

*Presented at the 2021 TechConnect World Innovation Conference & Expo,  
October 18 – 20, 2021*

# Long-Duration High-Temperature Thermal Energy Storage for Grid and Industrial Applications

PRESENTED BY

Clifford K. Ho, Ph.D., [ckho@sandia.gov](mailto:ckho@sandia.gov)

Sandia National Laboratories

SAND2021-XXXX

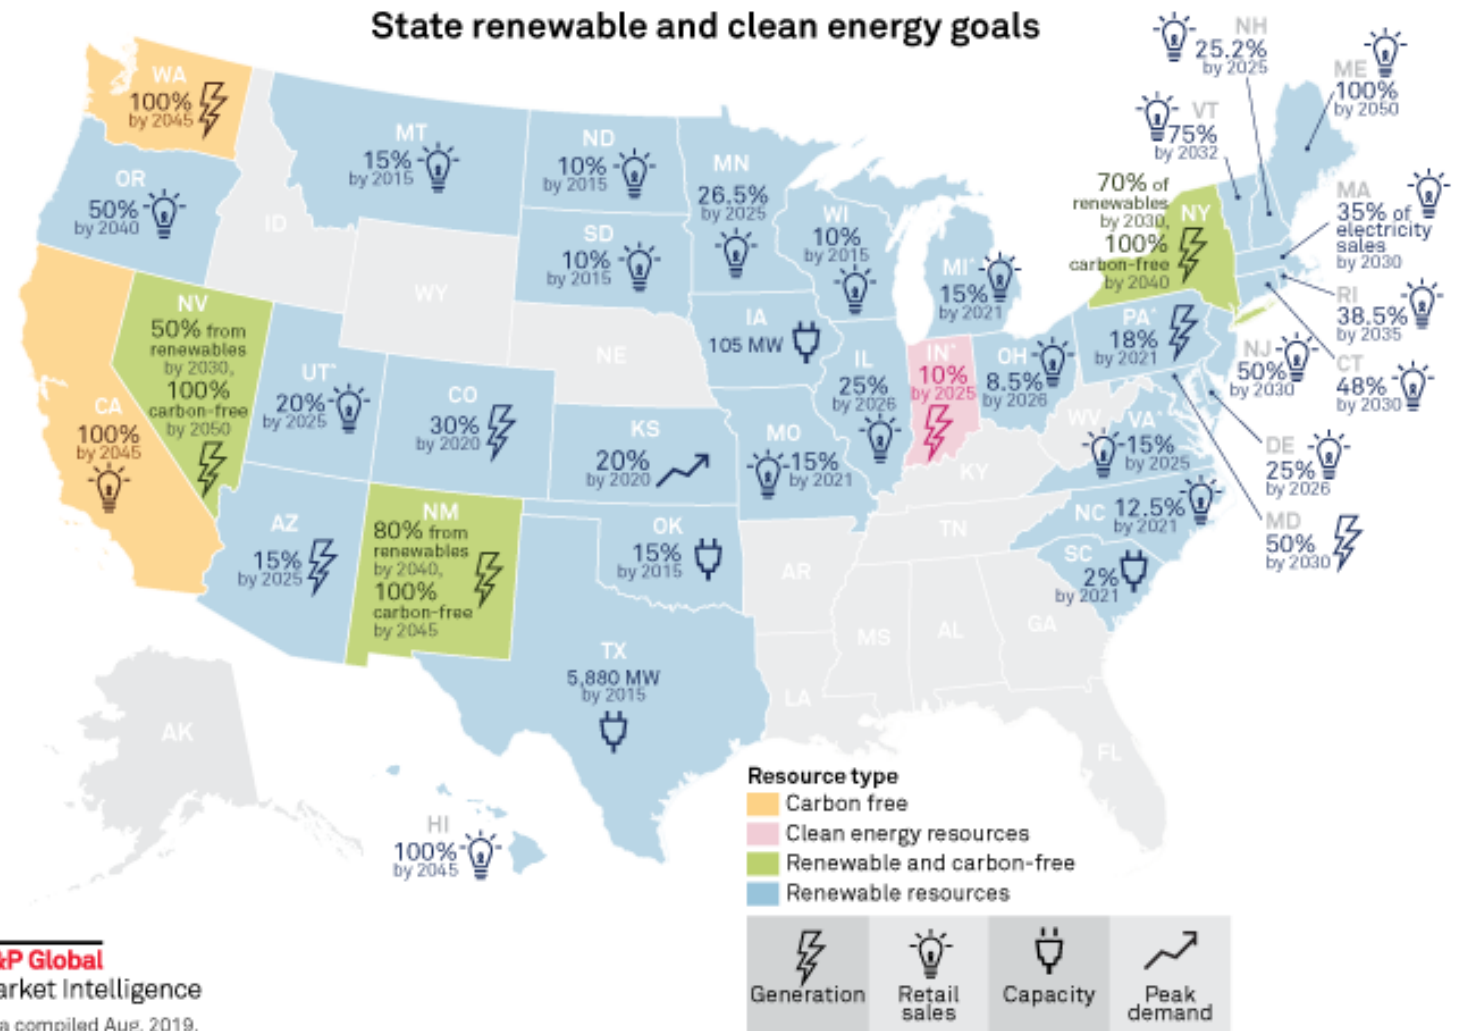

# Overview

- Problem Statement
- Overview of Thermal Energy Storage for Grid Applications
- Process Heat for Industrial Decarbonization

**Large-capacity, long-duration energy storage solutions<sup>1</sup> will be needed to ensure grid performance<sup>2</sup> with increasing intermittent renewables**

**S&P Global**  
Market Intelligence

Data compiled Aug. 2019.

\* Includes non-renewable alternative resources.

Indiana, Kansas, North Dakota, Oklahoma, South Carolina, South Dakota, Utah and Virginia have renewable portfolio goals instead of standards. Virginia's RPS goal is based on the volume of electricity sold in 2007.

<sup>1</sup>LDES market is nascent

<sup>2</sup>Stability, reliability, resilience

# Energy Storage Capacity and Duration

Adapted from Moller, K.T., T.R. Jensen, E. Akiba, and H.W. Li, 2017, Hydrogen - A sustainable energy carrier, *Progress in Natural Science-Materials International*, 27(1), p. 34-40

# Li-Ion vs. Thermal Energy Storage Capacity

Battery data from U.S. Energy Information Administration (June 5, 2018)

CSP data from <https://solarpaces.nrel.gov/projects>

CSP = concentrating solar power

# Overview

- Problem Statement
- Overview of Thermal Energy Storage for Grid Applications
- Process Heat for Industrial Decarbonization

# Thermal Energy Storage - Overview

- Sensible (single-phase) storage
  - Use temperature difference to store heat
  - Molten salts (nitrates  $< 600\text{ }^{\circ}\text{C}$ ; carbonates, chlorides  $700 - 900\text{ }^{\circ}\text{C}$ )
  - Solids storage (graphite, concrete, ceramic particles),  $> 1000\text{ }^{\circ}\text{C}$

- Phase-change materials
  - Use latent heat to store energy (e.g., molten salts, metallic alloys)

- Thermochemical storage
  - Converting thermal energy into chemical bonds (e.g., decomposition/synthesis, redox reactions)

Molten Aluminum Alloy Phase Change

# Molten-Salt Thermal Storage

# 9 Concentrating Solar Power and Thermal Energy Storage

# Molten Salt Storage with CSP

- Nearly 30 GWh<sub>e</sub> of global capacity using concentrating solar power (CSP)

[futureenergyweb.es](http://futureenergyweb.es)

Solana Parabolic Trough Plant, AZ  
(280 MW<sub>e</sub> with 6 hrs storage (1.5 GWh<sub>e</sub>))

Crescent Dunes Solar Tower, NV  
110 MW<sub>e</sub> with 10 hrs storage (1.1 GWh<sub>e</sub>)

# Moving Particle Thermal Storage

# Moving Particle Thermal Storage with CSP

## High-Temperature Particle-Based CSP

# Moving Particle Thermal Storage with CSP

## High-Temperature Particle-Based CSP

National Solar Thermal Test Facility  
Sandia National Laboratories

# Moving Particle Thermal Storage with CSP

## High-Temperature Particle-Based CSP

- Higher temperatures ( $>1000\text{ }^{\circ}\text{C}$ ) than molten nitrate salts
- Direct heating of particles vs. indirect heating of tubes
- No freezing or decomposition
  - Avoids costly heat tracing
- Direct storage of hot particles

# Gen3 Particle Pilot Plant (Sandia)

Next-Generation High-Temperature Falling  
Particle Receiver

## Gen 3 Particle Pilot Plant

- ~1 - 2  $MW_t$  receiver
- 6  $MWh_t$  storage
- 1  $MW_t$  particle-to- $sCO_2$  heat exchanger
- ~300 - 400 micron ceramic particles (CARBO HSP 40/70)

K. Albrecht, SNL

# Gen3 Particle Pilot Plant (Sandia)

High-Temperature Particle Storage Bin  
(Allied Mineral Products, Matrix PDM, Sandia)

## Gen 3 Particle Pilot Plant

- ~1 - 2  $MW_t$  receiver
- 6  $MWh_t$  storage
- 1  $MW_t$  particle-to- $sCO_2$  heat exchanger
- ~300 - 400 micron ceramic particles (CARBO HSP 40/70)

K. Albrecht, SNL

# Gen3 Particle Pilot Plant (Sandia)

High-Temperature Particle-to-sCO<sub>2</sub> Heat Exchanger  
(VPE, Solex, Sandia)

<https://www.solexthermal.com/our-technology/cooling/>

## Gen 3 Particle Pilot Plant

- ~1 - 2 MW<sub>t</sub> receiver
- 6 MWh<sub>t</sub> storage
- 1 MW<sub>t</sub> particle-to-sCO<sub>2</sub> heat exchanger
- ~300 - 400 micron ceramic particles (CARBO HSP 40/70)

K. Albrecht, SNL

# NREL (Z. Ma) – Moving Particle Thermal Storage

“ENDURING” Long Duration Energy Storage – ARPA-E DAYS program

Electrical resistive heating of moving particles

# Fixed-Bed Thermal Storage

# Solid Particle Storage – Fixed Bed

Siemens Gamesa Electric Thermal Energy Storage pilot demonstration with thermal storage capacity of 130 MWh at temperatures of 750 °C (image from [website](#)).

# THERMS – Terrestrial Heat Repository for Months of Storage

NM Small Business Assistance Program with CSolPower, 2020

DOE Energy I-Corps, Cohort 12, Team 137 (March - May, 2021; C.Ho, H. Laubscher, K. Guin, S. Willard, G. Ho)

THERMS provides low-cost, large-capacity, **long-duration energy storage** for a carbon-free electrical grid and high-temperature process heat.

# Overview

- Problem Statement
- Overview of Thermal Energy Storage for Grid Applications
- Process Heat for Industrial Decarbonization

# Industrial Decarbonization

## Total U.S. Greenhouse Gas Emissions by Economic Sector in 2019

Total U.S. Emissions in 2019 = 6.6 billion metric tons of CO<sub>2</sub> equivalent.

<https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions>

Nearly a **quarter** of all greenhouse gas emissions in the U.S. are from **Industrial Processes and Manufacturing**

Cement  
and steel  
production

Food processing and drying

Chemicals

Electrification/automation

Petroleum refining

# Untapped Potential for Industrial Heat

## ENORMOUS GLOBAL HEAT DEMAND IN INDUSTRY

TOTAL FINAL ENERGY CONSUMPTION 2014: 360 EJ (EXAJOULE, see Glossary page 17); IEA [1]

# Untapped Potential for Industrial Heat

“Overall, renewable heating potential remains vastly underexploited and deployment is not in line with global climate targets, calling for greater ambition and stronger policy support.”

-International Energy Agency  
<https://webstore.iea.org/renewables-2019>

# Summary

# Summary

- **Thermal storage technologies** can provide **long-duration energy storage** (GWh) – **market is nascent**
- **Moving particles and fixed-bed storage** (**CSP** and **electrical heating**)
  - Very low cost, “dirt cheap”
- Untapped potential to address **industrial decarbonization**
  - High-temperature **process heat**
    - Hydrogen
    - Solar thermal
    - Electrification

Solana Parabolic Trough Plant, AZ

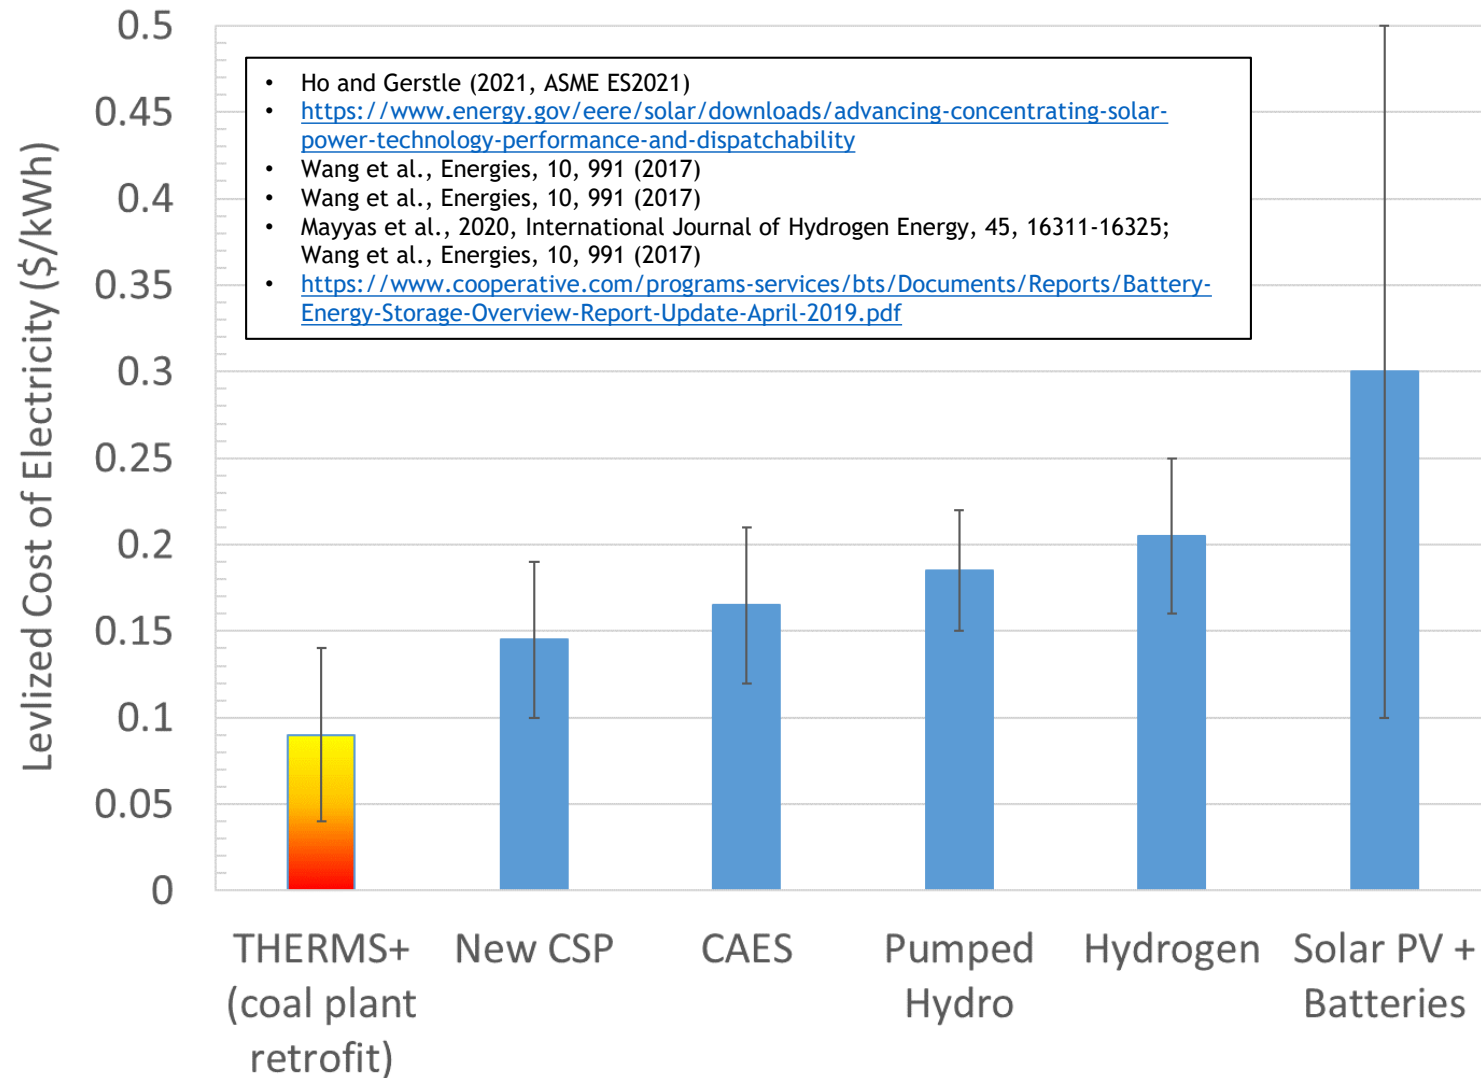

# Acknowledgments

- This work was funded by
  - DOE Office of Energy Efficiency & Renewable Energy
    - Solar Energy Technologies Office (CSP Program)
  - DOE Office of Electricity
  - DOE Office of Technology Transitions (Energy I-Corps)
  - New Mexico Small Business Assistance Program

# Backup Slides

# Costs and Competition

THERMS cost parameters (Ho and Gerstle, 2021)

Initial Capital Cost		4 hr	168 hrs
Unit cost of basalt gravel	\$/m <sup>3</sup>	20	20
Unit cost of excavation	\$/m <sup>3</sup>	20	20
Cost of electric heater and air fan	million \$	1.00	1.00
Cost of controls	million \$	1.00	1.00
Cost of ducting	million \$	1.00	1.00
Cost of land	million \$	0.00	0.00
Site improvement cost	million \$	0.10	0.10
Connection to heat recovery steam turbine, etc.	million \$	2.00	2.00
Cost of engineering	million \$	0.34	1.33
Cost of construction contracting	million \$	0.51	1.99
Cost of owner activities	million \$	0.11	0.44
Gross Receipts Tax on Direct Costs	percent	6.25	6.25
Initial Capital Cost	million \$	7.10	27.54
CAPEX capital expenditure per kWh	\$/kWh	31.68	2.93
Cost of Financing			
Lifetime of facility	years	30	30
Nominal interest rate, R	per year	0.06	0.06
Inflation rate, i	per year	0.02	0.02
Real Interest rate, r (discount rate)	per year	0.04	0.04
Capital Recovery Factor (CRF)	per year	0.06	0.06
Annualized Capital Cost = CRF*Initial Capital Cost	million \$	0.41	1.58
Operation and Maintenance (O&M) Cost			
Number of employees	-	2	2
Loaded cost of employee per year	Million \$/yr	0.10	0.10
Total cost of employees per year	Million \$/yr	0.20	0.20
Cost of repairs per year	Million \$/yr	1.0	1.0
Annual Operating and Maintenance Cost	Million \$ per year	1.2	1.2
Cost of Purchased Electricity			
Cost of electricity for charging	\$/kWh	0.03	0.03
Cost per year to charge for environmental losses	Million \$	0.04	1.56
Cost per year to charge for electricity produced	Million \$	3.99	1.64
Annual Cost of Purchased Electricity	Million \$ / yr	4.03	3.2

# Market Incentive – Cost Avoidance for Coal Plants

- Average cost of pumped hydro, CAES, hydrogen, or long-duration battery storage = **~\$0.20/kWh<sup>1</sup>**
- Average cost of THERMS+ = **~\$0.10/kWh<sup>2</sup>**
- **Annual cost savings for utility:**
  - ~\$10B/year in U.S.\*
  - ~\$100B/year globally
  - On average, each major utility can **save ~\$100M per year** using THERMS+ relative to other storage options\*\*

In 2019, 241 coal plants with **capacity of 236 GW**

>10% of coal plants in U.S. have >20 years of useful life and will be retiring within 10 years due to emission-reduction mandates

\*236 GW x 10% x 1e6 kW/GW x 8760 hours/year x 0.5 (capacity factor) x \$0.10/kWh (savings) = \$10B/year

\*\*Assumes ~100 - 200 major utilities; additional savings to utility possible by using existing transmission

<sup>1</sup>Wang et al., Energies, 10, 991 (2017); Mayyas et al., 2020, International Journal of Hydrogen Energy, 45, 16311-16325; Wang et al., Energies, 10, 991 (2017); Ahlen et al. (2019)

<sup>2</sup>Ho and Gerstle, ASME ES2021, 2021

# Revenue Potential

- For every \$0.01/kWh<sub>e</sub> we charge for profit after ~\$0.10/kWh<sub>e</sub> to build THERMS+, we will earn **\$44M profit per retrofitted 1 GW coal plant\***
- **SOM ~\$1B in the U.S.**
  - ~20 plants x \$44M = ~\$1B

\*1 GW x 1e6 kW/GW x 8760 hours/year x 0.5 (capacity factor) x \$0.01/kWh<sub>e</sub> = \$44M

# Thermal Energy Storage (Sensible) - Specifications

Ho, 2016, *Applied Thermal Engineering*, 109 (2016) 958-969; Siegel, 2012, *Wiley Interdisciplinary Reviews: Energy And Environment*, 1(2), 119-131.

Metric	Values	
	Solid Particles	Molten Nitrate Salt
Levelized Cost (\$/MWh <sub>e</sub> )	10 - 13	11 - 17
Round-trip efficiency	>98% (thermal in/out)	>98% (thermal in/out)
Energy density (MJ/m <sup>3</sup> )	~400 - 900	~600 - 900
System life	30 yrs (>10,000)	30 yrs (>10,000)
Toxicity/ environmental impacts	N/A	Reactive with piping materials
Restrictions/ limitations	Particle/fluid heat transfer can be challenging	decomposes above ~600 °C

# Summary of Advantages and Challenges

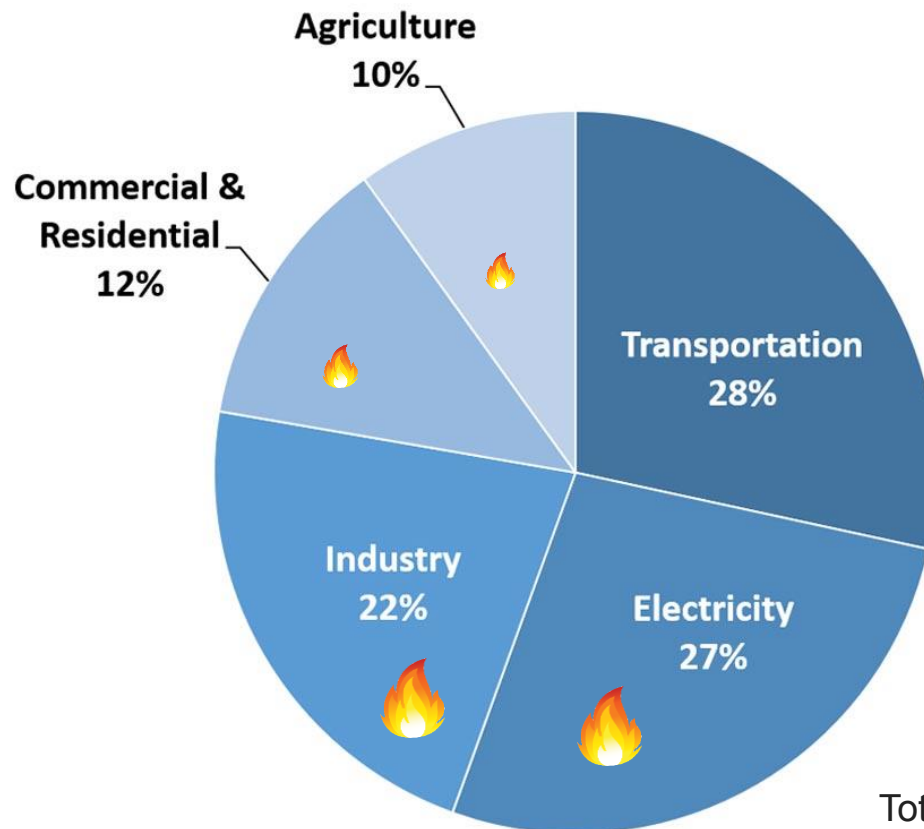

Storage Technology	Advantages	Challenges
Pumped Hydro	<ul style="list-style-type: none"> <li>▪ Mature technology</li> <li>▪ Demonstrated large capacity (~GWh); &gt;90% of U.S. grid energy storage</li> <li>▪ Good reliability</li> </ul>	<ul style="list-style-type: none"> <li>▪ Unique geologic resources and water availability</li> <li>▪ Improved turbines and electrical systems</li> <li>▪ Small modular pumped hydro systems</li> </ul>
Compressed Air	<ul style="list-style-type: none"> <li>▪ Demonstrated capability at large scales</li> <li>▪ Moderate round-trip efficiency</li> <li>▪ Good potential for long-duration storage</li> </ul>	<ul style="list-style-type: none"> <li>▪ Unique geologic resources</li> <li>▪ Well integrity</li> <li>▪ Repository integrity</li> </ul>
Hydrogen	<ul style="list-style-type: none"> <li>▪ Can be stored in large capacities for long periods of time</li> <li>▪ Can be used for both grid and transportation</li> <li>▪ Environmentally friendly</li> </ul>	<ul style="list-style-type: none"> <li>▪ Low round-trip efficiency of hydrogen production and storage</li> <li>▪ High cost</li> <li>▪ Leakage and safety of hydrogen gas</li> </ul>
Thermal (Sensible)	<ul style="list-style-type: none"> <li>▪ Mature technology</li> <li>▪ Demonstrated large capacity with concentrating solar power (~GWh)</li> <li>▪ Low cost</li> </ul>	<ul style="list-style-type: none"> <li>▪ Heat loss</li> <li>▪ Large volumes required</li> <li>▪ Heat exchanger performance and cost</li> </ul>
Thermochemical	<ul style="list-style-type: none"> <li>▪ Large energy density</li> <li>▪ Potential for long-duration storage</li> </ul>	<ul style="list-style-type: none"> <li>▪ Low maturity</li> <li>▪ High cost</li> <li>▪ Material durability and kinetics</li> </ul>

# Heat Generation Contributes Significantly to CO<sub>2</sub> Emissions

## Total U.S. Greenhouse Gas Emissions by Economic Sector in 2018

- In 2018, heat accounted for
- 50% of global end-use energy consumption
  - 40% of global CO<sub>2</sub> emissions

-International Energy Association

<https://www.iea.org/reports/renewables-2019/heat>

Total Emissions in 2018 = 6,677 Million  
Metric Tons of CO<sub>2</sub> equivalent.
