

# Hurry up or take your time: kinetics of shock-driven phase transitions and dynamic x-ray diffraction

PRESENTED BY

Patricia Kalita, SNL

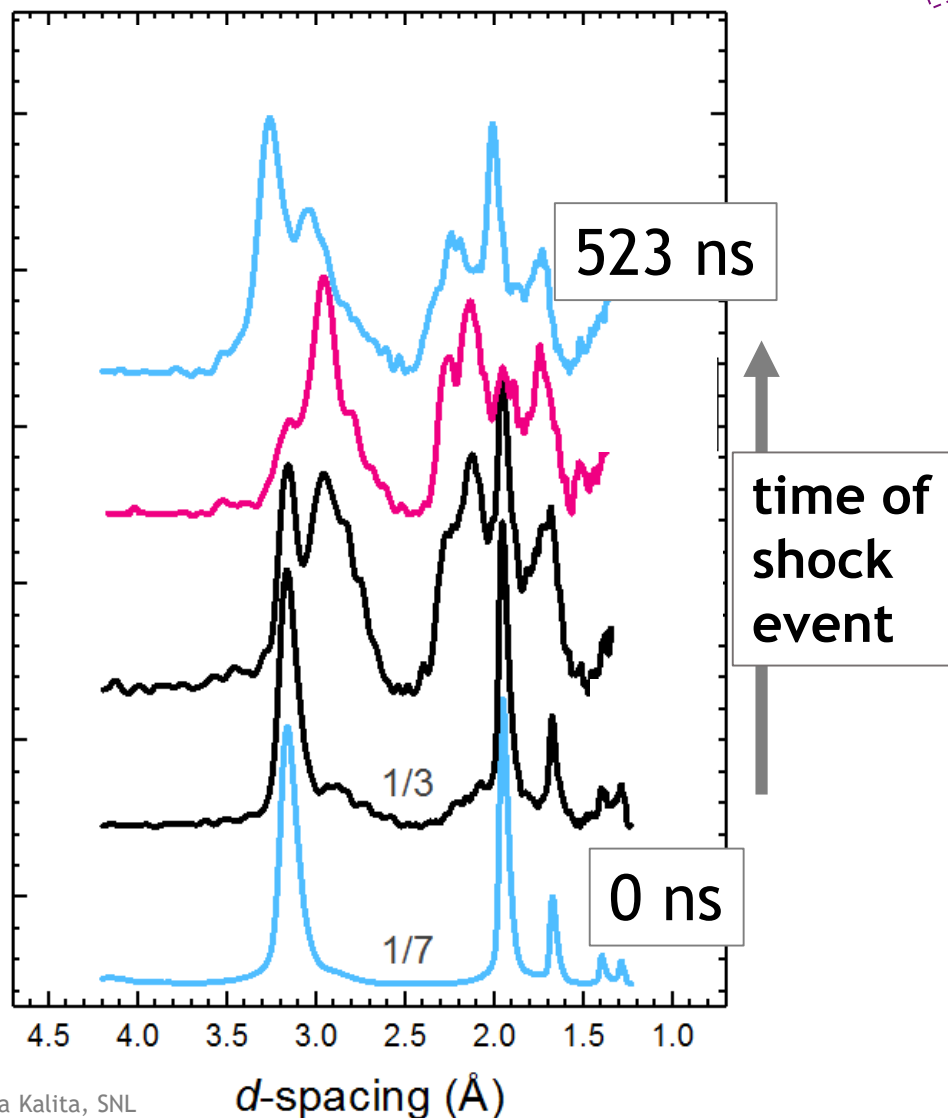

APS March 2020 Meeting - Invited Talk  
Session L03: Materials in Extremes: Phase Transitions  
03-04-20 - 9:12 am-9:48 am

## In collaboration with the following awesome scientists:

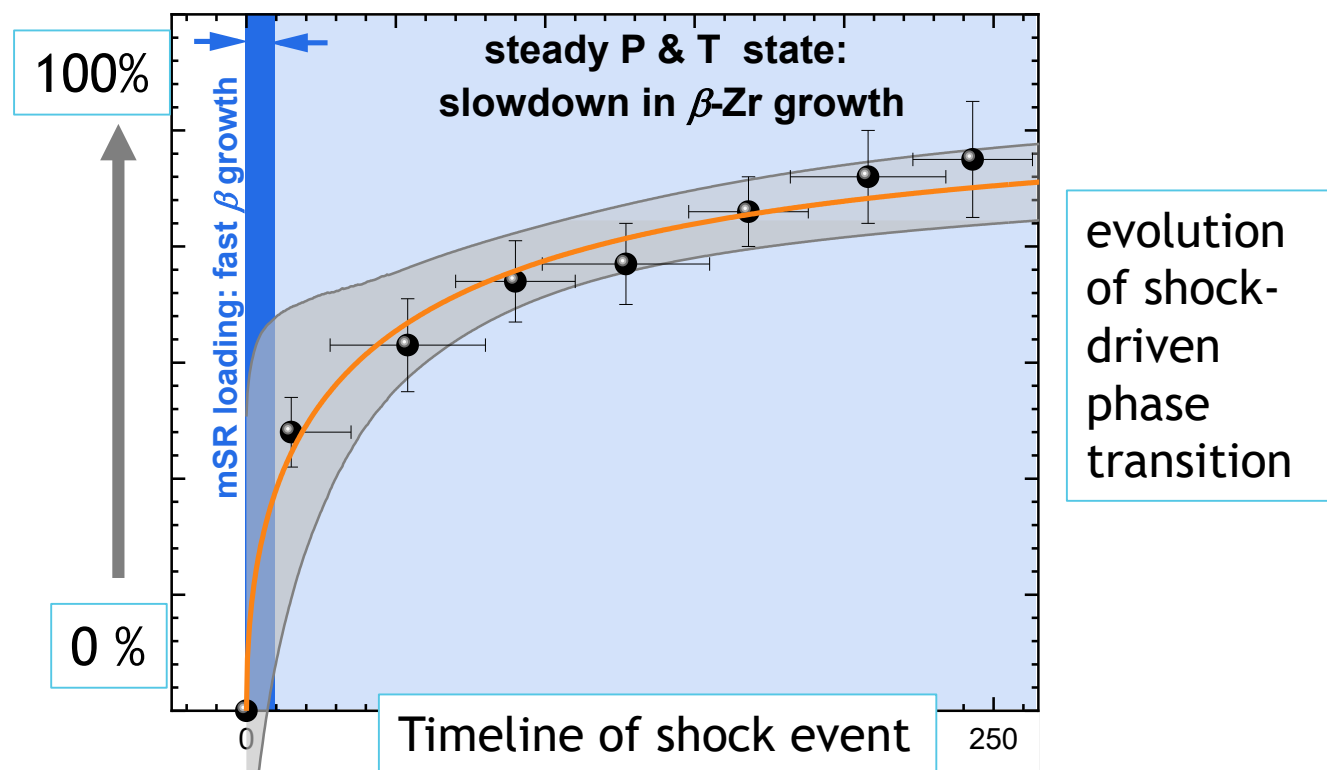

- Justin Brown, Paul Specht, and Seth Root, SNL
- Melanie White, Andrew Cornelius, UNLV
- Jesse S. Smith, HPCAT, APS – ANL
- Nicholas Sinclair, Adam Schuman, Paulo Rigg, DCS, WSU & APS – ANL

**DXRD**

with dynamic XRD (DXRD), we get a microscopic insight into shock processes,

- we can quantify the kinetics of shock-driven phase transition at nanosecond scales

Application? help in validating of kinetics' models for phase transitions in shock processes

1. DXRD & Shock compression at DCS, APS - ANL
2. XRD & Static compression at HPCAT, APS - ANL
3.  $\text{CaF}_2$  structures and phase diagram
4. Real-time DXRD probe of a **single-step shock event** in  $\text{CaF}_2$
5. Kinetics of formation of tetragonal  $\text{CaF}_2$  under shock compression
6. Zirconium structures and phase diagram
7. Real-time DXRD probe of a **multi-step shock/release** process in Zr
8. Kinetics of formation of  $\beta$ -Zirconium under shock compression
9. Summary & Takeaways

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock/release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

All about  
experiments

Phase transition  
kinetics in a  
simple ionic solid

Phase transition  
kinetics in a  
metal

# Advanced Photon Source, ANL: DCS and HPCAT

- 3<sup>rd</sup> generation synchrotron source
- 1,104m = 3,622 ft.
- X-rays ON 24h/day
- 6 days/week

X-rays every 154 ns that last for ~100ps

**Sector 35  
DCS**

**Sector 16  
HPCAT**

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3. CaF<sub>2</sub> phase diagram
4. CaF<sub>2</sub>: DXRD and simple shock event
5. CaF<sub>2</sub> & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of β-Zr
9. Takeaways

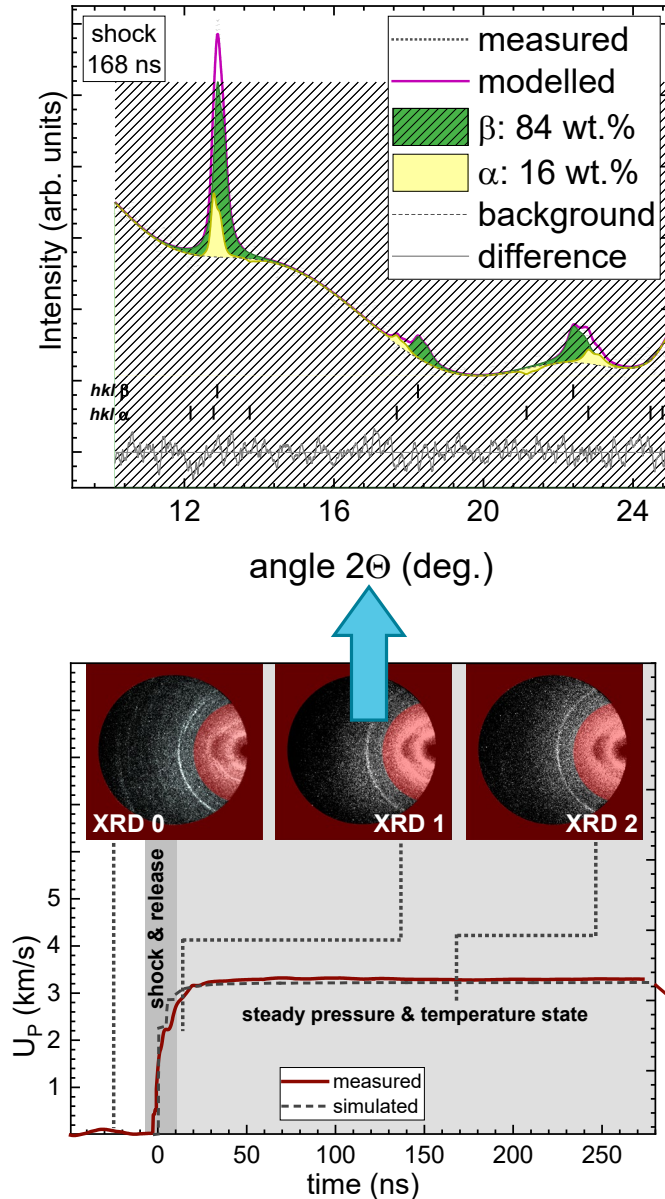

Advanced Photon Source Image Bank ([aps.anl.gov](http://aps.anl.gov))

**DXRD:** dynamic x-ray diffraction  
**DAC:** diamond anvil cell

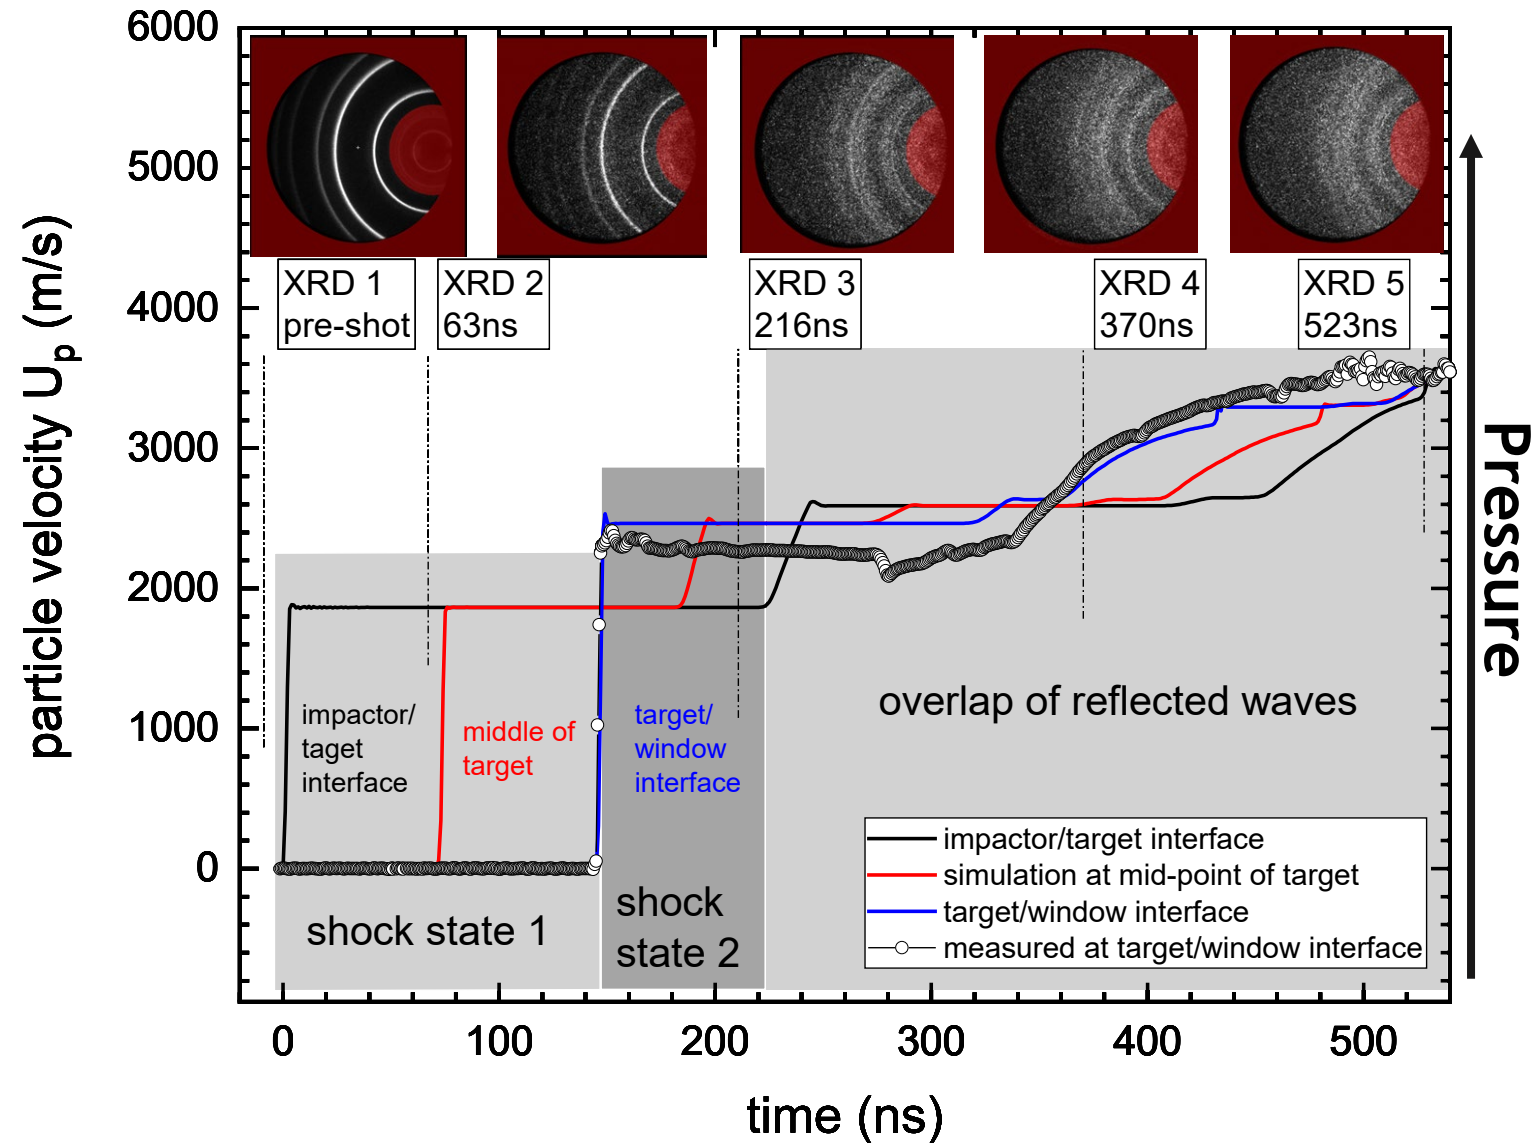

# Dynamic XRD and Shock compression experiments

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

# A steady stress state & kinetics of phase transitions: DXRD & single-step shock event

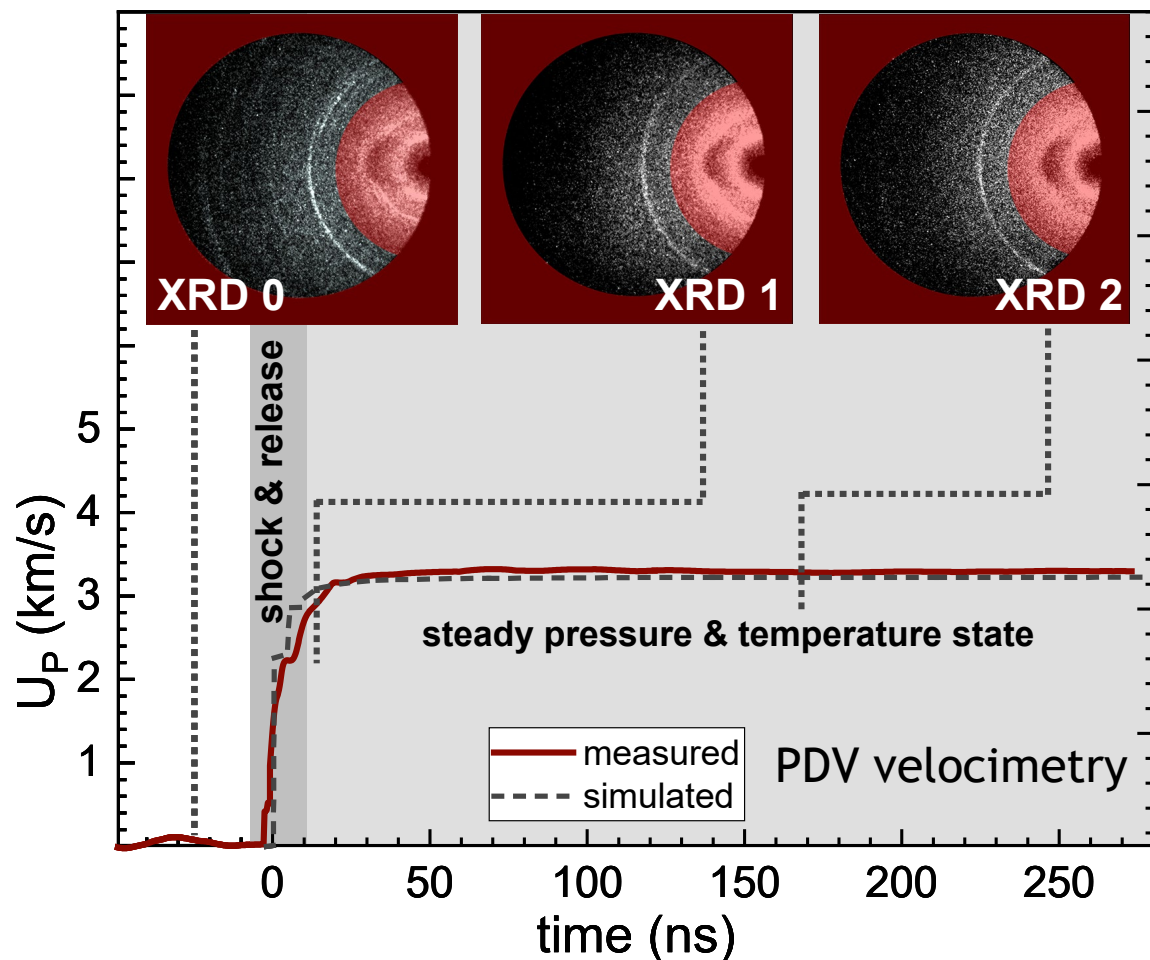

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta\text{-Zr}$
9. Takeaways

# A steady stress state & kinetics of phase transitions: DXRD & a multi-shock-release process

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

- Steady, well defined P & T state
- Great for quantitative XRD analysis

# Companion experiments: static DAC compression & XRD

Unit Cell Volume

Pressure (GPa)

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

1. DXRD & Shock compression at APS - ANL

2. XRD & Static compression at APS - ANL

3.  $\text{CaF}_2$  structures and phase diagram

4. Real-time DXRD probe of a **single-step shock event** in  $\text{CaF}_2$

5. Kinetics of formation of tetragonal  $\text{CaF}_2$  under shock compression

Phase transition  
kinetics in a  
simple ionic solid

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock/release process
8. Zr & shock: kinetics of formation of  $\beta\text{-Zr}$
9. Takeaways

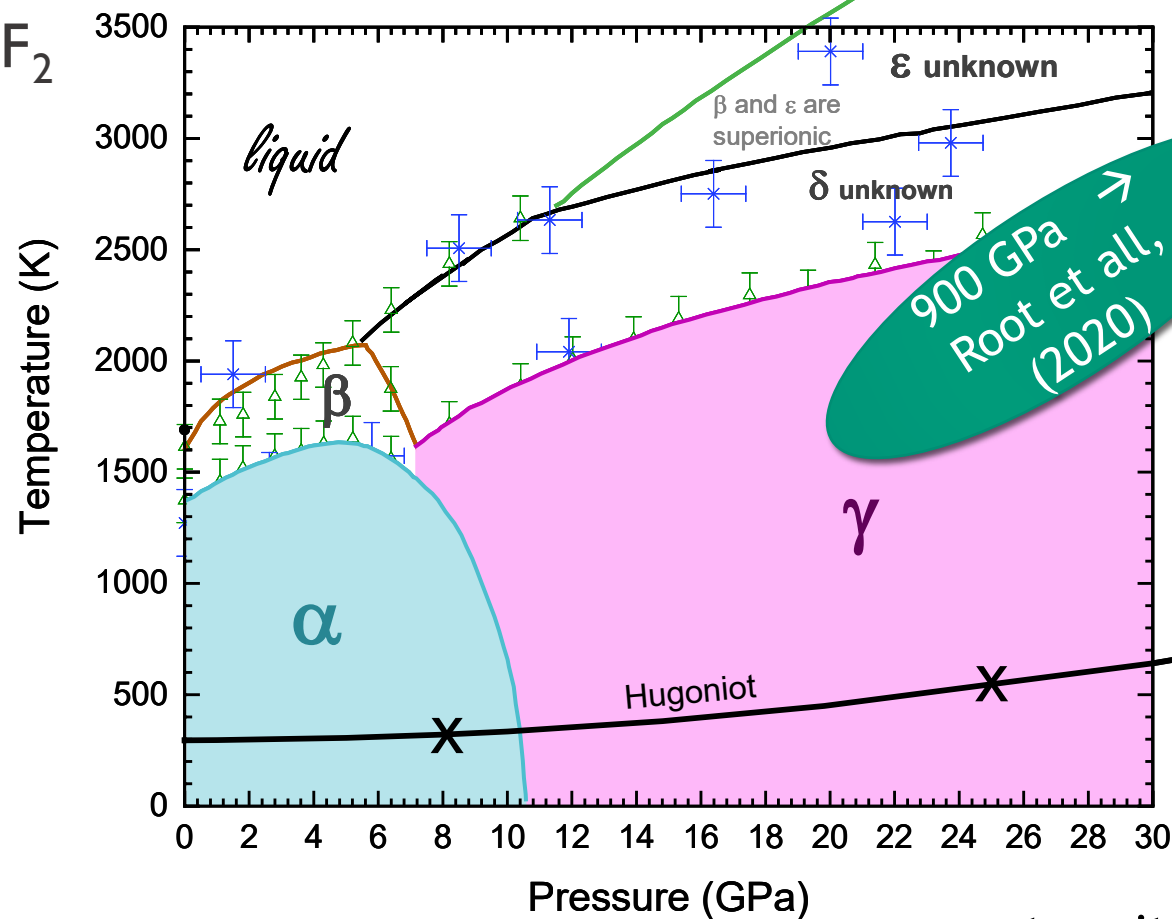

# Single-step shock compression of $\text{CaF}_2$

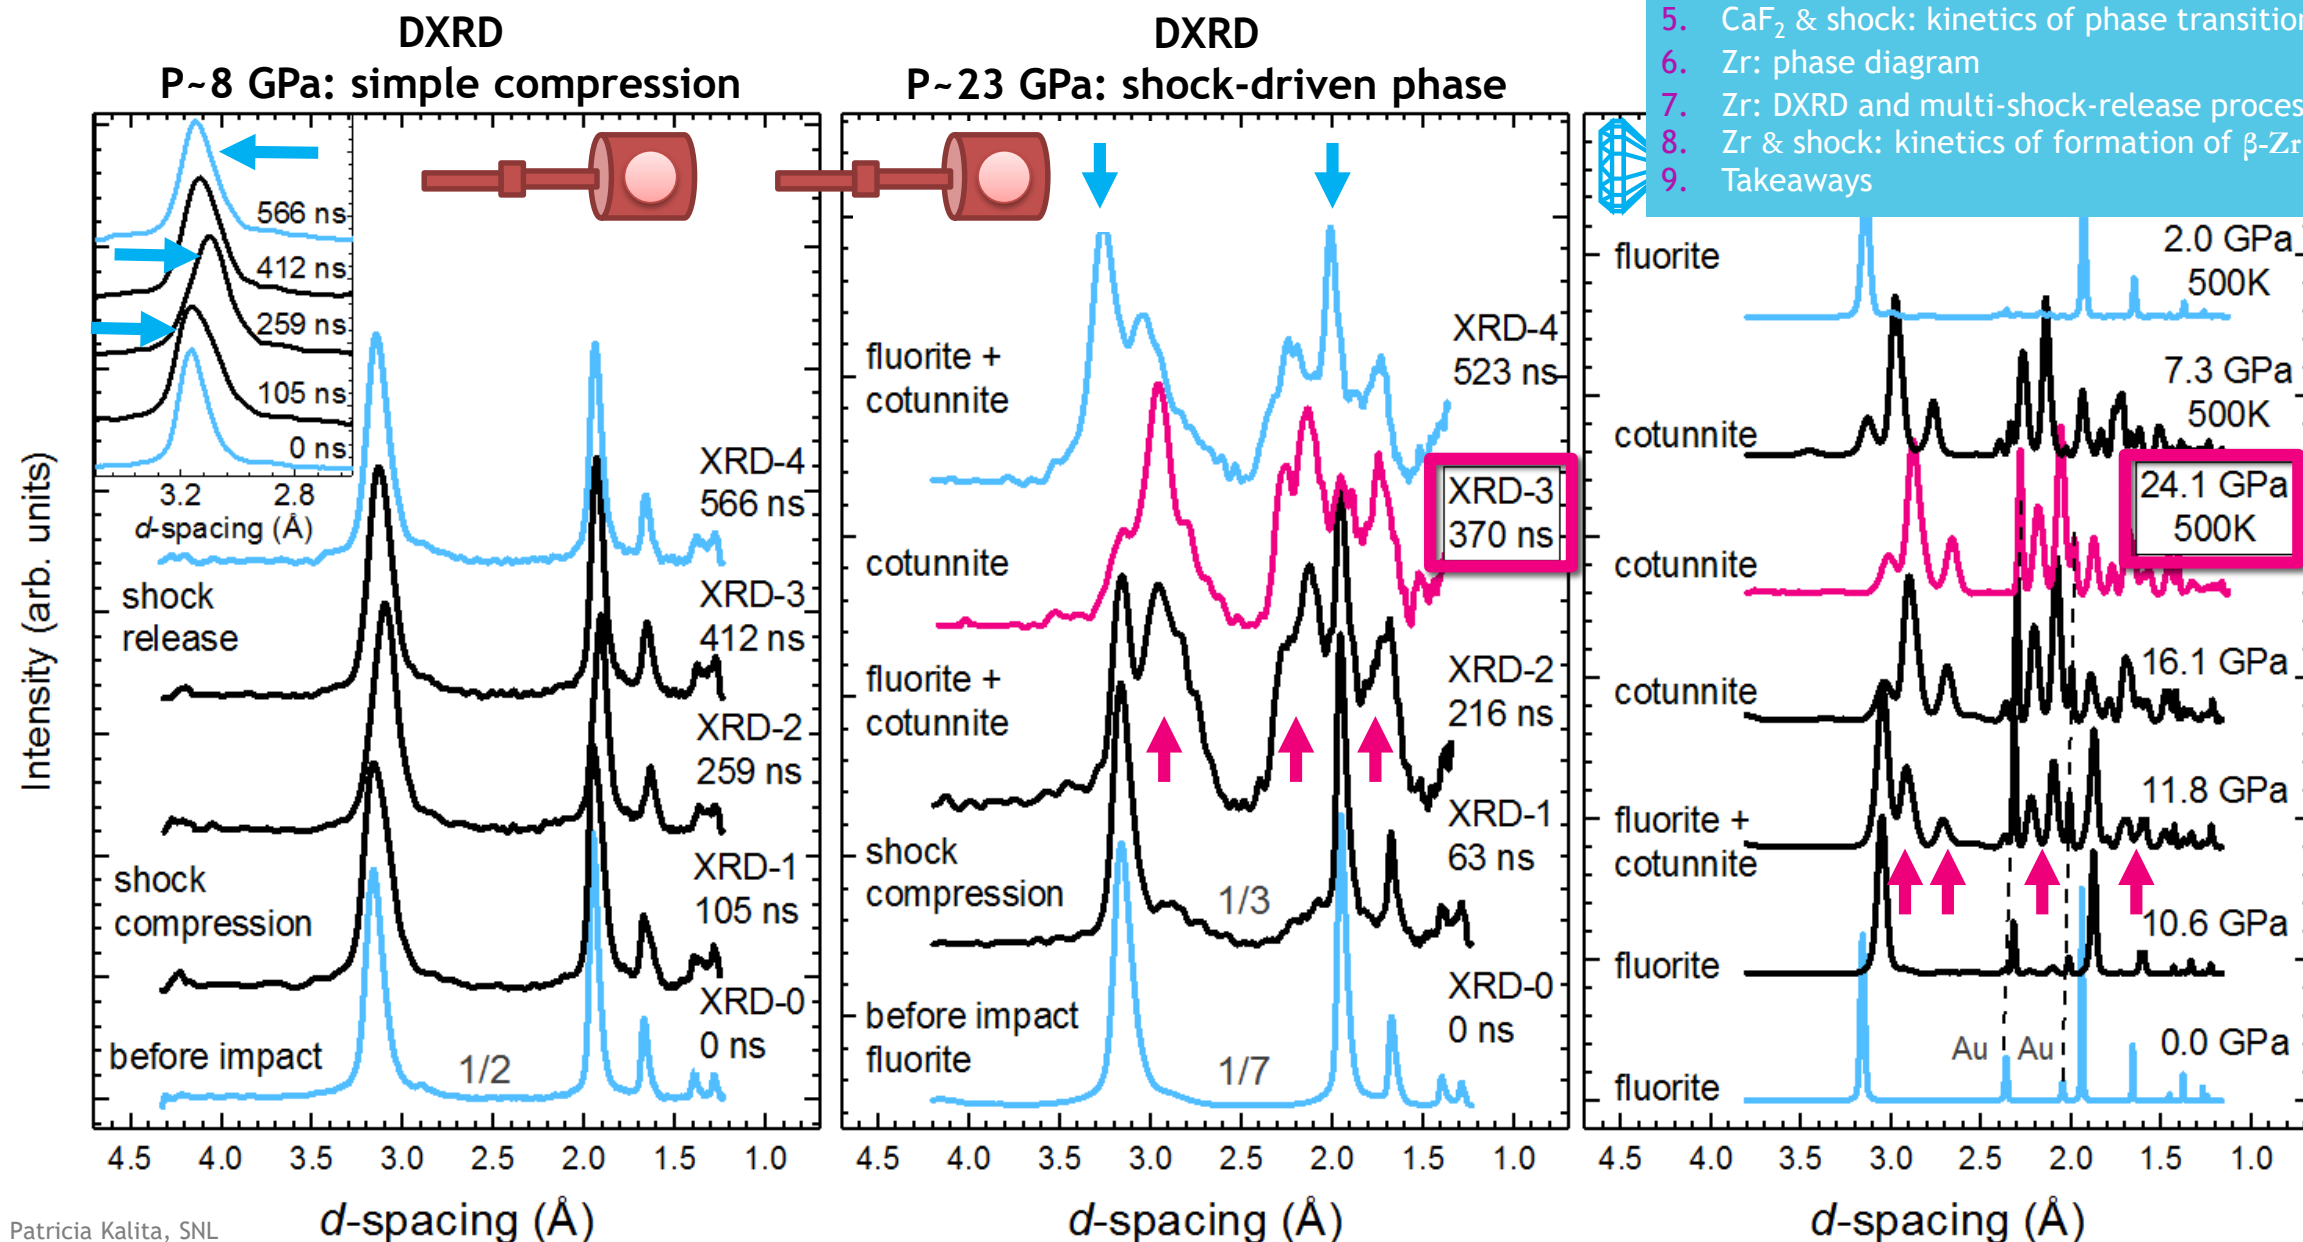

- part of a larger project on shock/ramp/static loading behavior of  $\text{CaF}_2$
- limited Hugoniot data above 30 GPa
- high pressure Hugoniot phase (solid or melt) undetermined
- extended phase diagram undetermined
- previous shock compression:** continuum scale velocimetry & inferred phase transition
- static compression:** at least 2 solid  $\rightarrow$  solid pressure-driven phase transitions

 Cazorla, PRL 113, 235902 (2014)  
 Dorfman et al., Phys. Rev. B 81, 174121 (2010)

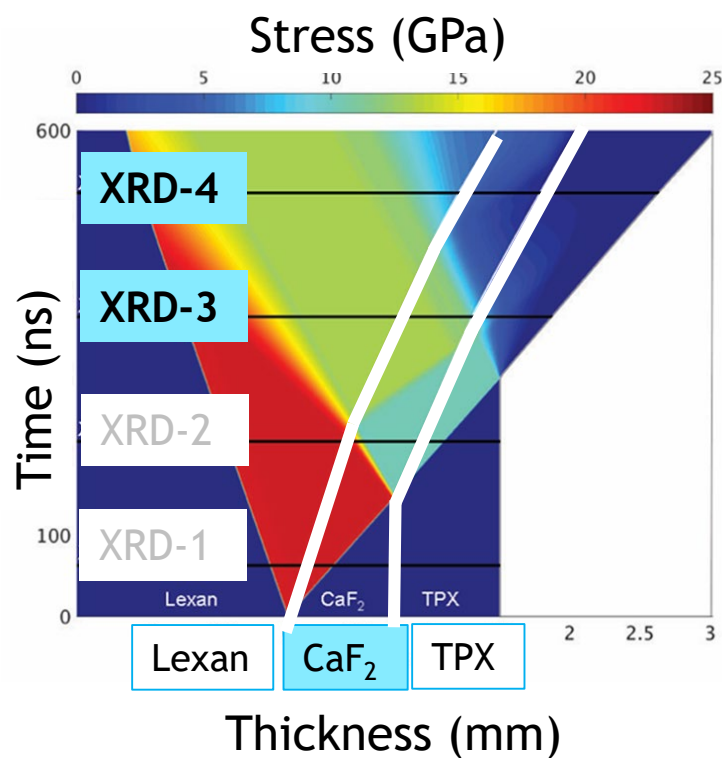

# Shock-driven phase transition at atomic and nanosecond scales in $\text{CaF}_2$

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

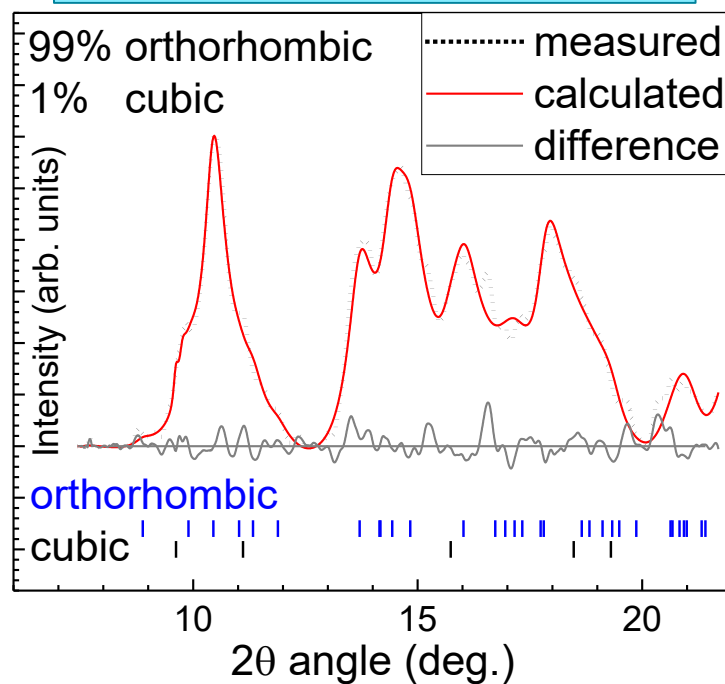

# DXRD analysis

at late times > 140 ns material is subjected to distribution of pressures

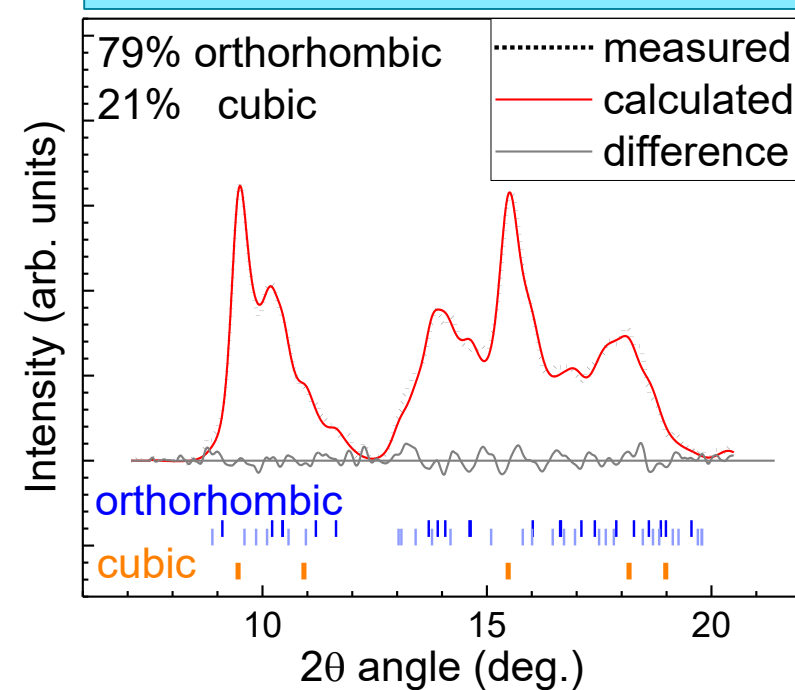

**XRD-3  $\sigma \sim 13$  GPa  $t=370$ ns**

- complete phase transition fluorite  $\rightarrow$  cotunnite

**XRD-4  $6 > \sigma > 1$  GPa  $t=523$ ns**

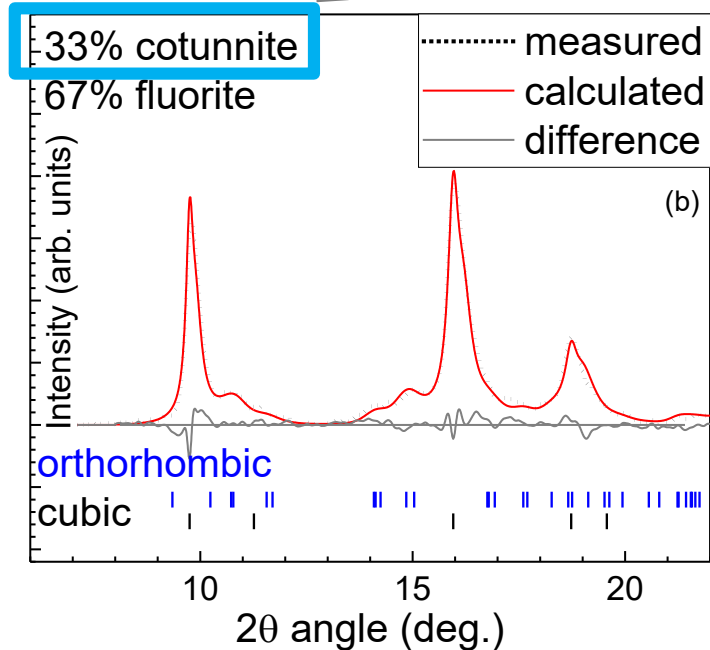

- reversible transition
- hysteresis on stress release

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3. CaF<sub>2</sub> phase diagram
4. CaF<sub>2</sub>: DXRD and simple shock event
5. CaF<sub>2</sub> & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

# Quantitative DXRD analysis: kinetics of shock-driven phase transition

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

1. DXRD & Shock compression at APS - ANL
2. XRD & Static compression at APS - ANL

3.  $\text{CaF}_2$  structures and phase diagram
4. Real-time DXRD probe of a simple shock event in  $\text{CaF}_2$
5. Kinetics of formation of tetragonal  $\text{CaF}_2$  under shock compression
6. Zirconium structures and phase diagram
7. Real-time DXRD probe of a multi-shock-release process in Zr
8. Kinetics of formation of  $\beta$ -Zirconium under shock compression

Phase transition kinetics in a simple ionic solid

Phase transition kinetics in a metal

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

# Multiple shock-and-release experiment in Zr

- Bridgman discovered the  $\omega$  phase in 1952 <sup>[1]</sup>
- a lot of studies on  $\alpha$  (hcp)  $\rightarrow$   $\omega$  (hexagonal)
- $\omega$  (hexagonal)  $\rightarrow$   $\beta$  (cubic) transition discovered in 1990 <sup>[2]</sup>
- $\beta$  phase is less studied

## this work:

$\rightarrow$  quantify the kinetics of formation of the  $\beta$ -Zr phase under shock compression

[1] P. W. Bridgman, PNAAS 81, 165 (1952).

# Quantifying the kinetics of $\beta$ -Zr under shock compression

## KJMA Model of kinetics

- short incubation time  $\tau \sim 0$  ns and  $\sim 250$  ns needed to complete the transition
- atomic displacement during transition requires tens of ns to complete the process
- the applicability of the KJMA formalism for describing of polymorphic transitions under shock compression must be approached carefully, since it was developed for transformations between isotropic phases with a small volume jump and a zero shear modulus.

$$\beta(t) = 1 - \exp(-(\overset{\text{crystallization rate}}{k})(t - \overset{\text{incubation time}}{\tau}))^{\overset{\text{Avrami parameter}}{N}})$$

1. DXRD and shock compression at APS - ANL
2. XRD and static compression at APS - ANL
3.  $\text{CaF}_2$  phase diagram
4.  $\text{CaF}_2$ : DXRD and simple shock event
5.  $\text{CaF}_2$  & shock: kinetics of phase transition
6. Zr: phase diagram
7. Zr: DXRD and multi-shock-release process
8. Zr & shock: kinetics of formation of  $\beta$ -Zr
9. Takeaways

# Takeaways

- both projects show that we can use DXRD to follow the unfolding of phase transitions during different shock events
- both projects show that we can use quantitative analysis of DXRD patterns to put numbers on how fast a phase transition unfolds during a shock event
- first experimental evidence that, at tens of nanoseconds, **intermediate states are irrelevant in shock compression: the Hugoniot truly is a locus of end states**, which only depend on the initial state and the shock strength
- Outlook: there is a need to develop models of kinetics of phase transition specifically for shock processes
- Outlook: now we are able to use DXRD to generate atomic-scale time-resolved experimental data to validate such models

## Acknowledgements!

- **Sandia National Laboratories** is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC., a wholly owned subsidiary of Honeywell International, Inc., for the U.S. Department of Energy's National Nuclear Security Administration under Contract No. DE-NA-0003525.
- Portions of this work were performed at the **Dynamic Compression Sector**, which is operated by Washington State University under the U.S. Department of Energy (DOE)/National Nuclear Security Administration Award No. DE-NA0002442.
- Portions of this work were performed at **HPCAT (Sector 16), Advanced Photon Source (APS)**, Argonne National Laboratory. HPCAT operations are supported by DOE-NNSA's Office of Experimental Sciences. The Advanced Photon Source is a U.S. Department of Energy
- (DOE) Office of Science User Facility operated for the DOE Office of Science by **Argonne National Laboratory** under Contract No. DE-AC02-06CH11357.
- P. Rigg, N. Sinclair, A. Schuman and the DCS team as well as E. Rod, C. Benson and the HPCAT team.
- **Sheri Payne of MSTS and Lena Pacheco, Nicole Cofer, Josh Usher, Keith Hodge and Randy Hickman of SNL** for invaluable assistance with preparing the experiments.
- **Carrie Blada and Dr. Marius Schollmeier** of SNL created the fabulous! rendering of the DXRD setup.

# 1-D Shock Compression Wave

- Instantaneous discontinuity in  $P$ ,  $E$ ,  $\rho$
- High strain rate
- Energy scattering
- Shear forces
- Puts energy into atoms and molecules
- Creates defects (increases entropy)

What do we get out?

- very high pressure thermodynamic P-v curve - Hugoniot EOS
- test of accuracy of molecular potentials over large compression

+ DXRD

with dynamic XRD, we get a microscopic insight into shock processes,

- We can quantify the kinetics of shock-driven phase transition at nanosecond scales
