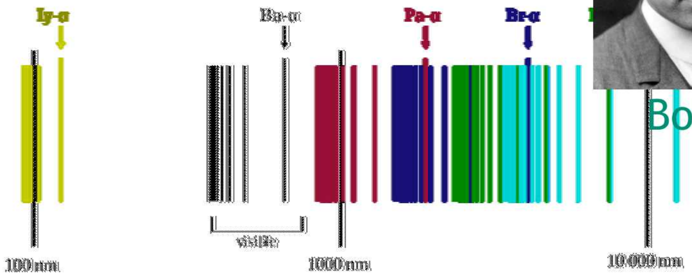
- Physics that governs the small: atoms, molecules, small devices
- Dramatically different behavior from large-scale effects





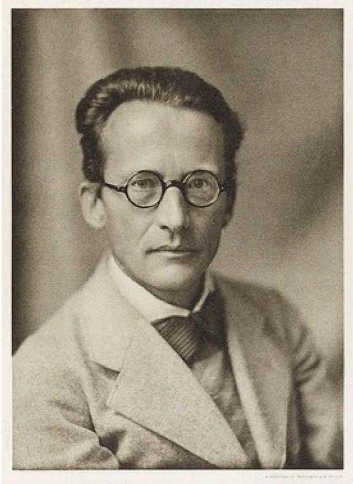
Planck

Black body radiation



Bohr

Hydrogen emissions wavelengths



Erwin Schrodinger

Werner Heisenberg

- A single theory resolved a number of conundrums and led to transistors, lasers, medical imaging, superconductors, …

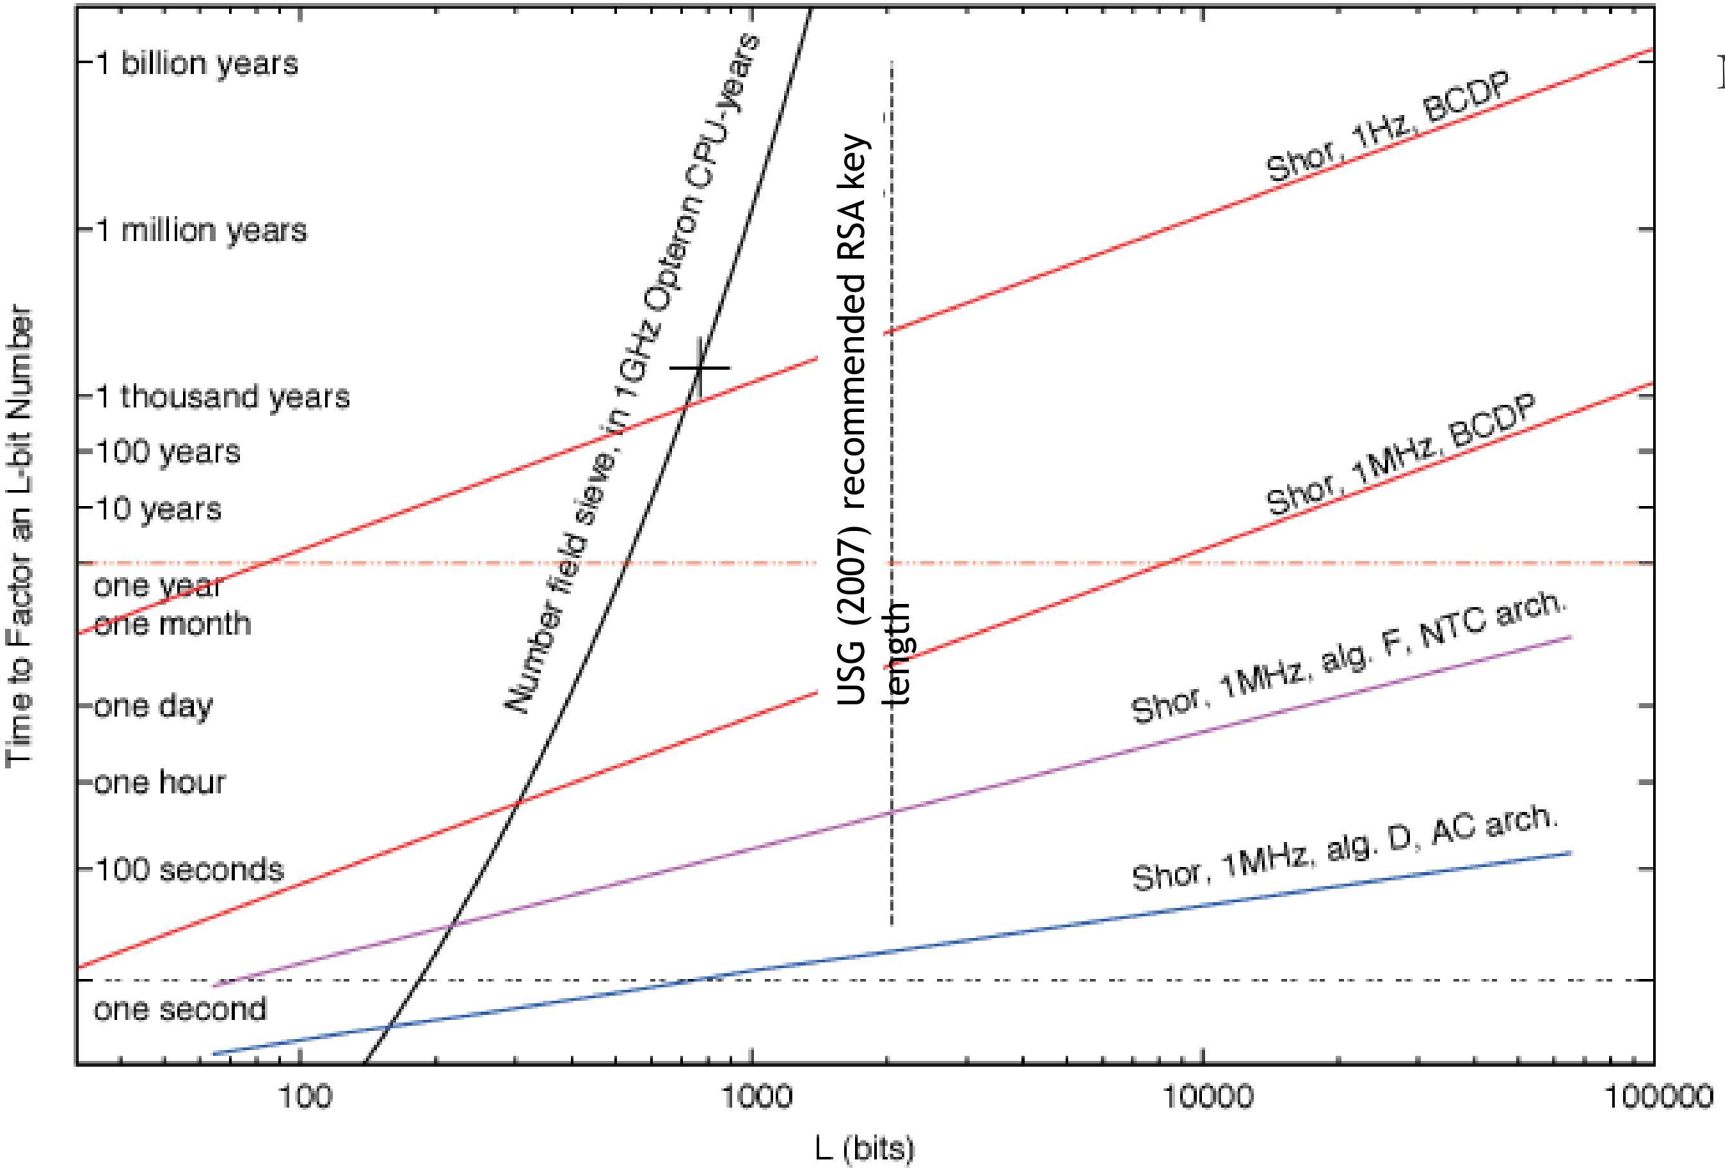
Quantum science impacts US national security

- "Unbreakable" cryptography based on the presumed difficulty of certain math problems could be readily cracked using a sufficiently large quantum computer
- "Unsolvable" problems in pharmaceuticals and energy science could be solved using a sufficiently large quantum computer
- Networked quantum communications are plausible in the near-term, and could be provably secure
- Quantum sensing and detection devices could improve sensitivity by 10-1000
- We still don't know the full landscape of applications

"The United States' large stake in all these potential applications warrants a cohesive national effort to achieve and maintain leadership in the rapidly emerging field of quantum information science."
-Dr. Jack Marburger, former DOSTP, 1/2009

From A Federal Vision for Quantum Information Science.

Quantum shakes the foundations of cryptanalysis



NIST recommended RSA key length:

- Classical (black): Requires trillions of years on a classical computer
- Quantum (red-purple): Could be solved in seconds-days on a quantum computer.

A blueprint for building a quantum computer, R. van Meter & C. Horsman, *Comm. ACM*, (2013) doi:10.1145/2494568

Quantum shakes the foundation of chemistry

- The Haber process converts nitrogen into ammonia, and consumes roughly 2% of the world's energy supply.

$$\underbrace{N_2 + 3\,H_2}_{\Delta H^\circ = 0\ \mathrm{kJ}} \longrightarrow \underbrace{2\,NH_3}_{\Delta H^\circ = -91.8\ \mathrm{kJ{\cdot}mol^{-1}}}$$

Fritz Haber

- The Haber process requires large factories with high temperatures and pressures, but plants perform nitrogen fixation every day.

- With technology that could be developed in the next 20 years, a quantum computer could unravel biological nitrogen fixation.

Elucidating Reaction Mechamisms on a Quantum Computer. Reiher et al., PNAS (2017)

Quantum is growing worldwide

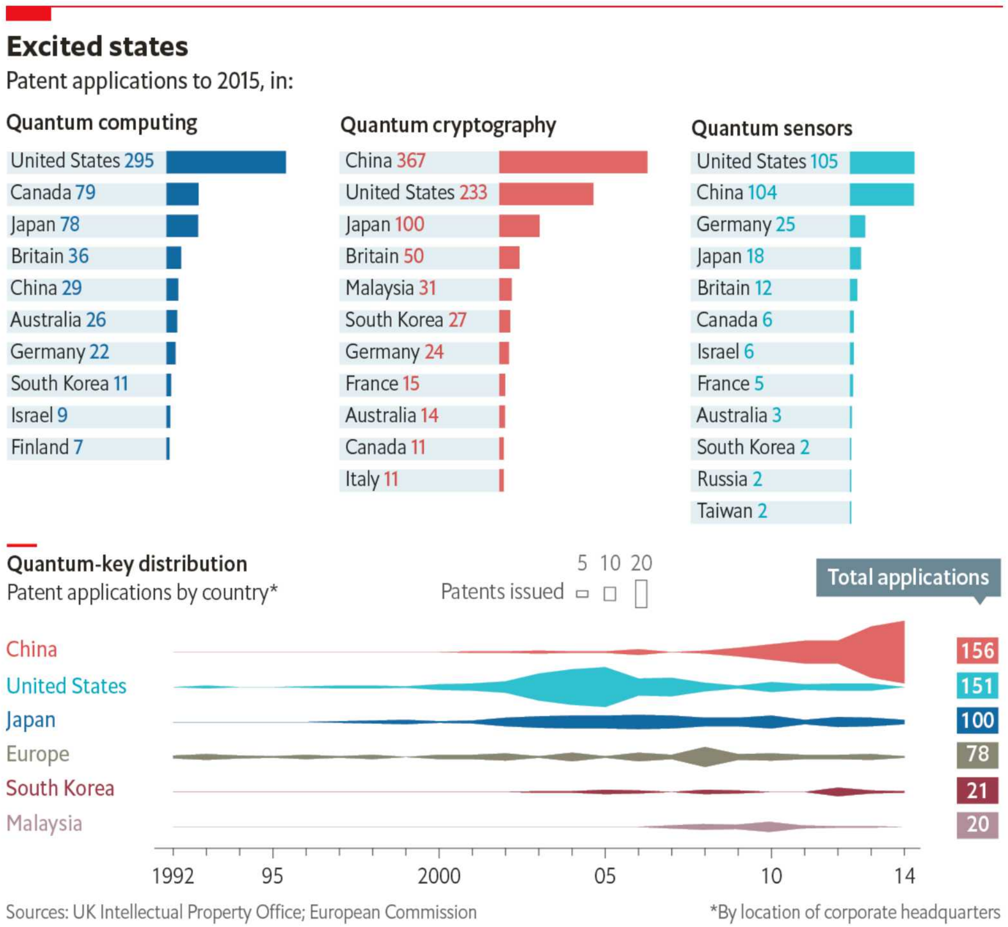
Patent Applications

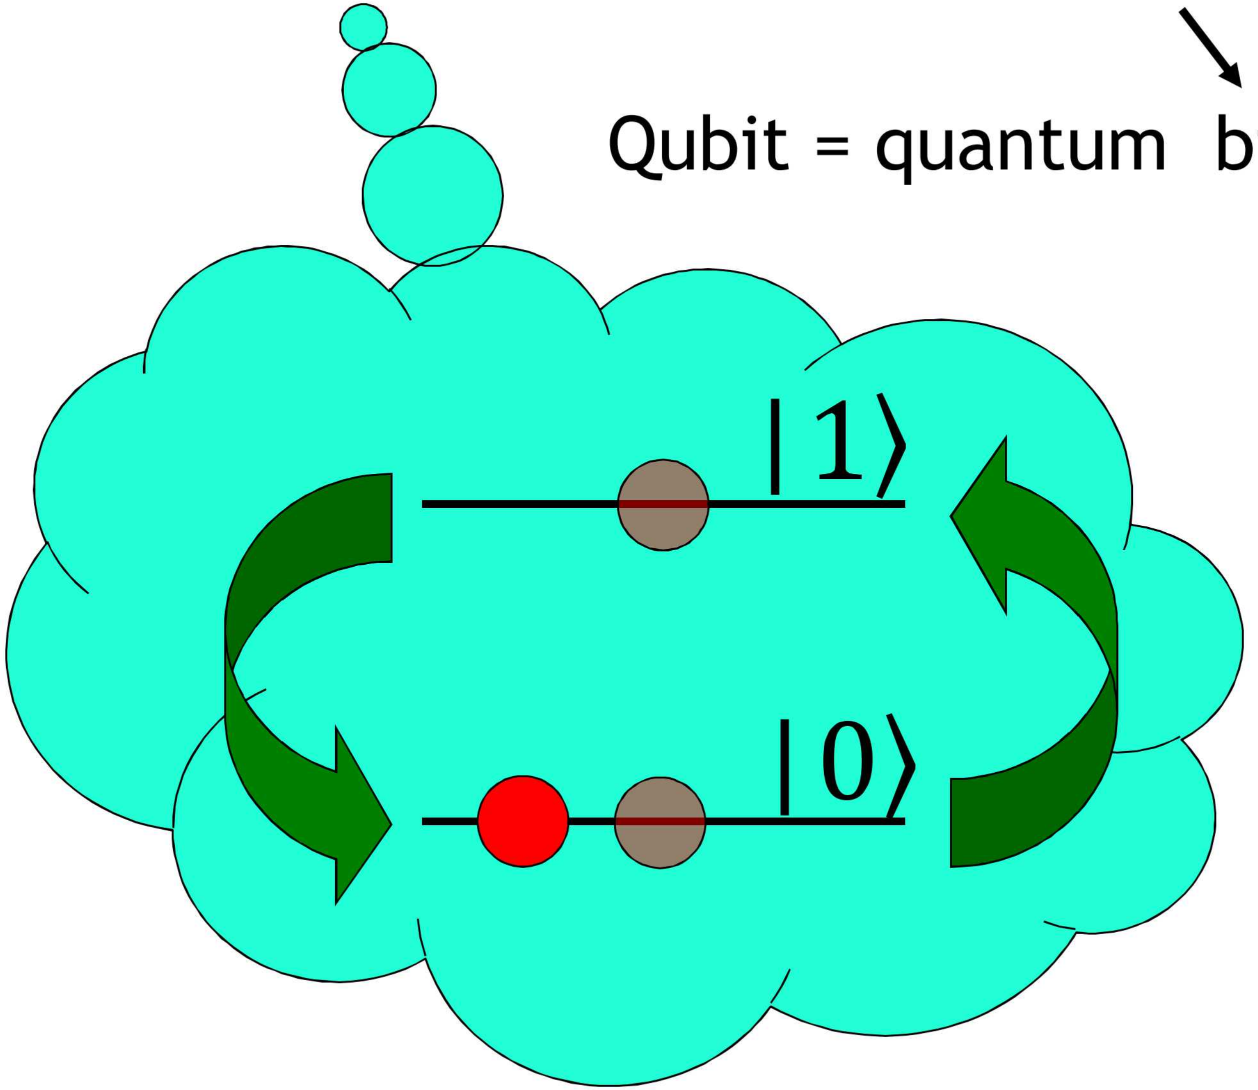


Quantum Technology is Beginning to Come Into Its Own. *Economist*, 2017

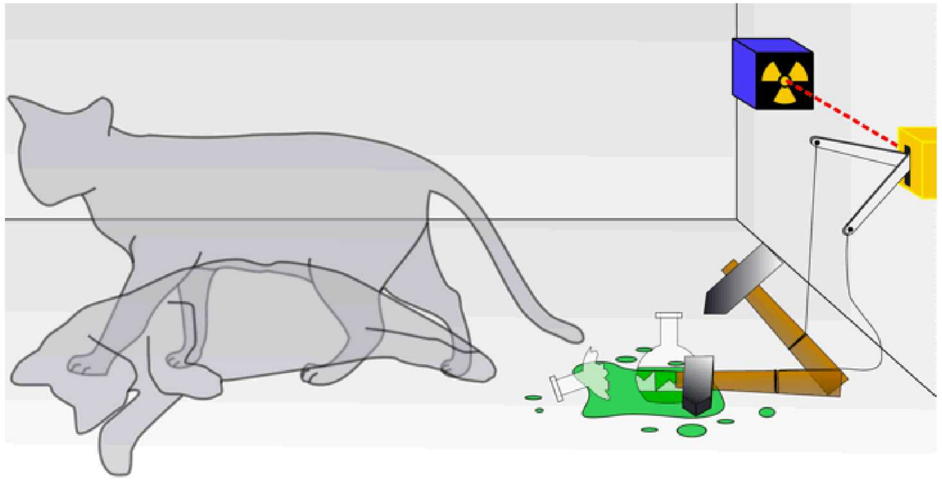
What is a qubit?

01110001011
01010100010

Qubit = quantum bit



- stable



$$|0\rangle \rightarrow \alpha|0\rangle + \beta|1\rangle$$

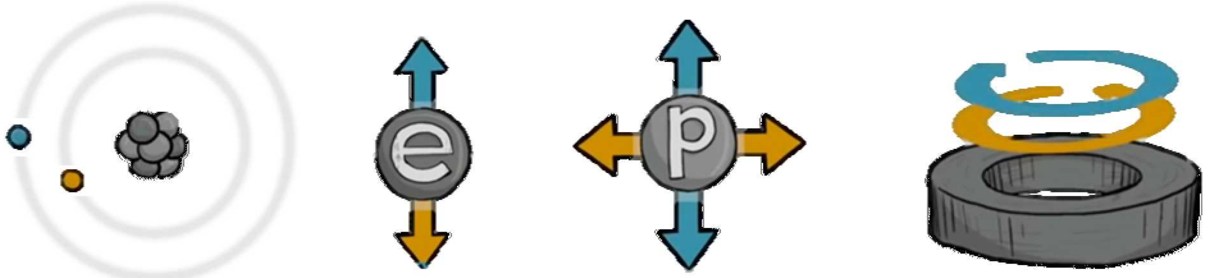
$$(|\alpha|^2+|\beta|^2 = 1)$$

$$|0,0\rangle \rightarrow \alpha|0,1\rangle + \beta|1,0\rangle$$

Requirements for building a quantum computer

The DiVincenzo criteria

1. Scalable physical system with well characterized qubits
2. The ability to initialize qubits to a simple state
3. Long decoherence times, >> than the gate times
4. A "universal" set of quantum gates
5. Qubit-specific measurement capability



Atomi c **Electron spin** **Photon polarizatio** **Superconducti ng**

The vast majority of what a quantum computer will do is correct its own errors.

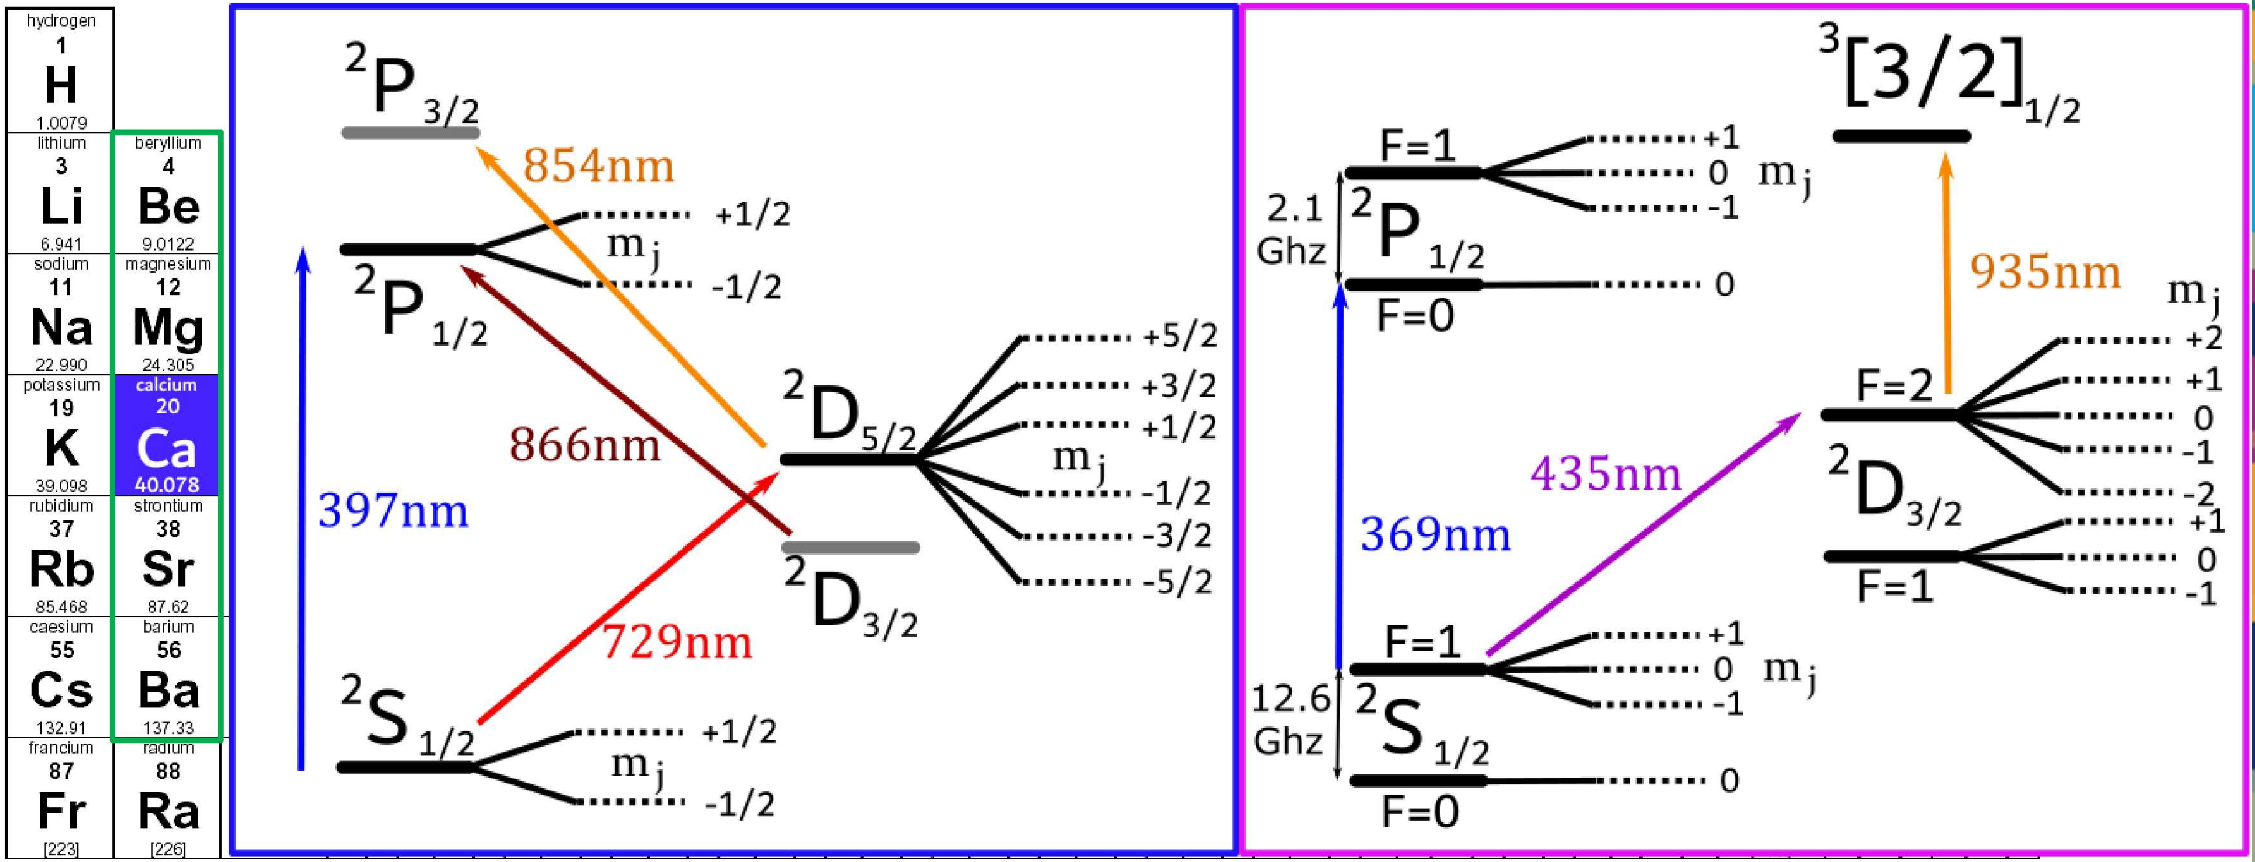
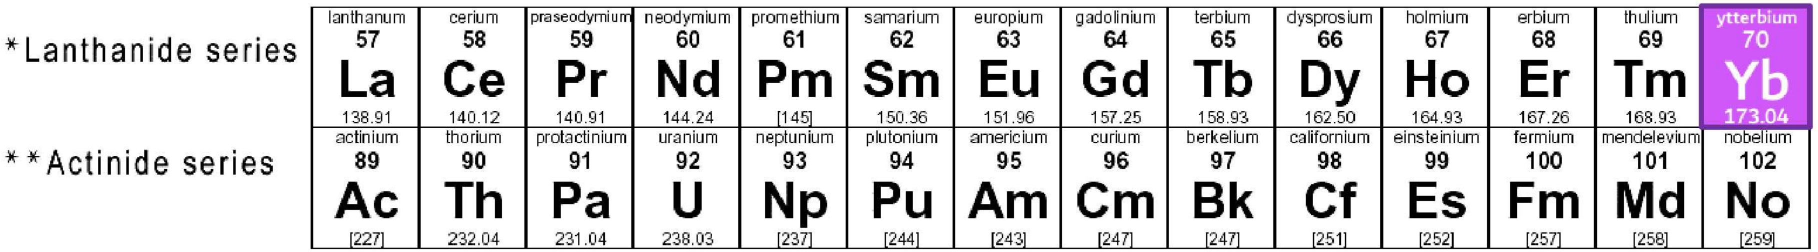
ions

QSCOUT

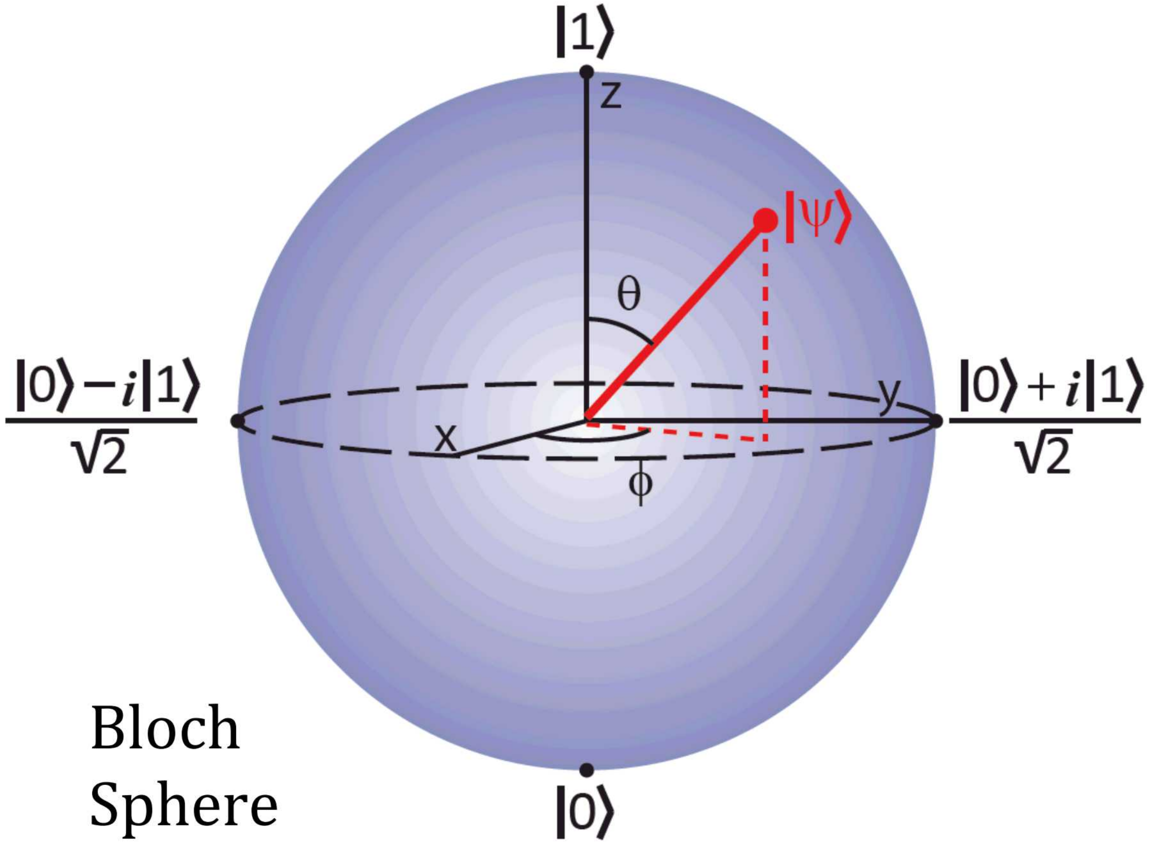
TicToc

Two common ion species: $^{171}Yb^{+}$ and $^{40}Ca^{+}$





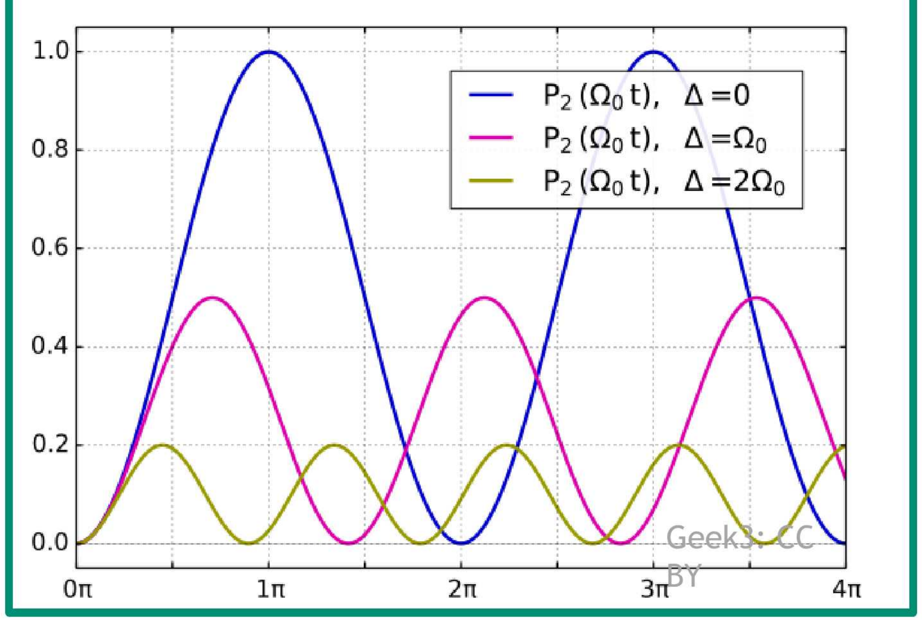
Single qubit operations, internal/external DoF

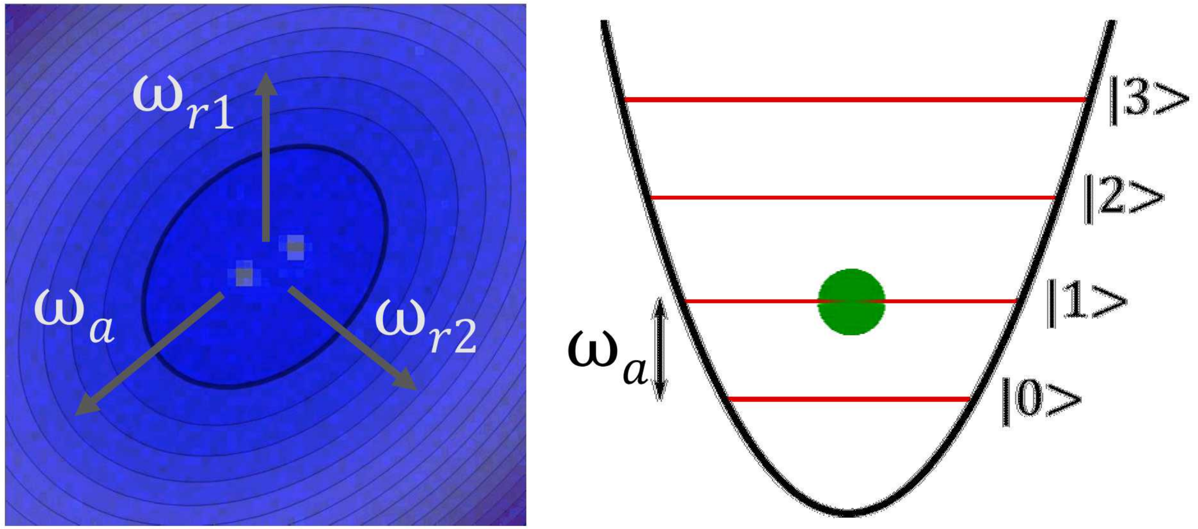


Bloch Sphere

$$|\Psi> = \sin\left(\frac{\theta}{2}\right)|0> + e^{i\phi}\cos\left(\frac{\theta}{2}\right)|1>$$

Mizrahi, J. (2013). *[Previous reference]*





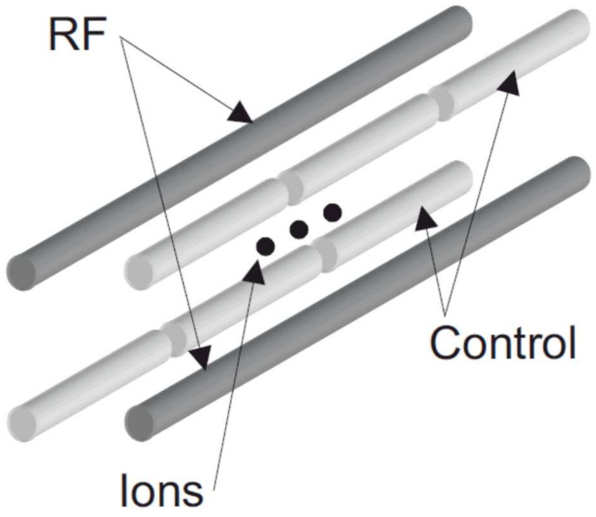
Trapology: 3D vs Surface traps

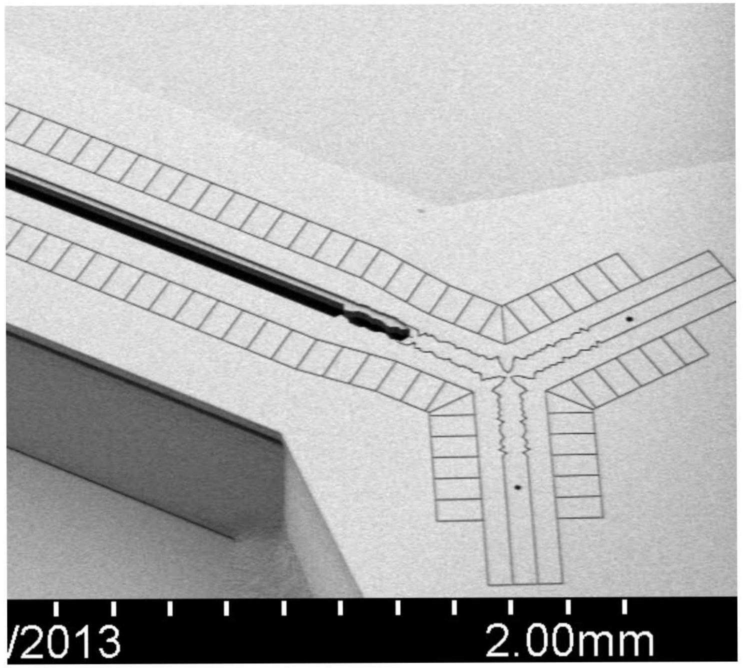
Advantages

- More manufacturable ("scalable")
- Consistent geometry = consistent behavior
- Greater field control (more electrodes)
- 2D geometry
- Integration of other technologies (waveguides, detectors, filters…)
- Laser access

Challenges

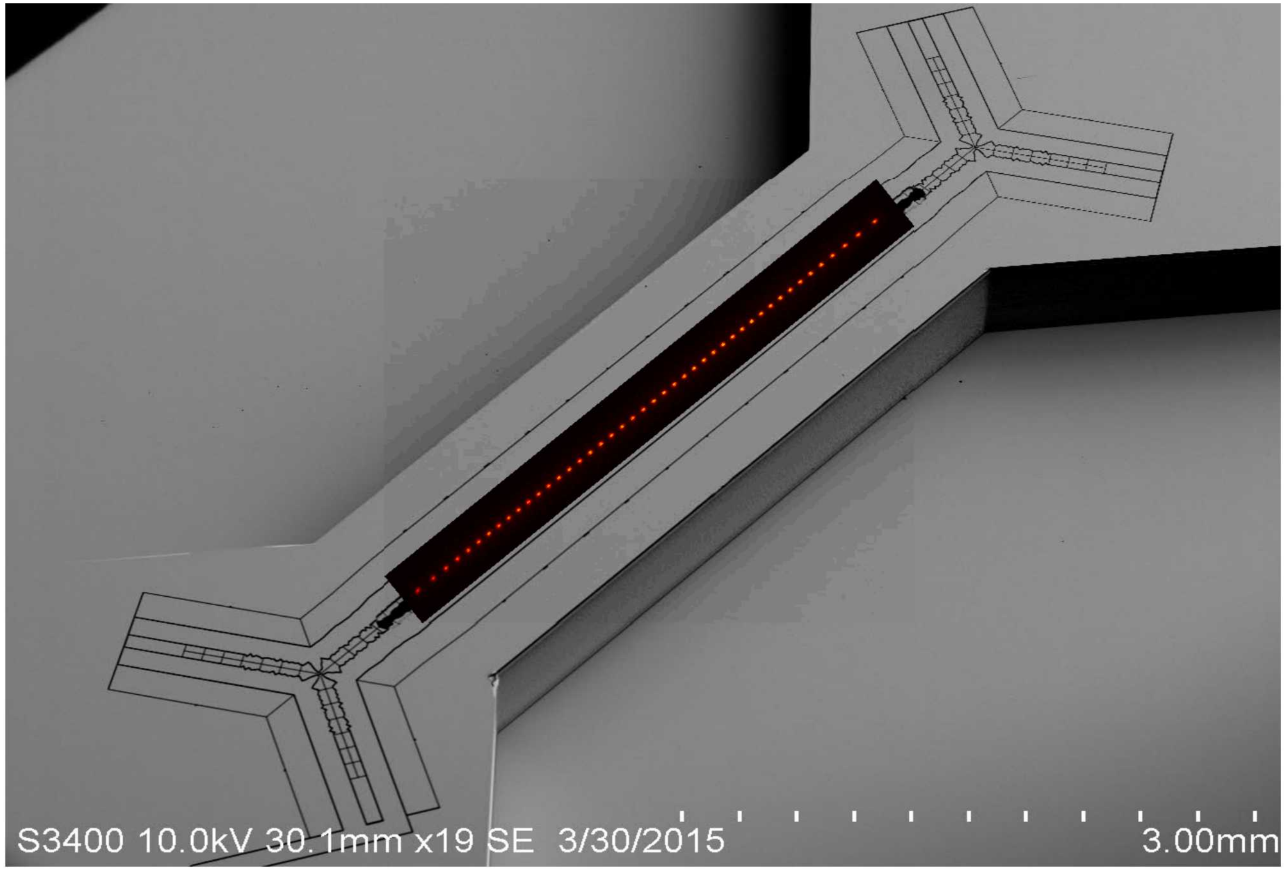
- Low depth (ion lifetime), anharmonicities in potential
- Proximity to surface (charging, heating)
- Delicate (dust, voltage)
- Capacitance



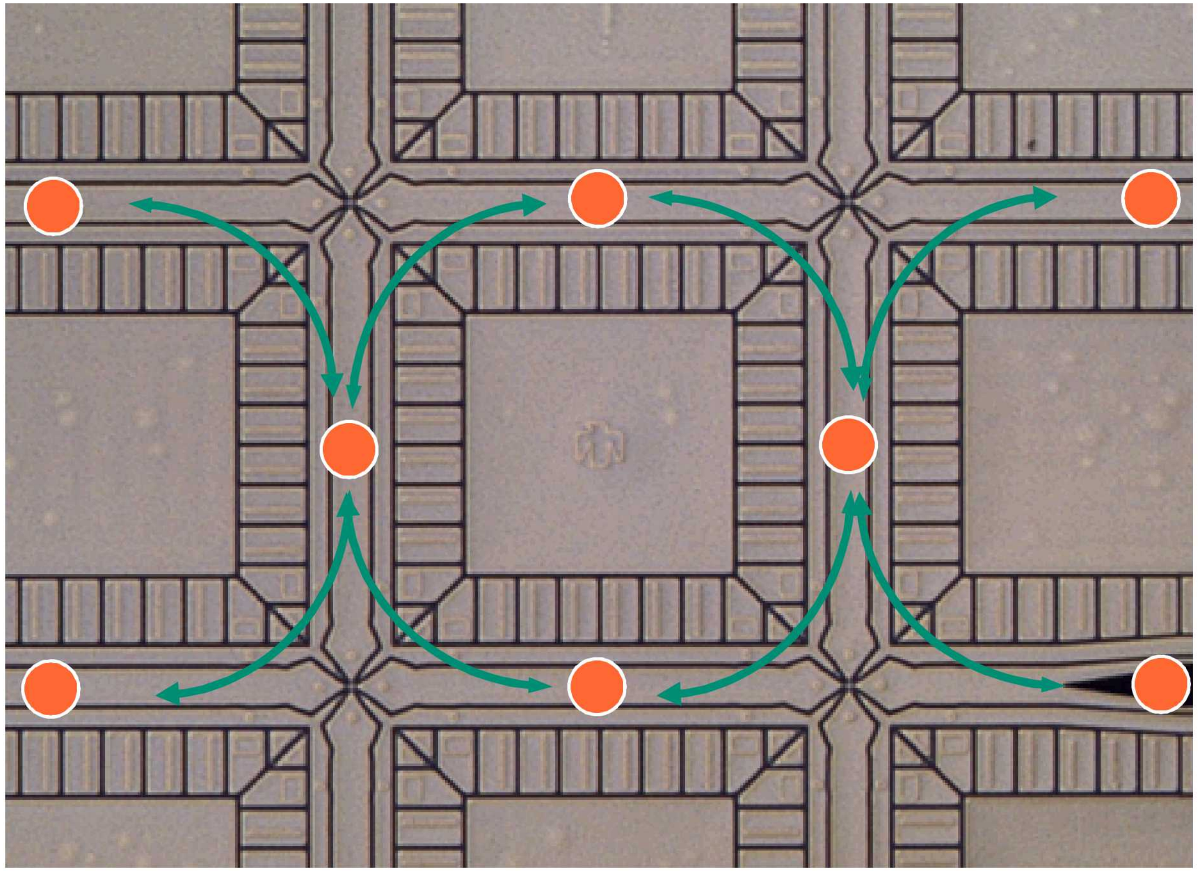


Surface trap architecture

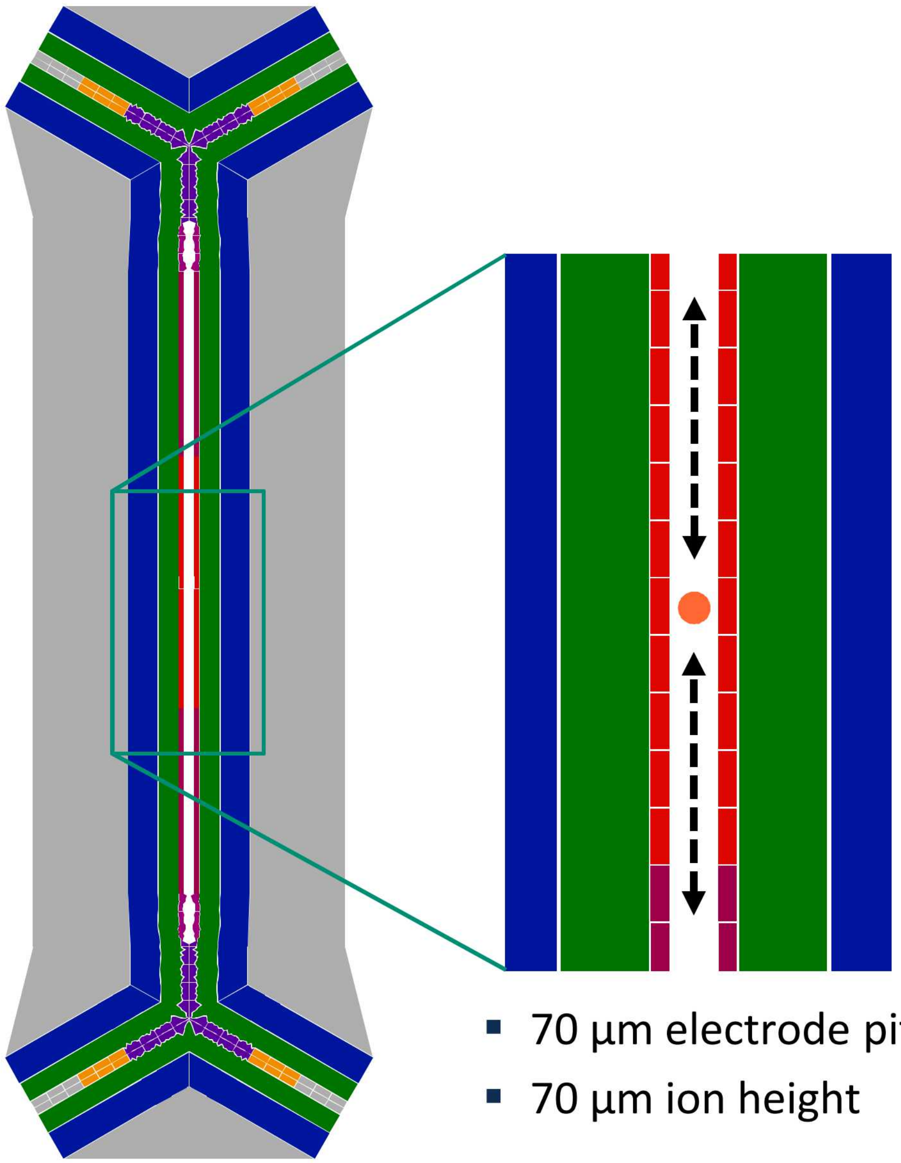
MUSIQC architecture

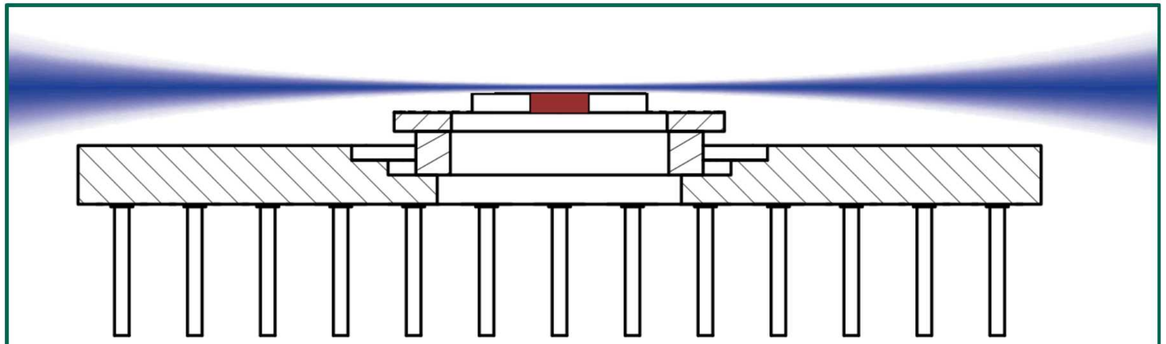


Quantum CCD

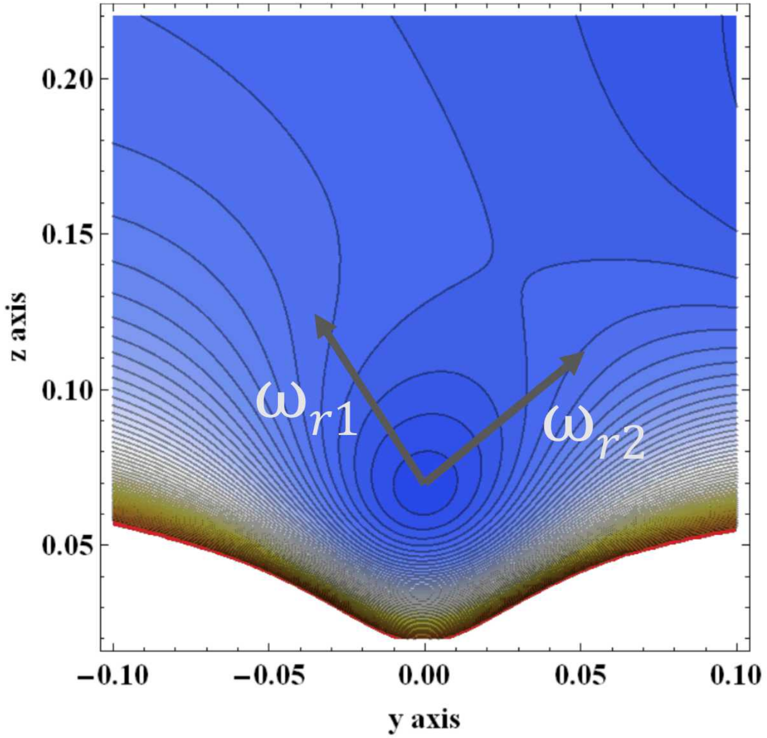


High optical access 2 (HOA2)





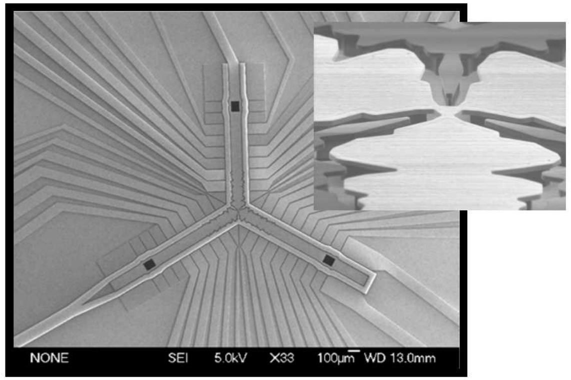
Can accommodate 4/2 um beam waist (369 nm)



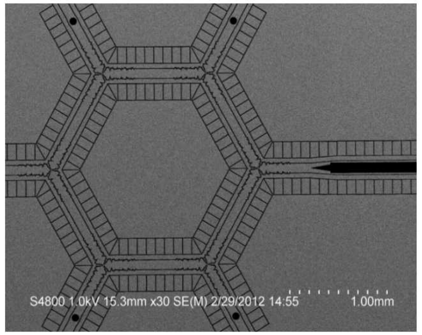
- 70 μm electrode pitch
- 70 μm ion height

Some of Sandia's Traps

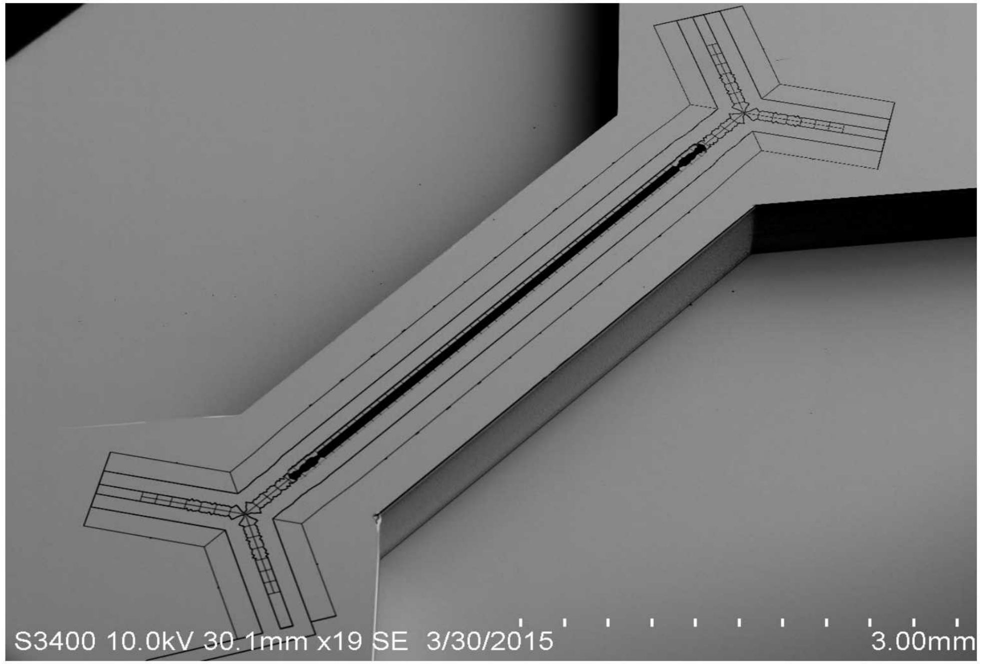
Y-junction traps



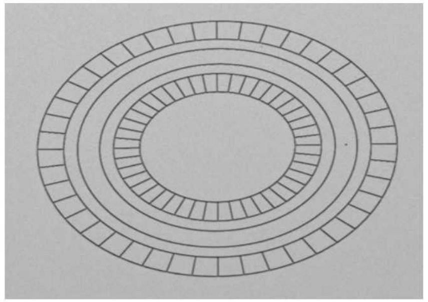
Circulator trap

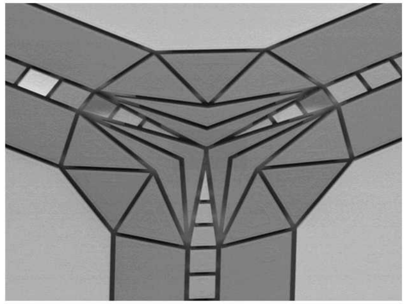


High Optical Access (HOA) trap



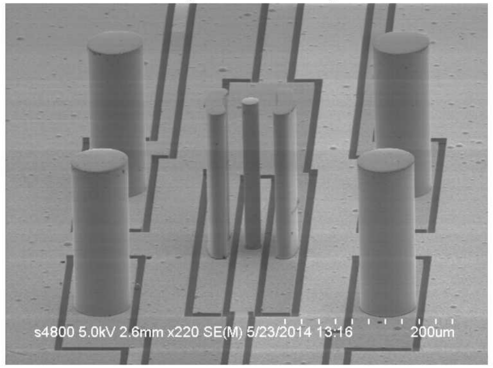
Ring trap:



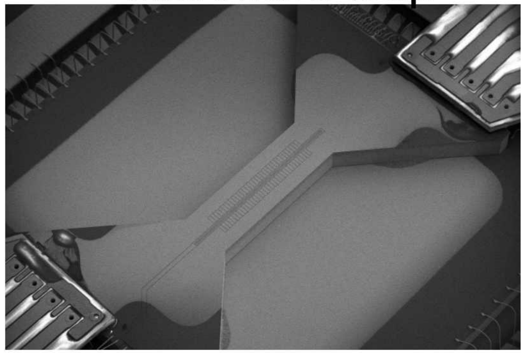


Switchable RF trap

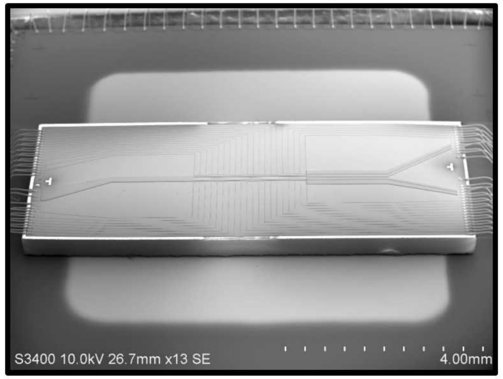
Stylus trap



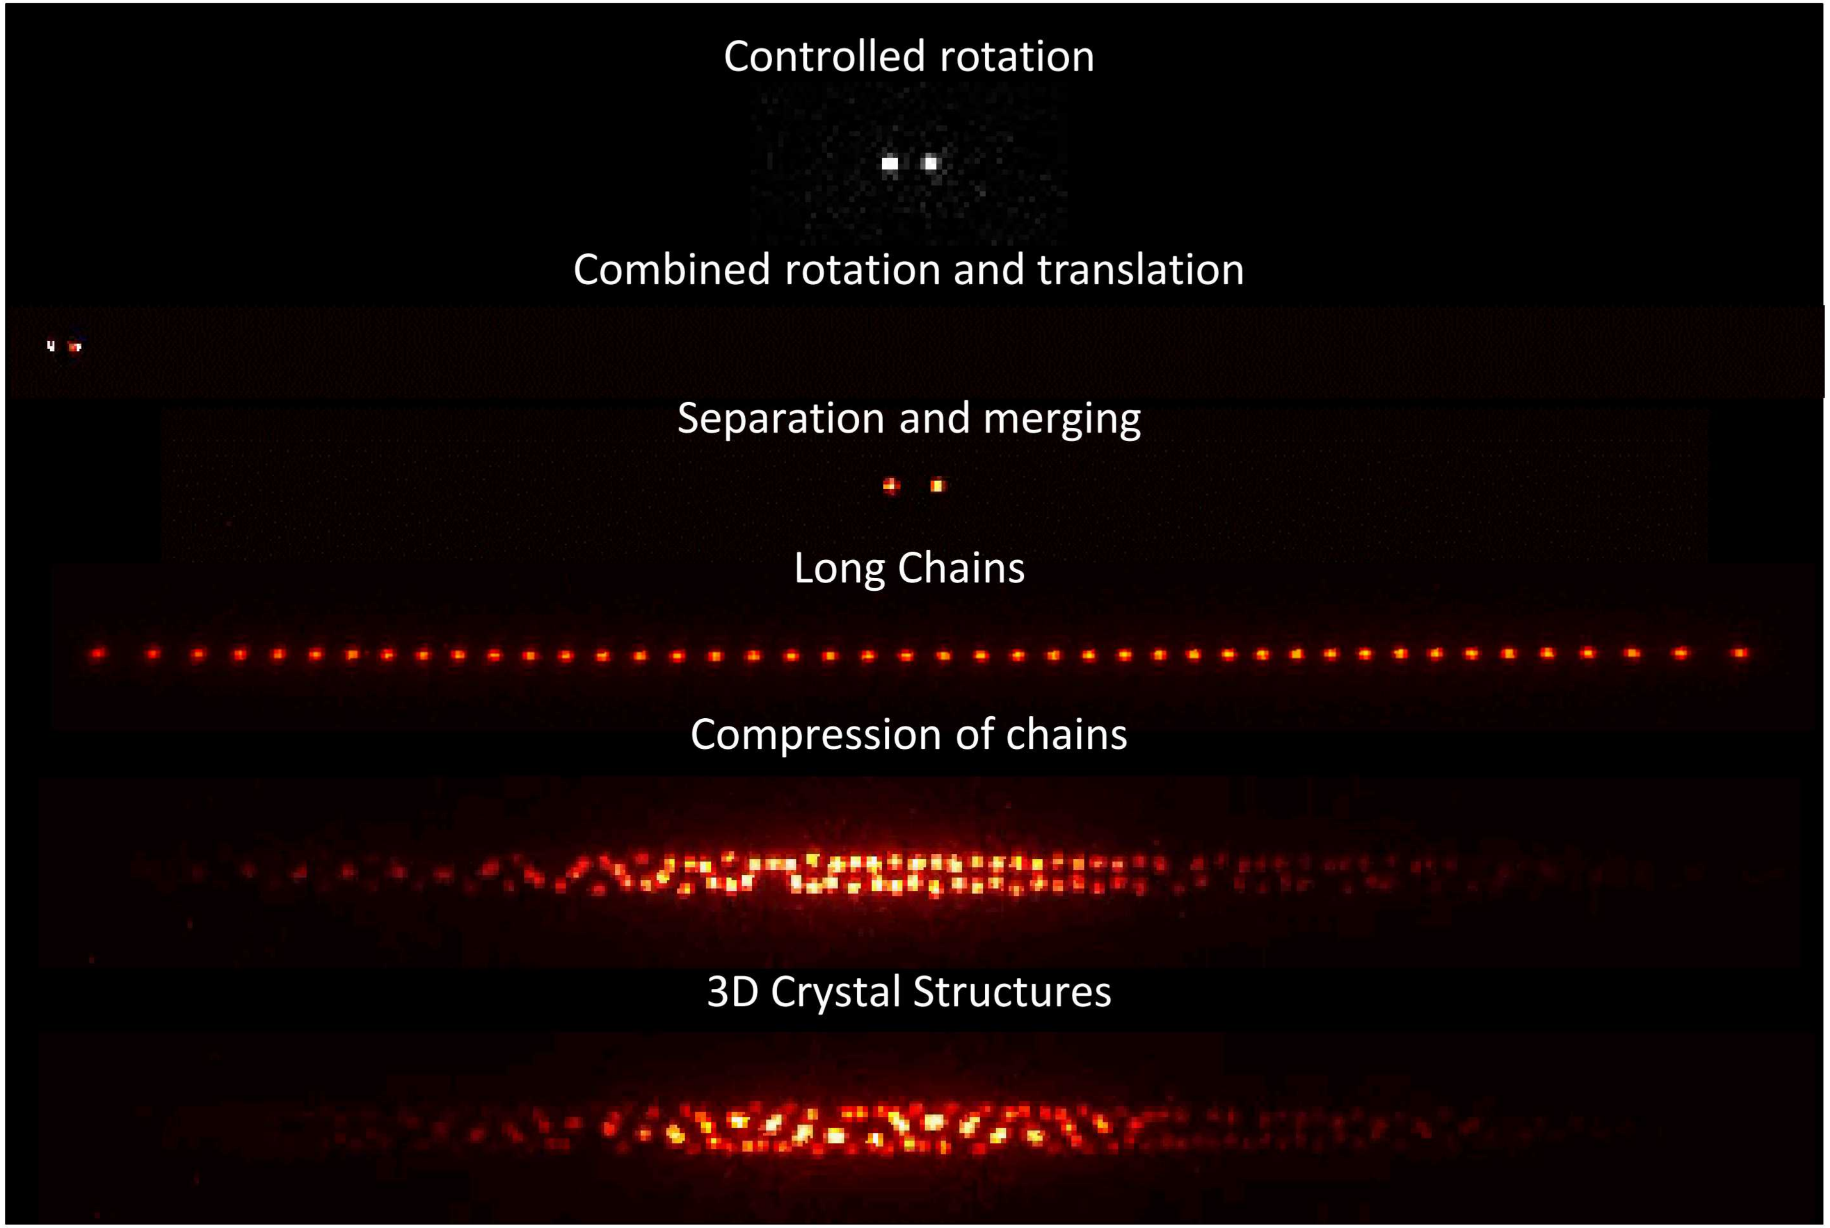
Microwave trap



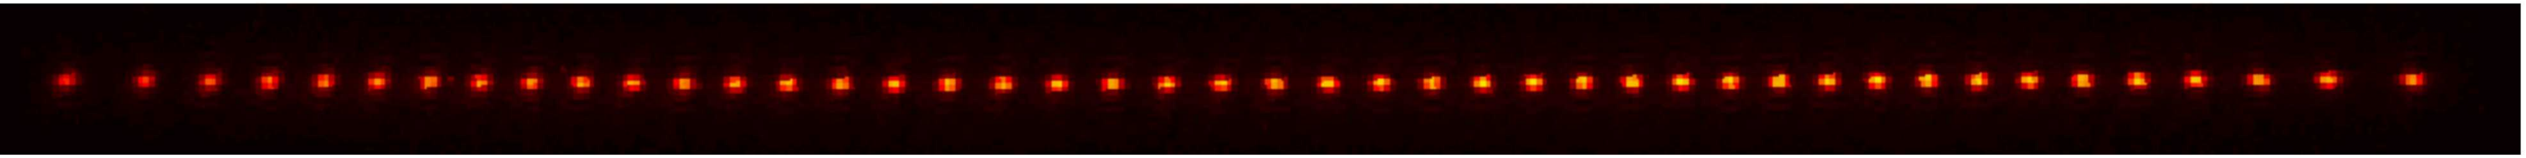
EPICS trap



Ion configurations



QSCOUT DOE Quantum Testbed Laboratory



Testbed systems designed for open access to support scientific applications

- High-fidelity operations
- Gate-level access
- Open system with fully specified operations and hardware
- Low-level access for optimal control down to gate pulses
- Open for comparison and characterization of gate pulses
- Open for vertical integration by users

$$\#gates \propto (\#qubits)^2$$

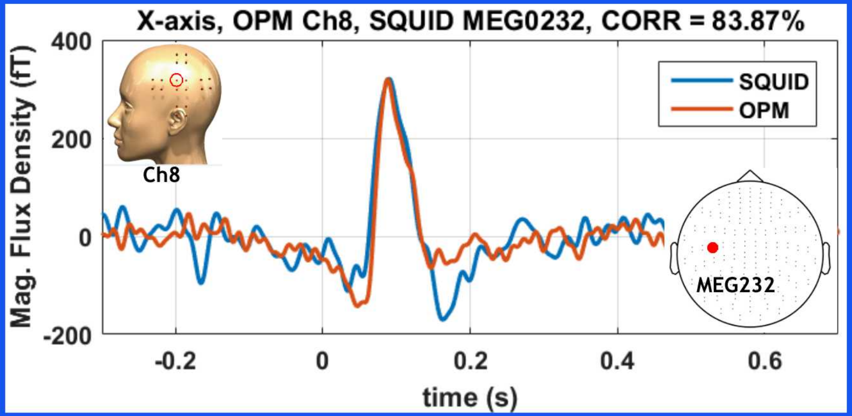
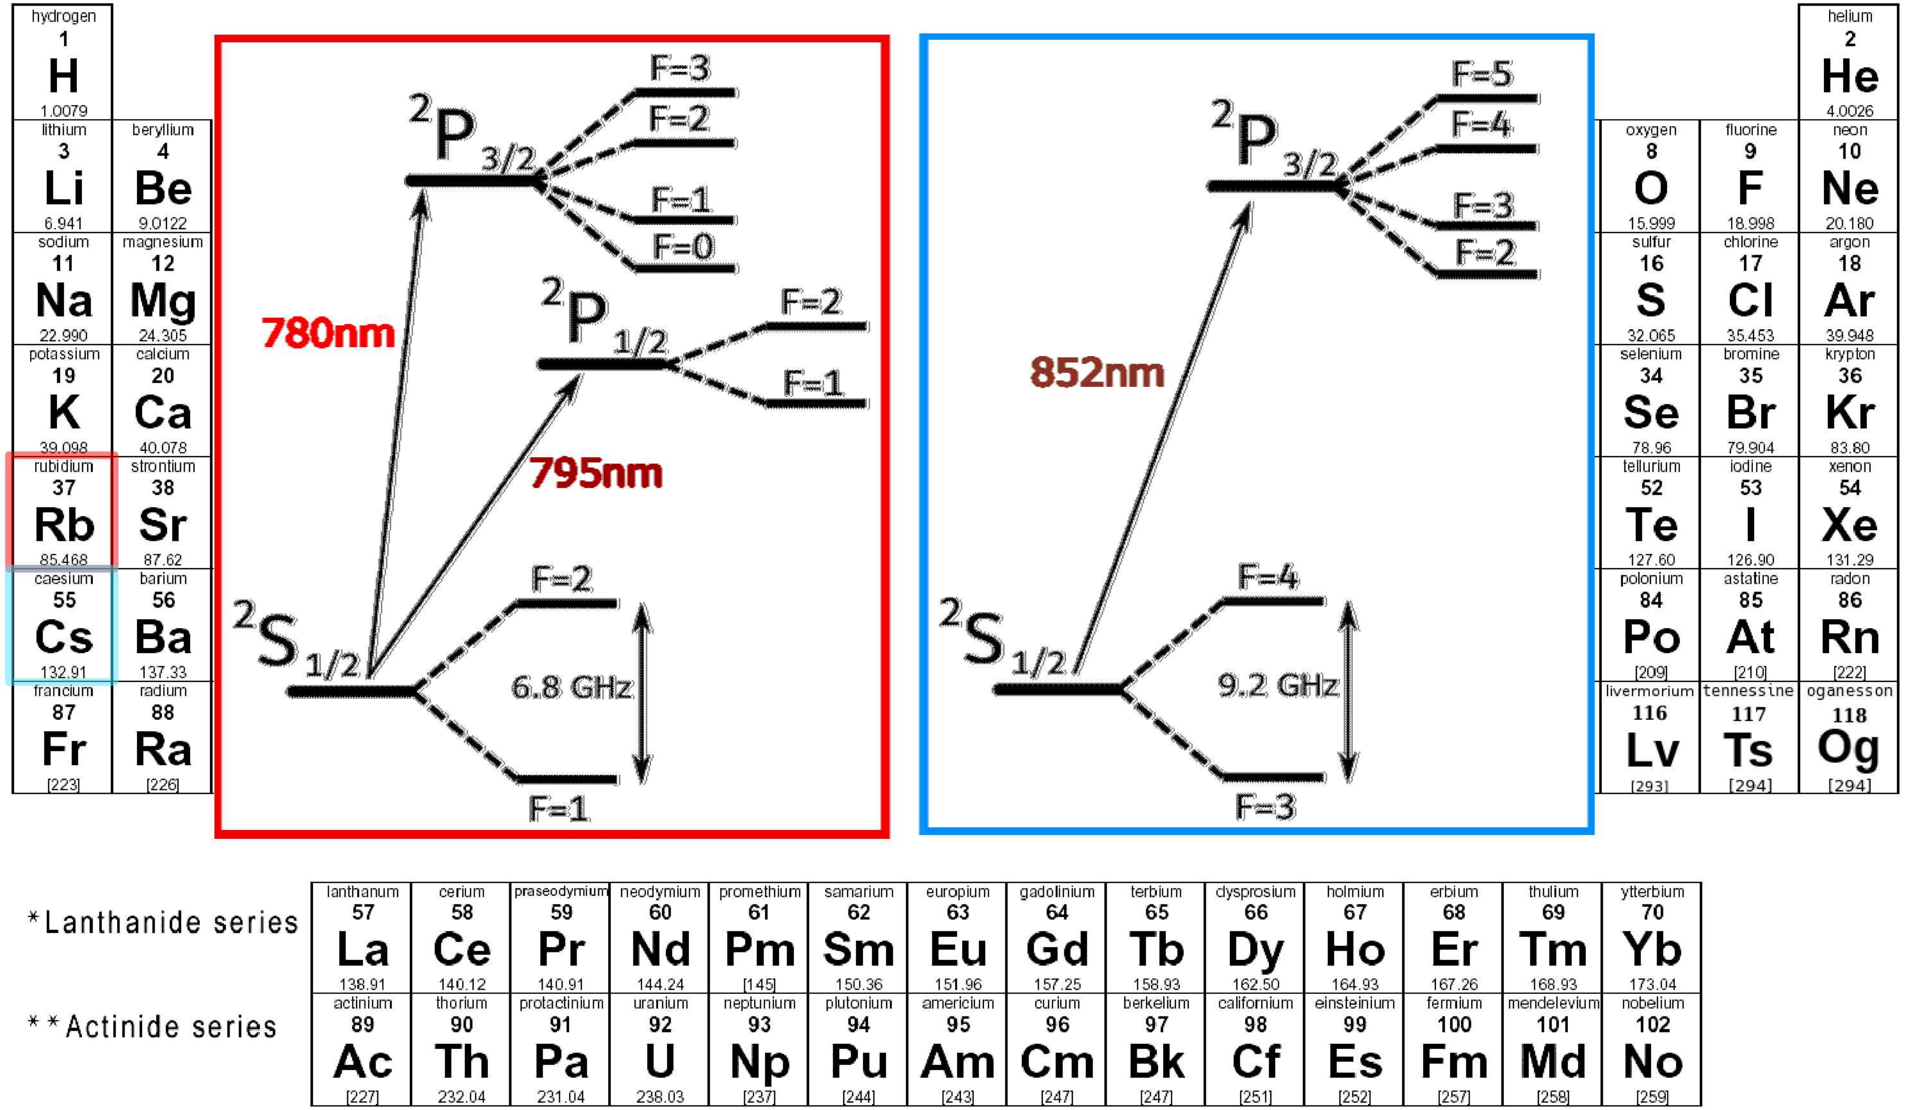
neutrals

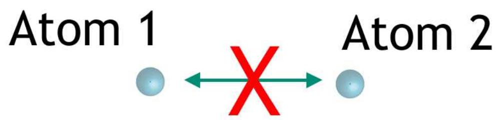
ΣΙΓΜΑ
Strategic Inertial Guidance with MAtterwaves



Two neutral atoms: ^{87}Rb and ^{133}Cs

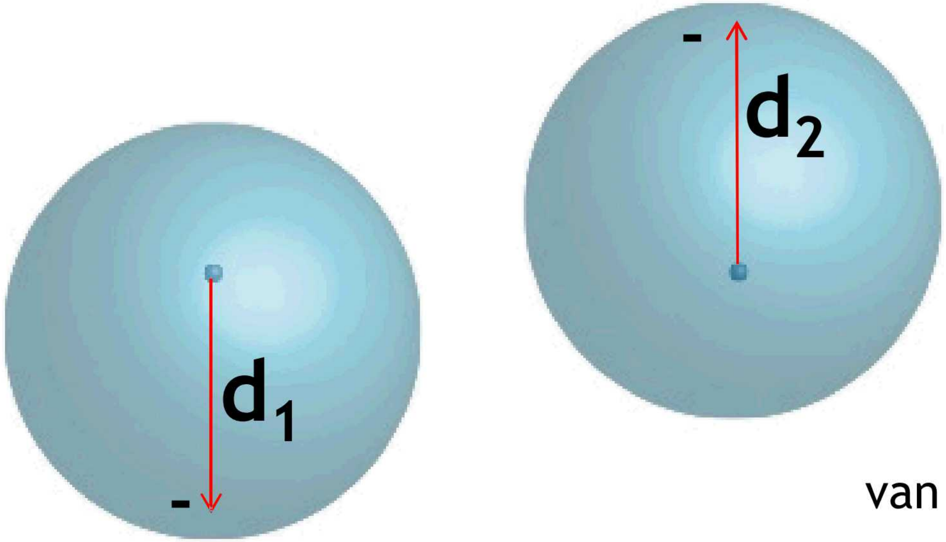


Making neutrals interact



- Interaction between ground state atoms is small ~100 Hz

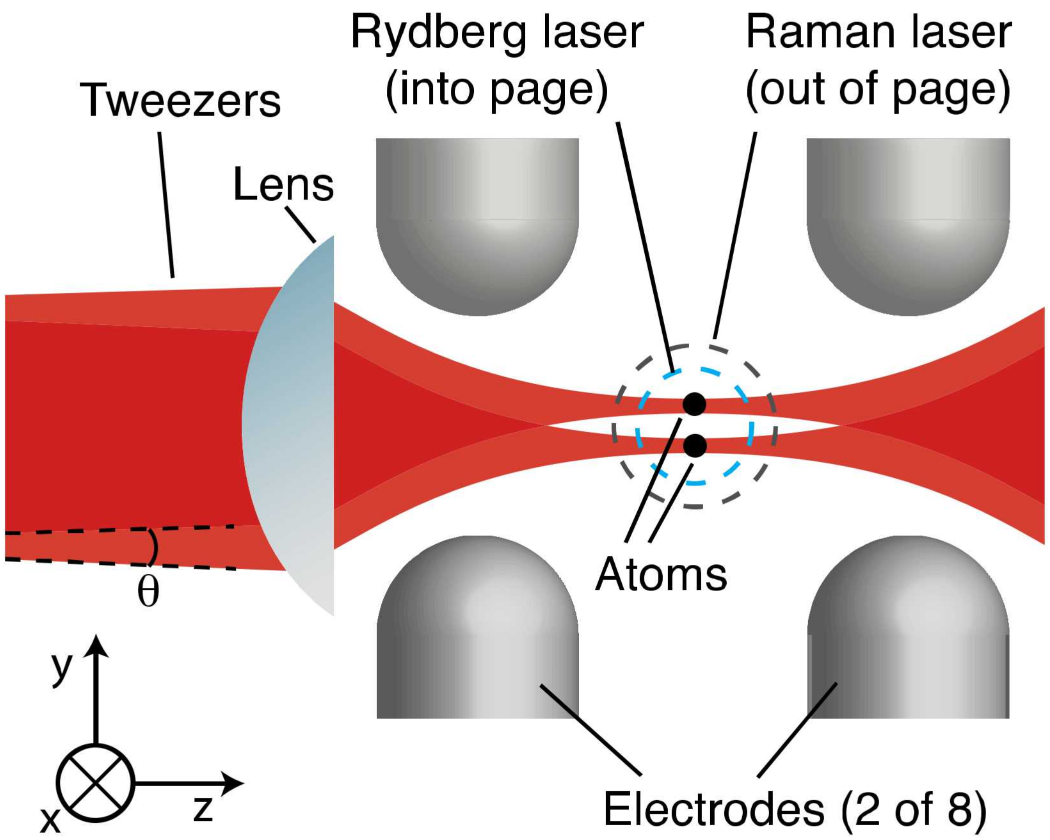
One solution: use Rydberg states

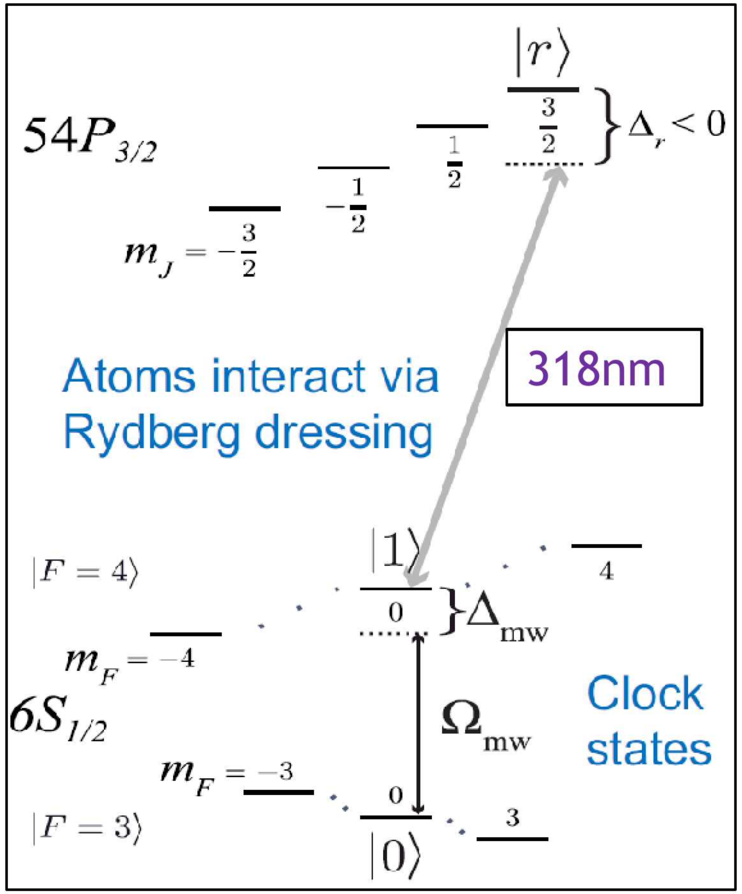


van der Waals interaction

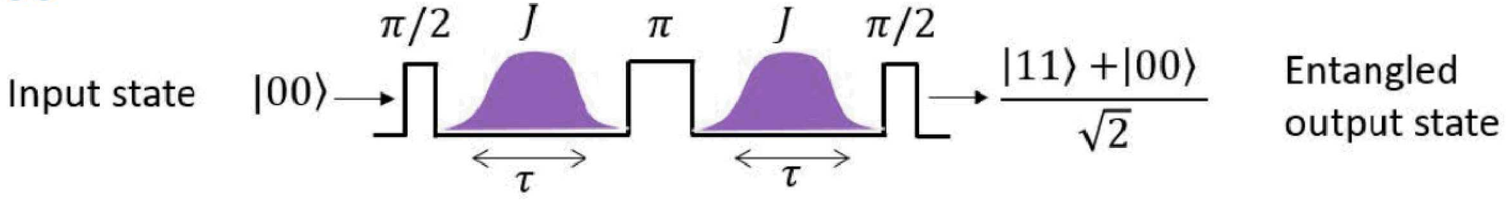
- Even the presence of another atom can cause a massive response >> 10 MHz
- Induced Electric Dipole-Dipole Interaction

Entangling neutrals





Pulse sequence



Atom interferometers and SIGMA

Atom interferometry applications

- Most accurate measurement of the fine structure constant, $\alpha=1/137.035999046(27)$
- Low frequency (0.1-10 Hz) gravitational-wave measurements

Inertial Navigation

- Matterwave interferometers respond to
  - Force (acceleration)
  - Rotation
  - Force gradients

SIGMA (Strategic Inertial Guidance with Matterwaves)

- high accuracy, real-time, non-aided navigation
- World's first truly portable, compact atom interferometer inertial sensor.

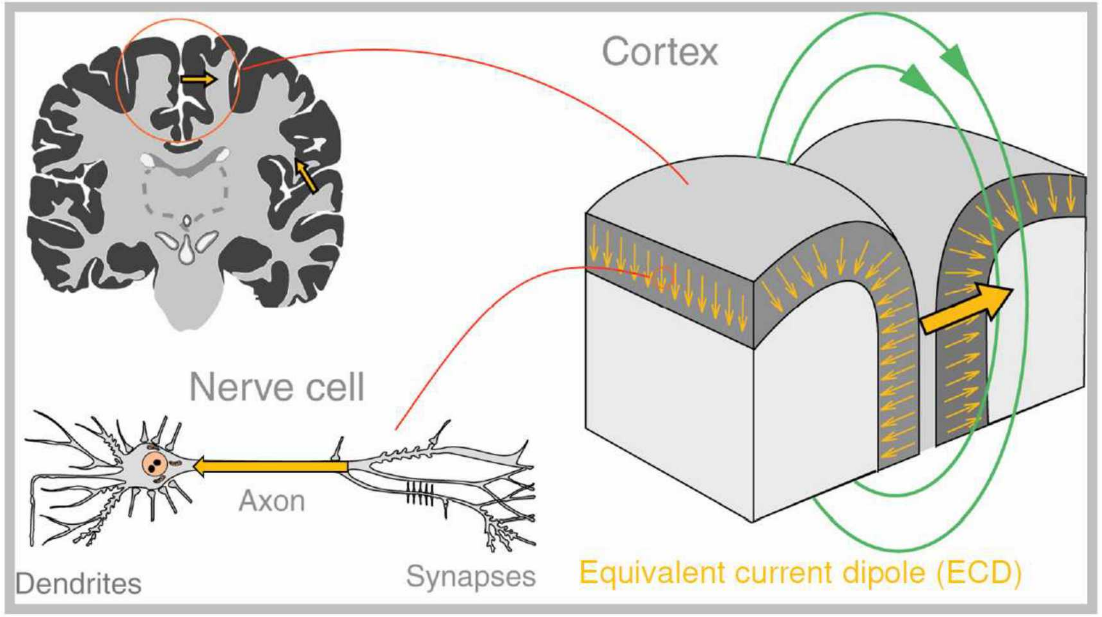
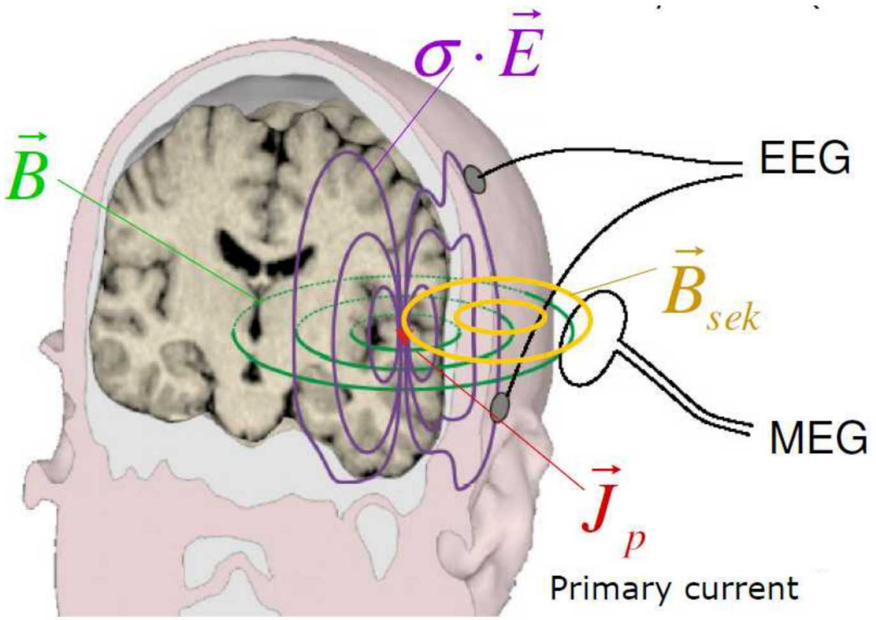
Magnetoencephalography using optically pumped magnetometers



B. Maess, MPI for Human Cognitive and Brain Sciences



Lauri Parkkonen (Aalto University)

- SQUID require dewar and a rigid helmet due to liquid He (~ 4 °k).
- SQUID's helmet manufactured to fit 95% adult male subject's head size.
- Large sensor-source distance diminishes the magnetic field and high frequency spatial components are affected more severely.
- Optically Pumped Magnetometers (OPMs) enable on-scalp Magnetoencephalography enhancing spatial resolution of magnetoencephalography.
- Applications:
  - Brain Computer Interface (BCI)
  - Clinical, e.g. epilepsy

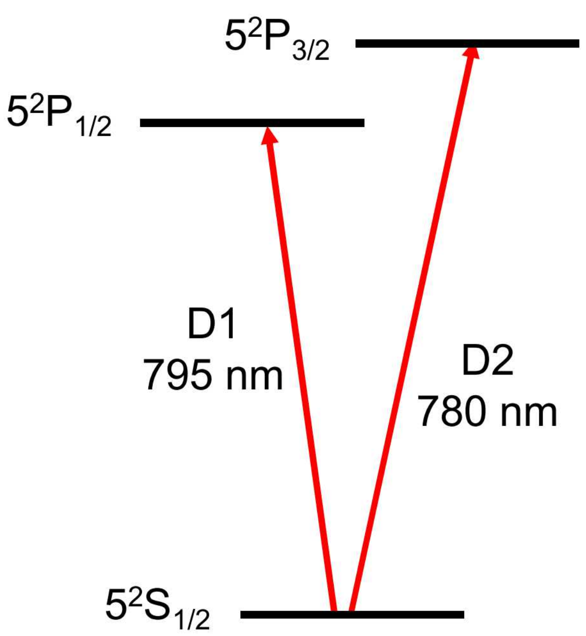
How the field is measured

Two optical resonances in Rubidium (fine structure)

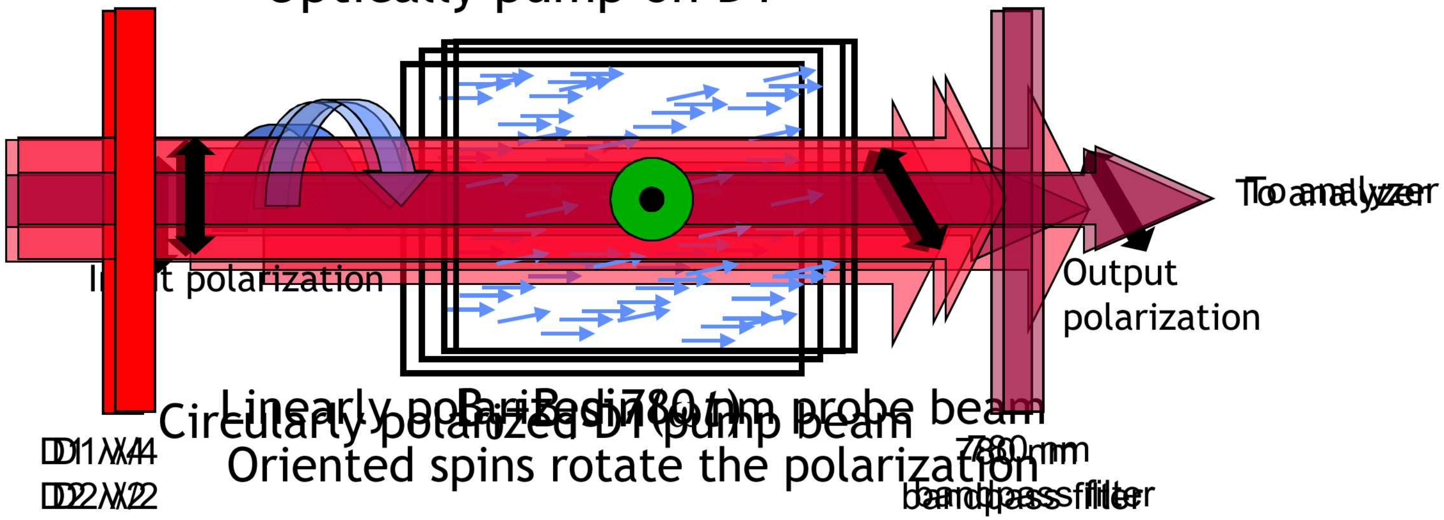
- Use D1 for optical pumping and D2 for probing

Based on: V. Shah and M. V. Romalis, PRA 80, 013416 (2009)

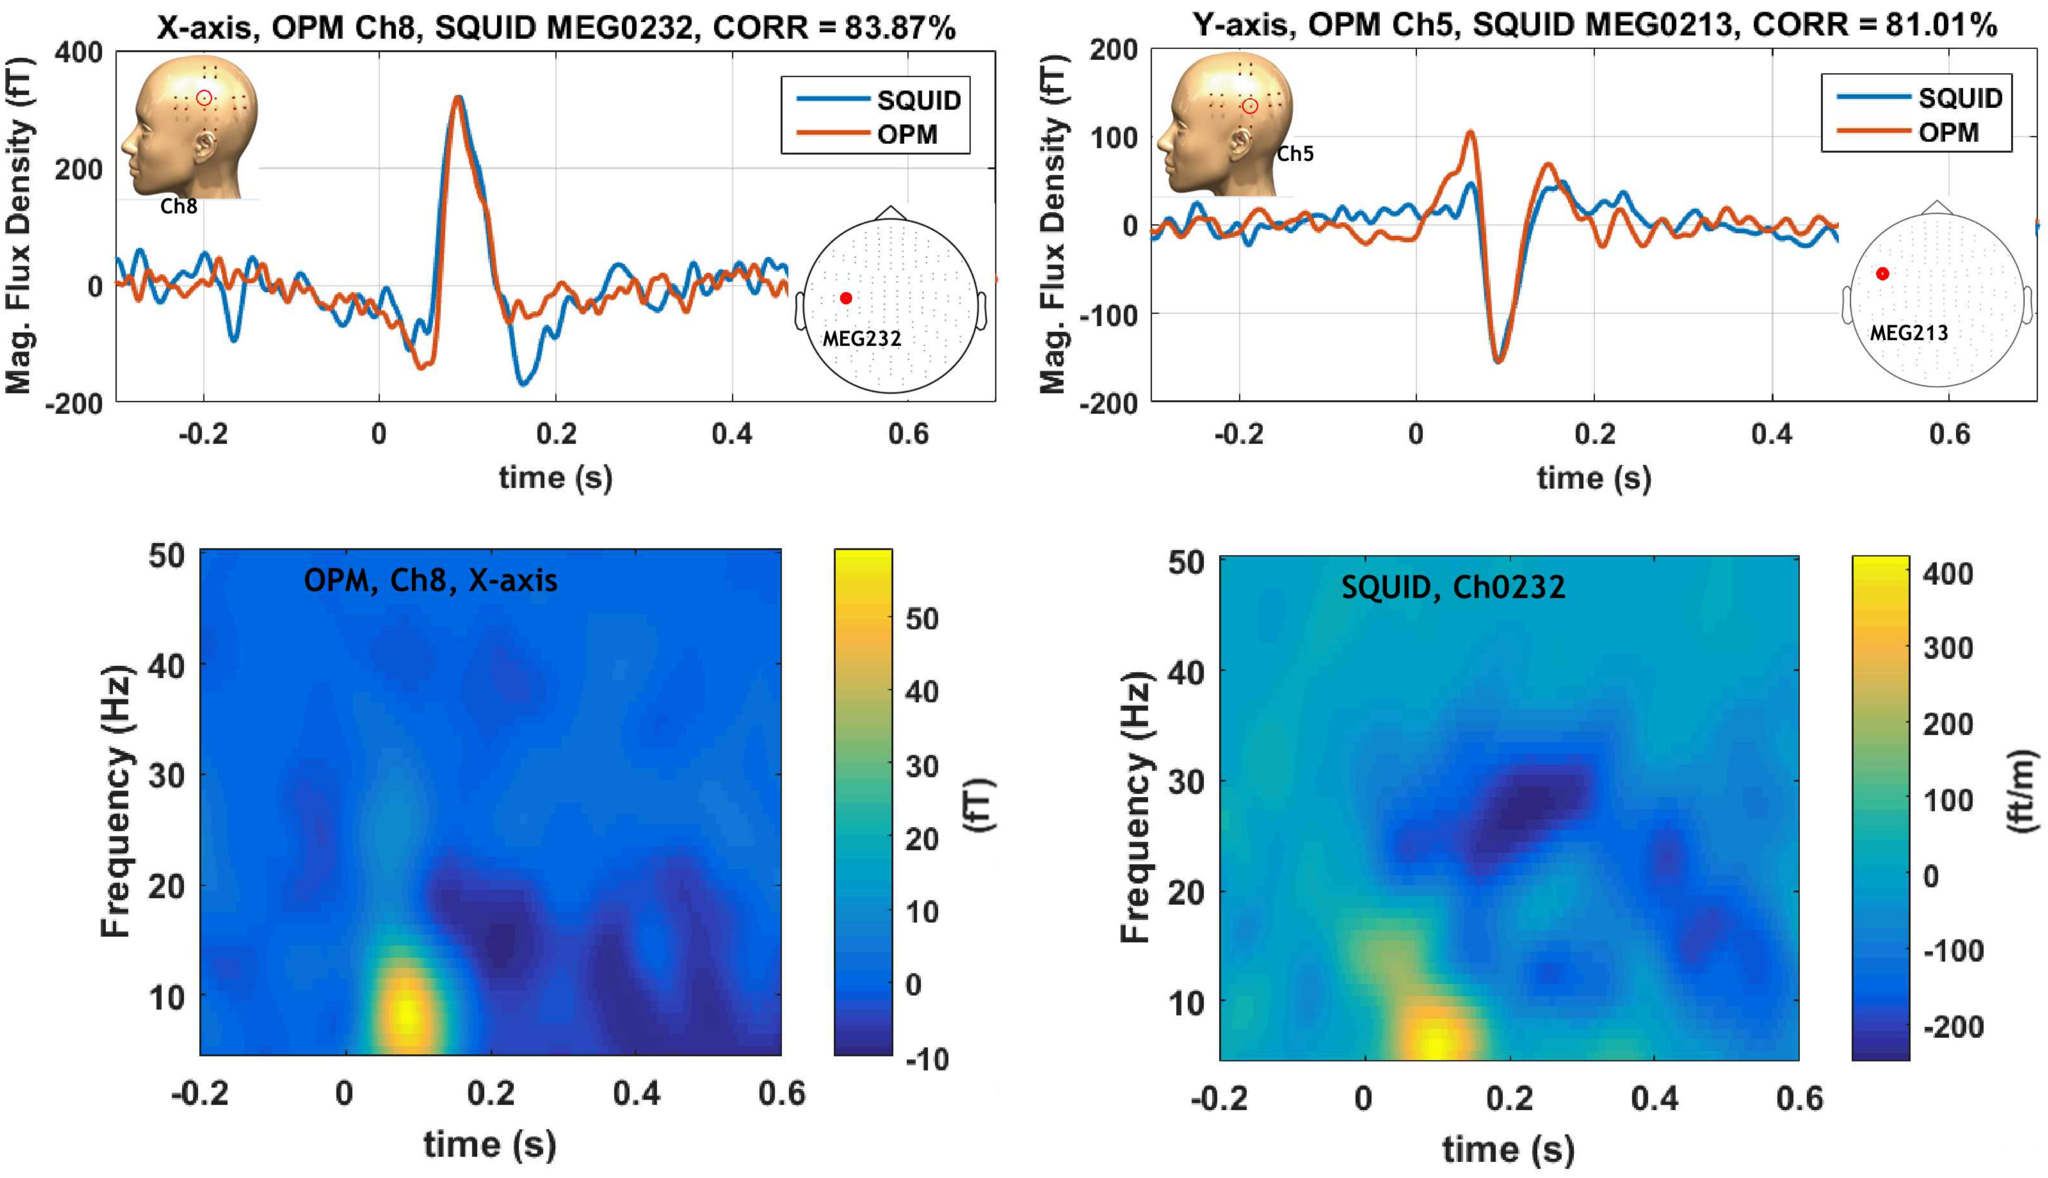
^{87}Rb Fine Structure



Field modulation/phase sensitive detection required to extract dispersive lineshape



Head-to-head SQUID vs. OPM



- More than 80% correlation for both x and y component

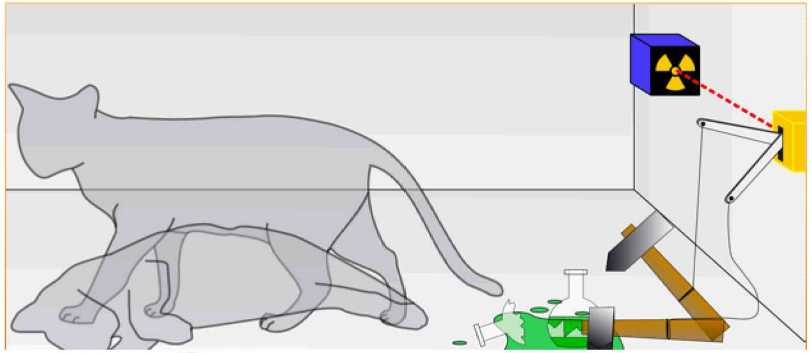
FY18-FY20
Atom Interferometer

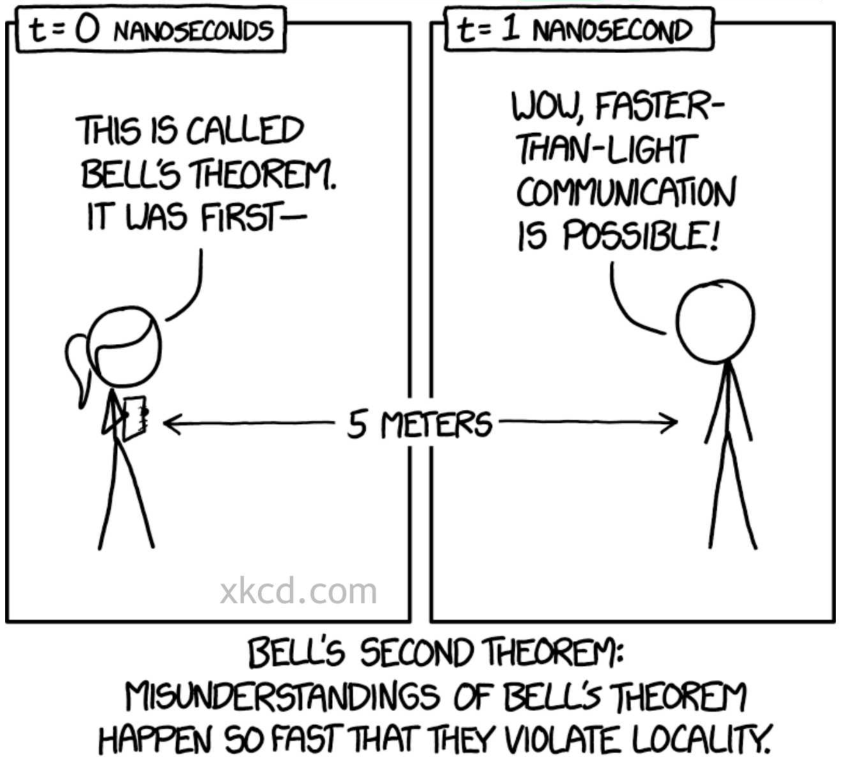
- Develop deployable quantum devices
- Quantum sensing based location determination

Quantum weirdness has real implications

- Quantum has some celebrated oddities that aren't intuitive:
  - Schrodinger's Cat is a thought experiment demonstrating quantum superpositions: that a particle could be in multiple states at once.
  - Bell's Theorem considers the implications of quantum entanglement.

- What is surprising is that superpositions and entanglement have important implications when you combine them with information theory.





Qubit comparison

	Superconducting loops	Trapped ions	Silicon quantum dots	Topological qubits	Diamond vacancies	Photons
	A resistance-free current oscillates back and forth around a circuit loop. An injected microwave signal excites the current into super-position states.	Electrically charged atoms, or ions, have quantum energies that depend on the location of electrons. Tuned lasers cool and trap the ions, and put them in superposition states.	These "artificial atoms" are made by adding an electron to a small piece of pure silicon. Microwaves control the electron's quantum state.	Quasiparticles can be seen in the behavior of electrons channeled through semi-conductor structures. Their braided paths can encode quantum information.	A nitrogen atom and a vacancy add an electron to a diamond lattice. Its quantum spin state, along with those of nearby carbon nuclei, can be controlled with light.	Single photons are most commonly entangled through polarization or path variables. Principally controller with waveguides, mirrors, and beamsplitters.
Longevity (seconds)	0.00005	>1000	0.03	N/A	10	<0.001
Logic success rate	~~99.4%~~ 99.5%	~~99.9%~~ >99.9 %	~99%	N/A	99.2%	~98%
Number entangled	High*	High	Low	N/A	Low	Medium
Company support	Google, IBM, Quantum Circuits	ionQ	Intel	Microsoft, Bell Labs	Quantum Diamond Technologies	PsiQ
Pros	Solid state Fast working. Build on existing semiconductor industry.	can room temp/connects Very stable. Highest achieved gate fidelities.	Very fast, solid state Stable. Build on existing semiconductor industry.	Greatly reduce errors.	Can operate at room temperature.	Room temperature, manufacturable
Cons	Collapse easily and must be kept cold.	Slow operation. Many lasers are needed.	Only a few entangled. Must be kept cold.	Existence not yet confirmed.	Difficult to entangle.	Generation/extraction, lifetimes, fidelity

Note: Longevity is the record coherence time for a single qubit superposition state, logic success rate is the highest reported gate fidelity for logic operations on two qubits, and number entangled is the maximum number of qubits entangled and capable of performing two-qubit operations.

Google's random circuit in more detail

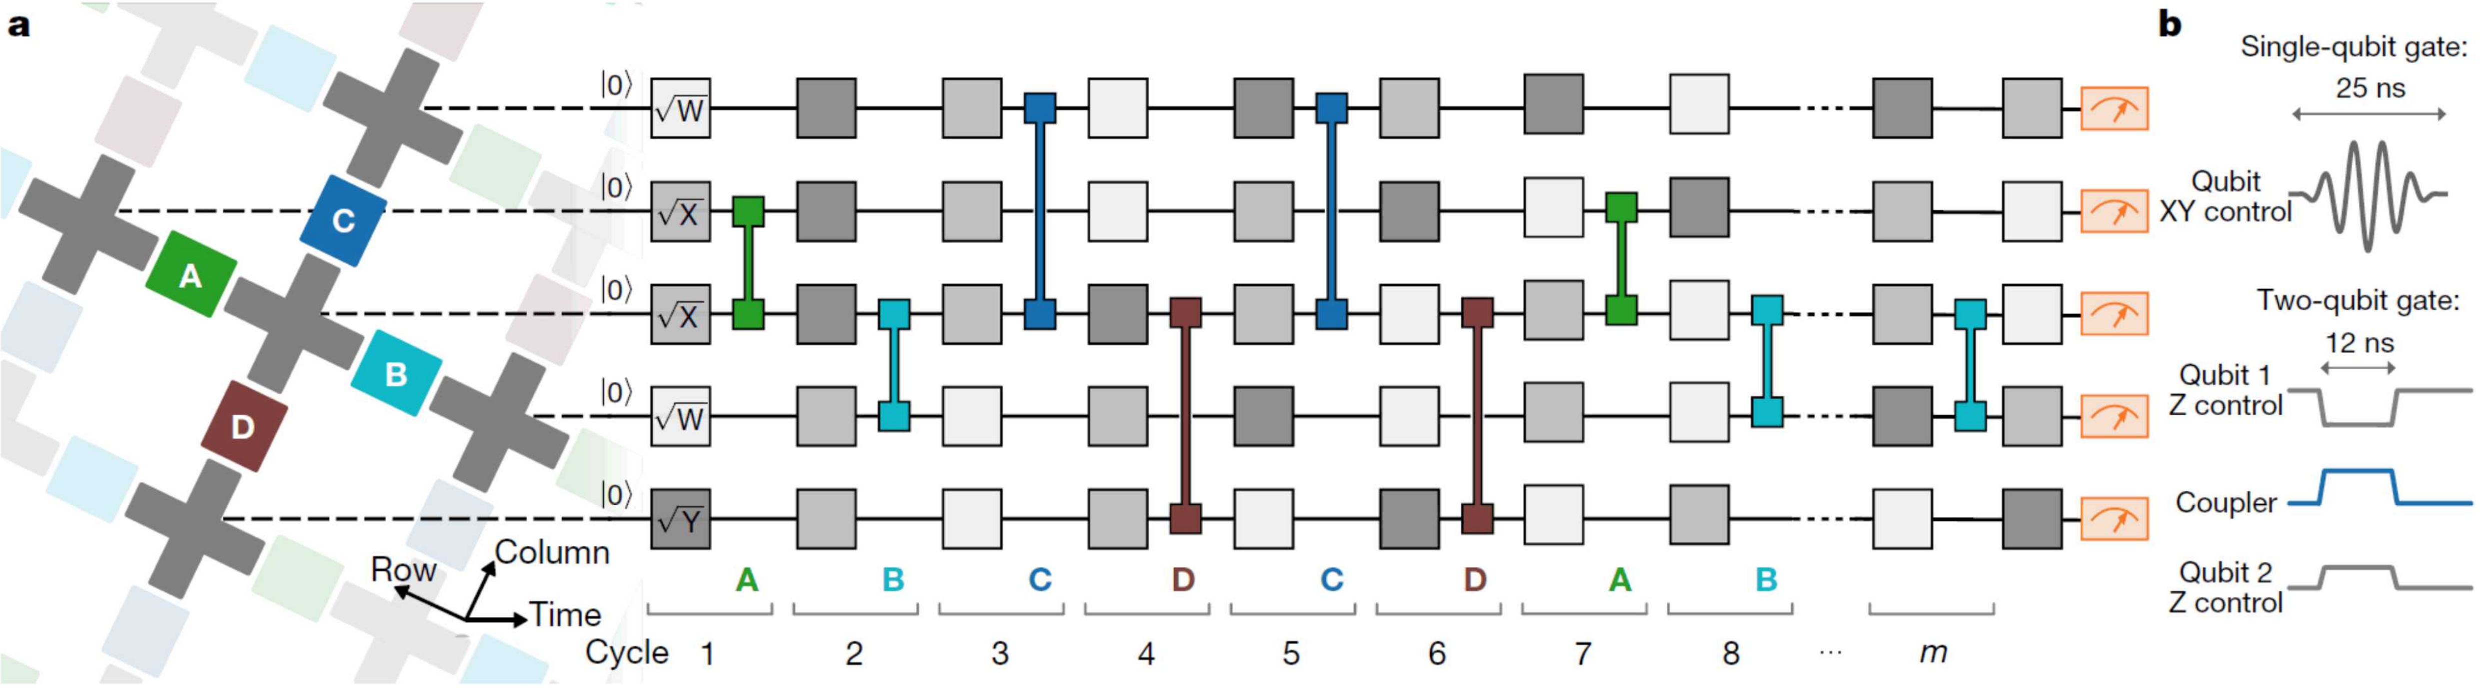

Fig. 3 | Control operations for the quantum supremacy circuits. a, Example quantum circuit instance used in our experiment. Every cycle includes a layer each of single- and two-qubit gates. The single-qubit gates are chosen randomly from $\{\sqrt{X}, \sqrt{Y}, \sqrt{W}\}$, where $W = (X + Y)/\sqrt{2}$ and gates do not repeat sequentially. The sequence of two-qubit gates is chosen according to a tiling pattern, coupling each qubit sequentially to its four nearest-neighbour qubits. The couplers are divided into four subsets (ABCD), each of which is executed simultaneously across the entire array corresponding to shaded colours. Here we show an intractable sequence (repeat ABCDCDAB); we also use different coupler subsets along with a simplifiable sequence (repeat EFGHEFGH, not shown) that can be simulated on a classical computer. **b**, Waveform of control signals for single- and two-qubit gates.

Signals to detect

Spin Polarization Bloch Equation

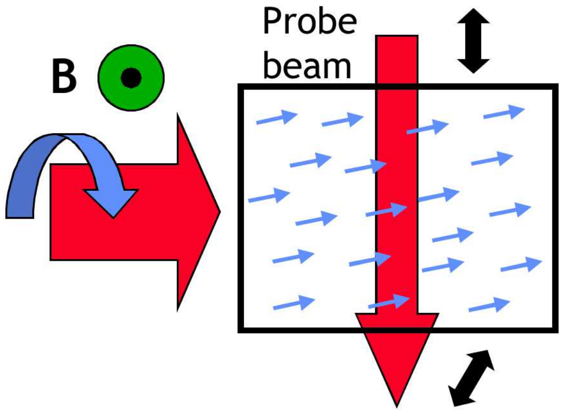
$$\frac{d\mathbf{S}}{dt} = \gamma \mathbf{S} \times \mathbf{B} + R(S_0\hat{z} - \mathbf{S}) - \frac{\mathbf{S}}{T_2}$$

Steady State Solution

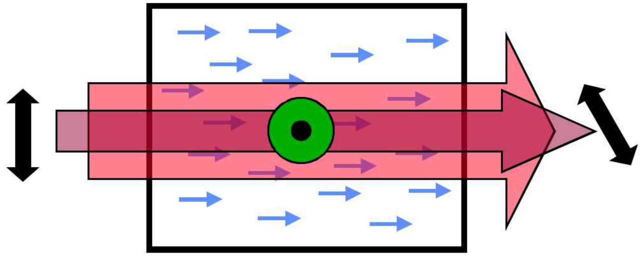
$$S_x = S_0 \frac{-\beta_y + \beta_x \beta_z}{1 + (\beta_x^2 + \beta_y^2 + \beta_z^2)} \qquad S_z = S_0 \frac{1 + \beta_z^2}{1 + (\beta_x^2 + \beta_y^2 + \beta_z^2)}$$

$$\boldsymbol{\beta} = \gamma \mathbf{B}/(R + T_2^{-1})$$

Transverse Pump

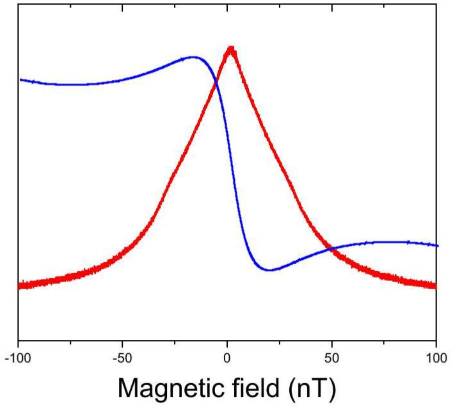


Detect the Pump
or a Collinear Probe



$B_0 + B_1 \sin(\omega t)$

Atomic Polarization, S_z
Pump Transmission,
or Angle of Light Polarization



Atomic Polarization, S_x
or Angle of Light Polarization

QSCOUT details

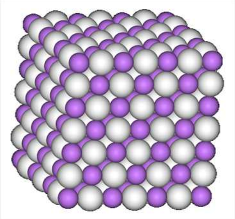
DOE/SC Advanced Scientific Computing Research (ASCR) **QSCOUT** (PI: P. Maunz)

- Quantum processor with **5-15 trapped-ion qubits**
- Goal: **Available to the DOE/SC computing community** in 2020
  - Access to quantum processor with high-fidelity operations
  - Low-level access to gate & quantum circuit implementations
  - Full information on implementation of quantum operations
  - Ability to run any testing circuits

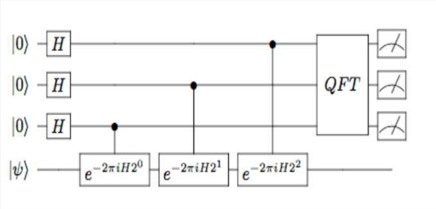
Design approach

- Build on established qubits ($^{171}Yb^{+}$)
- Use Sandia microfabricated traps
- Use established qubit manipulation tools (e.g. pulsed laser as demonstrated at UMD, Duke, Sandia)

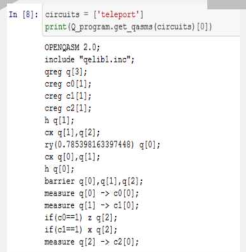
Example QSCOUT workflow:



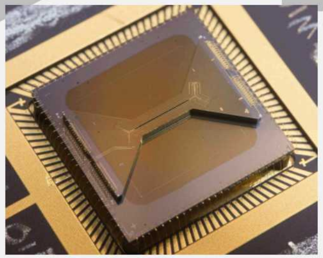
Lithium hydride example



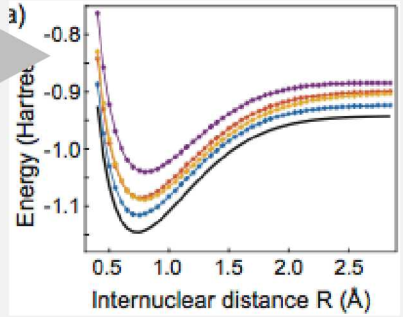
Textbook digital quantum simulation circuit



QSCOUT code/ microcode



Implement on hard-ware/trapped ions



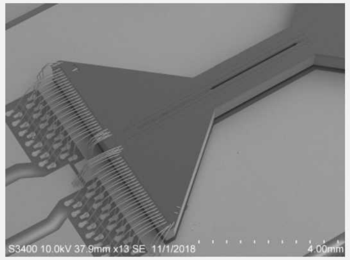
Results

QSCOUT's **main interdisciplinary tasks**

Qubit hardware	Gate modeling	QCVV
Hardware controllers	Software stack	Exemplar apps

QSCOUT **collaborations**

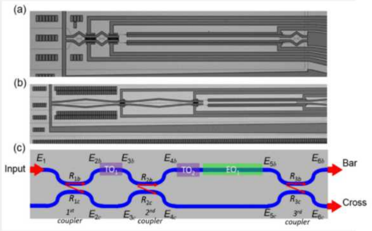
- Duke University (K. Brown)
- Tufts University (P. Love)
- LBNL
- Open to others…

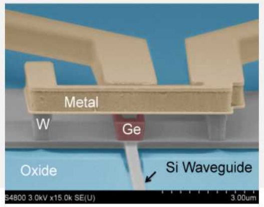


The National Security Photonics Center

Integrated photonics for quantum communications

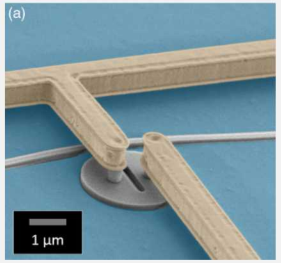
Sandia's silicon, III-V, alumina, lithium niobate heterogeneously integrated photonic platforms: compact microsystems for telecom and visible wavelengths

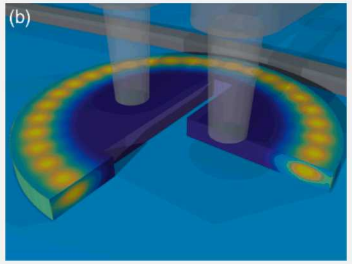




Cryogenic optical interconnects

High-speed low-power resonant modulator operating at cryogenic temperatures (≤ 4 K)

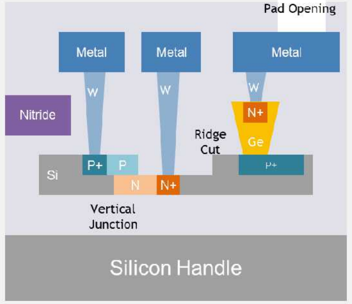




Optica **4,** 374-382 (2017)

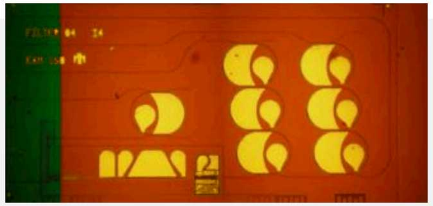
Silicon photonics integrated circuits

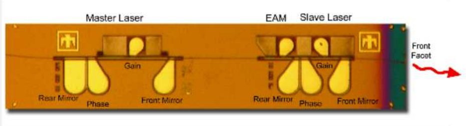
- Leverage CMOS (200 mm SOI)
- 22 passive devices, 20 active devices, design guide and library
- **MPW runs available**, up to passive+active+Ge devices



III-V photonic integrated circuits (PICs)

- InP, GaAs, GaN
- Elements: Waveguides, lasers, amplifiers, modulators, detectors, phase shifters
- **MPW runs available**





More information on photonics MPW opportunities:

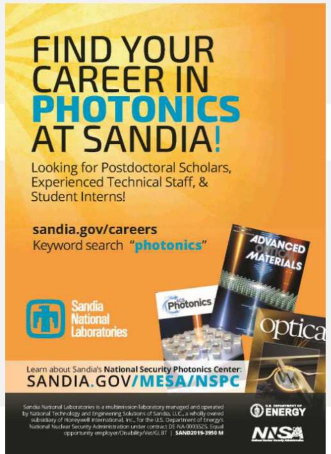
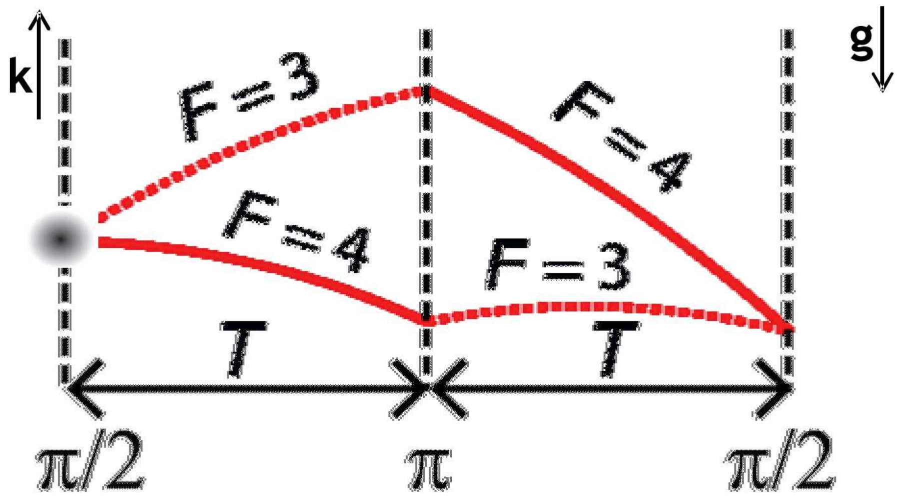
- Contact photonics@sandia.gov



Under gravity

wavepacket trajectory



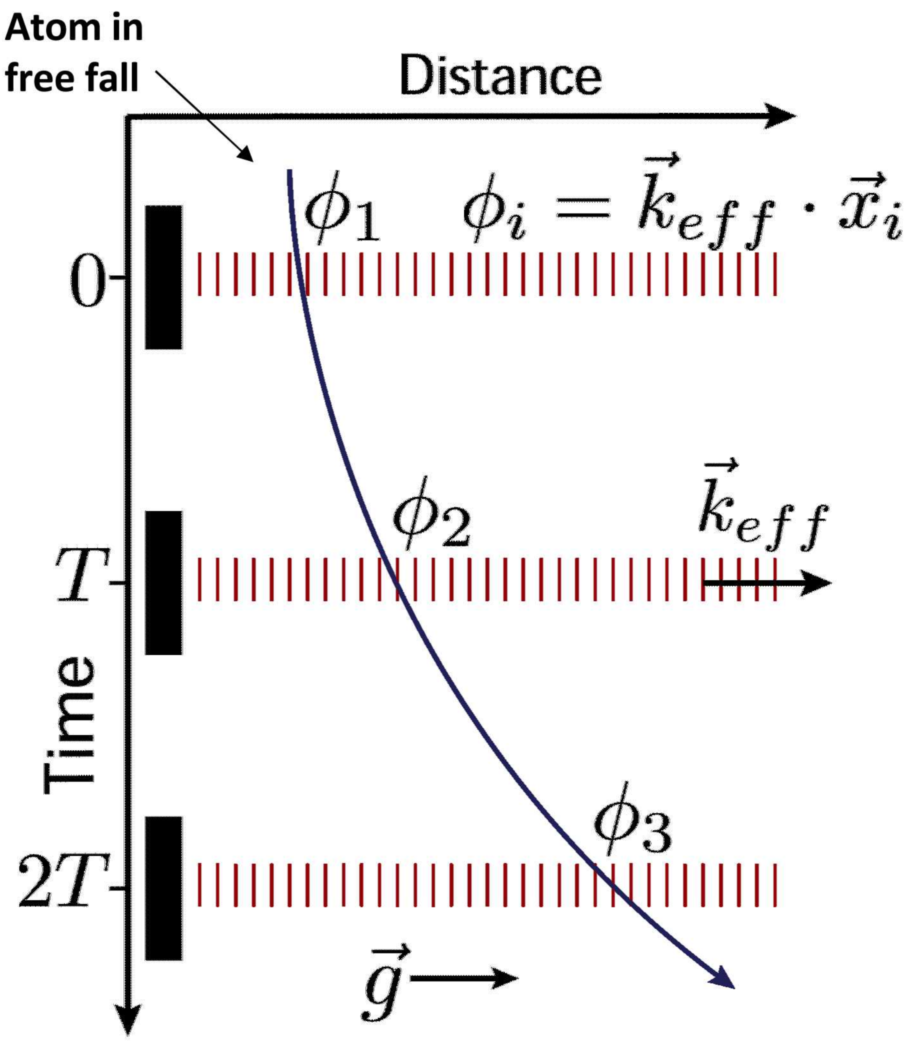
$$\Delta\phi_{tot} = \Delta\phi_{light} + \Delta\phi_{path} + \Delta\phi_{separation}$$

Light interaction imprints phase

Feynman path integral

Wavepacket overlap

Laser/atom system as ruler



"Laser ranging"

$$\vec{k}_{eff} \approx 1.6 \times 10^7 \mathrm{rad/m}$$

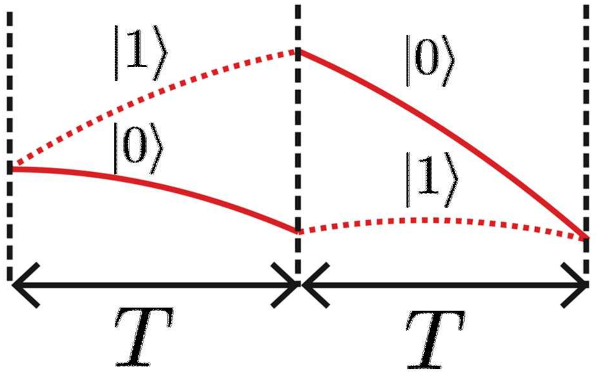
Finite difference formula for curvature

$$\Delta\phi = \phi_1 - 2\phi_2 + \phi_3$$

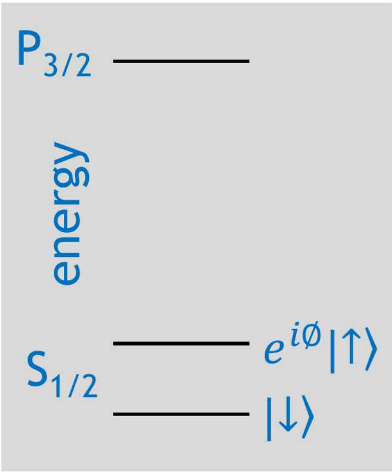
$$\Delta\phi = \vec{k}_{eff} \cdot \vec{g}\, T^2$$

$$P_{|1\rangle} = \frac{1}{2}(1 - \cos(\Delta\phi + \phi_0))$$

Why is it an interferometer?

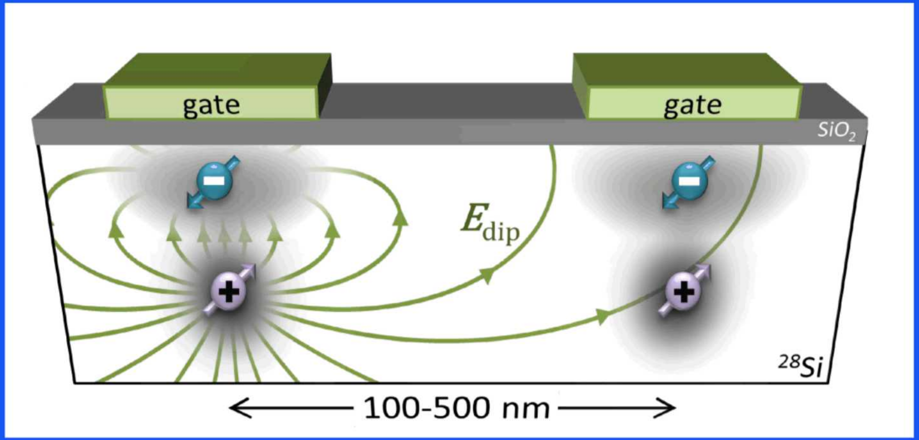


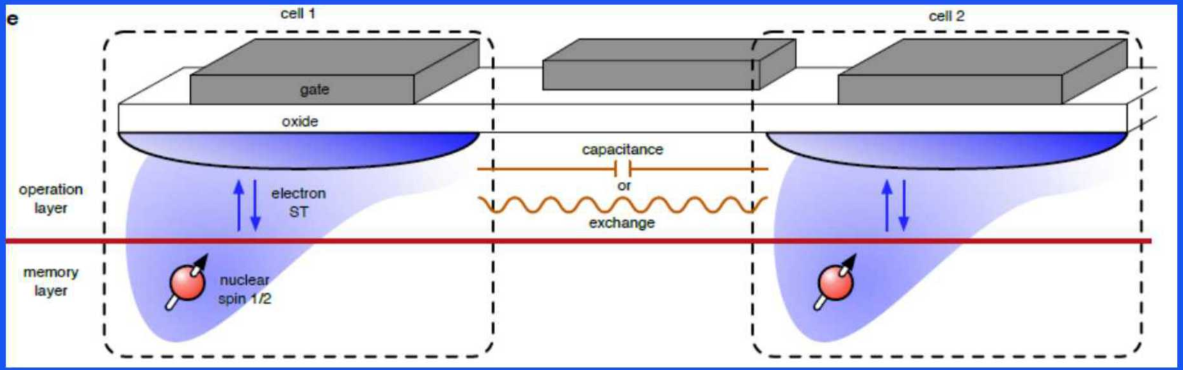
Single atom trajectory



Kasevich, and Chu, Phys. Rev. Lett. 67, 181–184 (1991)

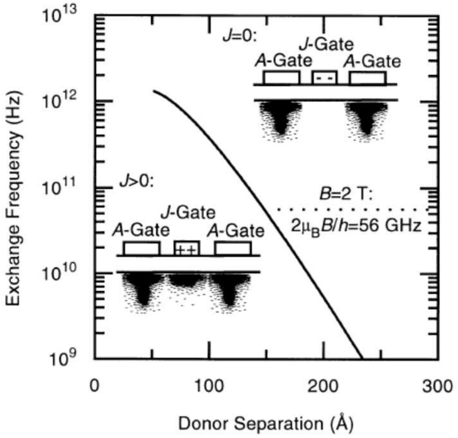
Semiconductors





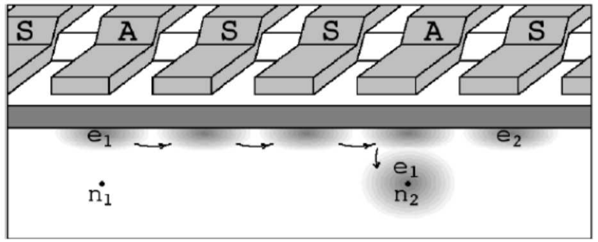
Donor architectures

Exchange btwn QDs



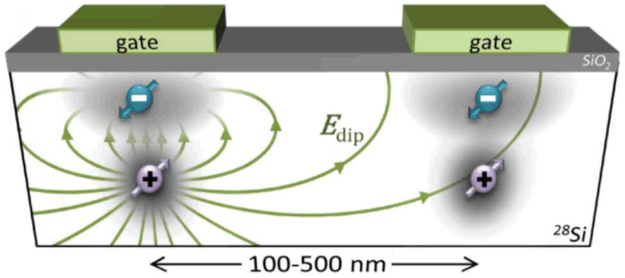
Kane (1998), Vrijen (2000)

Transport along QDs



Skinner & Kane (2003), Hollenberg (2007), Morton (2009), Witzel (2015), Pica (2015)

Dipole coupling



Tosi (2015), Hill (2015)

- Many donor qubit proposals driven by:
  - Nuclear & electron spin decoherence times and fidelities
  - On/off control of a naturally provided bulk potential
  - Temperature robustness
- Grand challenge: engineering deterministic coupling
  - Specialized fab using hydrogen lithography & STM
  - Counted implant
  - Success also achieved with timed implant

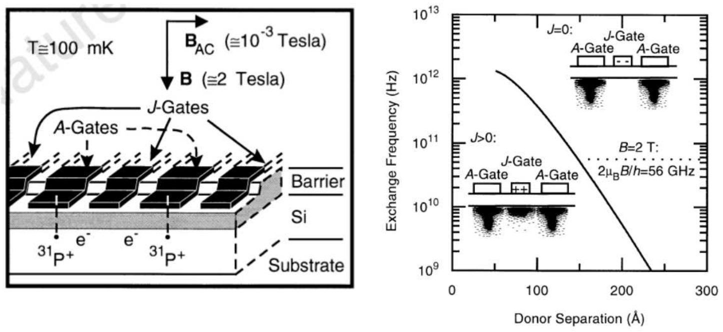
Ionized nuclear spin
CQC2T, Nat. Nano. 2014:
$T_2^* = 600$ ms
$T_{2,\ CPMG} = 36.5$ s
$F_{prep/readout} = 99.995\%$

J. Phys.: Cond. Matter (2015):
Random benchmarking
$F_{gate} = 99.95\text{-}99.99\%$

Donor qubits

- Donor nuclear spin qubits have exceptional fidelities
- Fabricating and controlling single atoms is hard
- Many proposals access donors through surface QDs
- This talk: first coherent coupling of MOS QD with donor qubit

Donor qubit architecture



Kane, Nature, 1998.

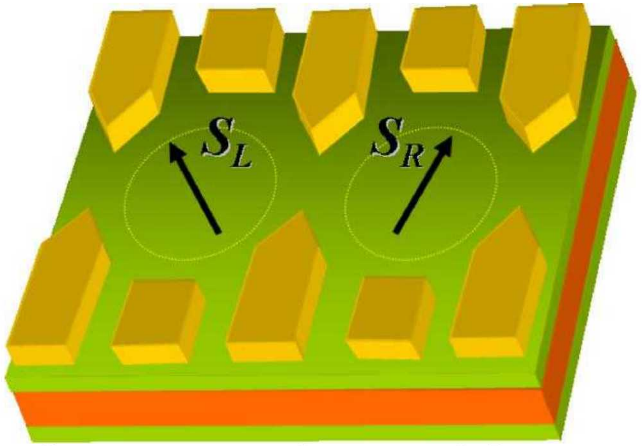
Ionized nuclear spin
CQC2T, Nat. Nano. 2014:
T_2^* = 600 ms
$T_{2,\ CPMG}$ = 36.5 s
$F_{prep/readout}$ = 99.995%

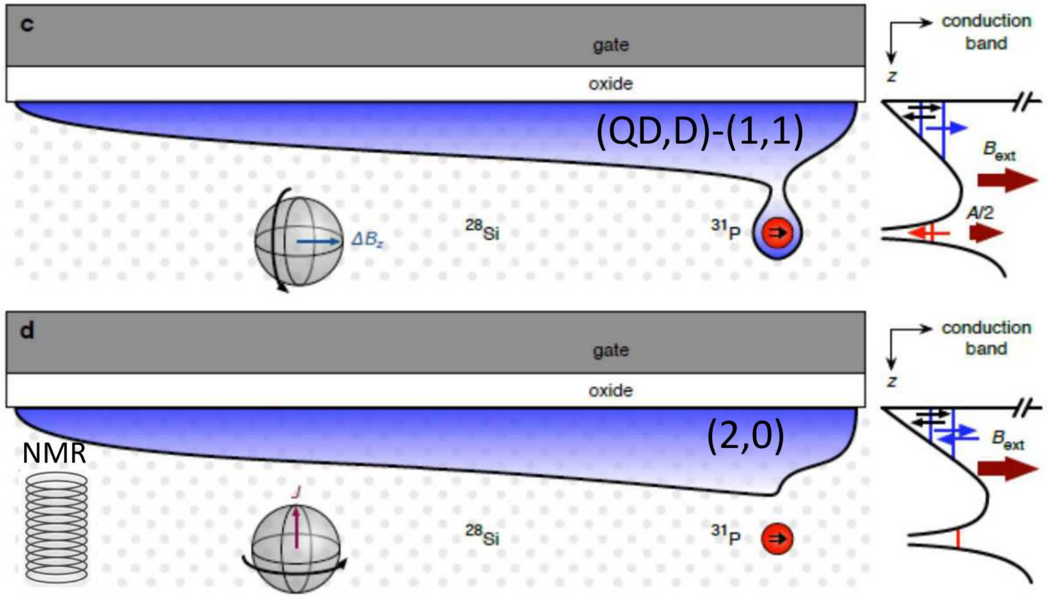
J. Phys.: Cond. Matter (2015):
Random benchmarking
F_{gate} = 99.95-99.99%



Quantum dot architecture

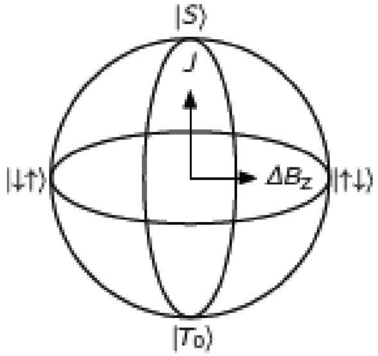
D. **Loss** and D. P. **DiVincenzo** Phys. Rev. A, 1998.

Notional approach



Hamiltonian

$$\hat{H}_{ST} = J(\epsilon)\hat{\sigma}_Z + \Delta B_Z(\epsilon)\hat{\sigma}_X$$



$AI \cdot S$

This is also a phase gate on the nuclear spin → $AI \cdot S$

- Treat problem as hybridization of QD and donor qubits
- Voltage tune to resonance – nudge QD to one of many donors
- Encode as two electron singlet-triplet electron qubit
  - Nuclear spin qubit: spectator or 2nd qubit with hyperfine coupling
- Gradient field is supplied by nuclear spin of donor
  - 58 MHz (P) to greater than GHz (Sb or Te) might be possible
- Electrical control through voltage tuned exchange energy
- NMR to drive nuclear spin & several electrical readouts possible
