**Interpore 2022**

This work was supported by the Laboratory Directed Research and Development program at Sandia National Laboratories and also DOE Office of Fossil Energy project -Science-informed Machine Learning to Accelerate Rear

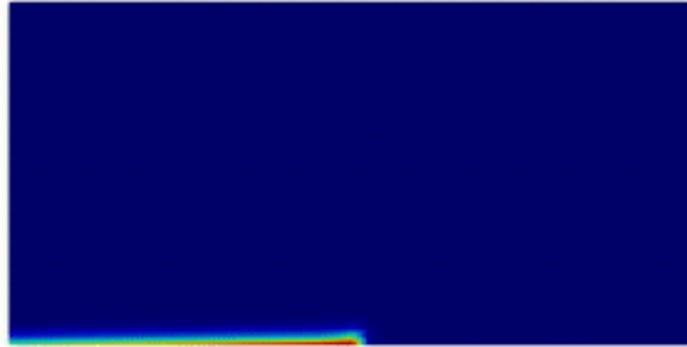

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

# Why reduced order model?

Full order model (FOM) is computationally demanding

This would take 1-2 hours<sup>1,2</sup>

Imagine if you do 100,000 times of this

FOM is computationally very expensive for large-scale uncertainty quantification, optimization, or inverse modeling

<sup>1</sup>Kadeethum et al. (2022, Advances in Water Resources)

<sup>2</sup>Kadeethum et al. (2021, Computers & Geosciences)

# Why non-intrusive approach?

Flexibility

- Or both

FOMs

Schlumberger Eclipse Suite

Sierra Mechanics

non-intrusive ROM

measurement

experiments

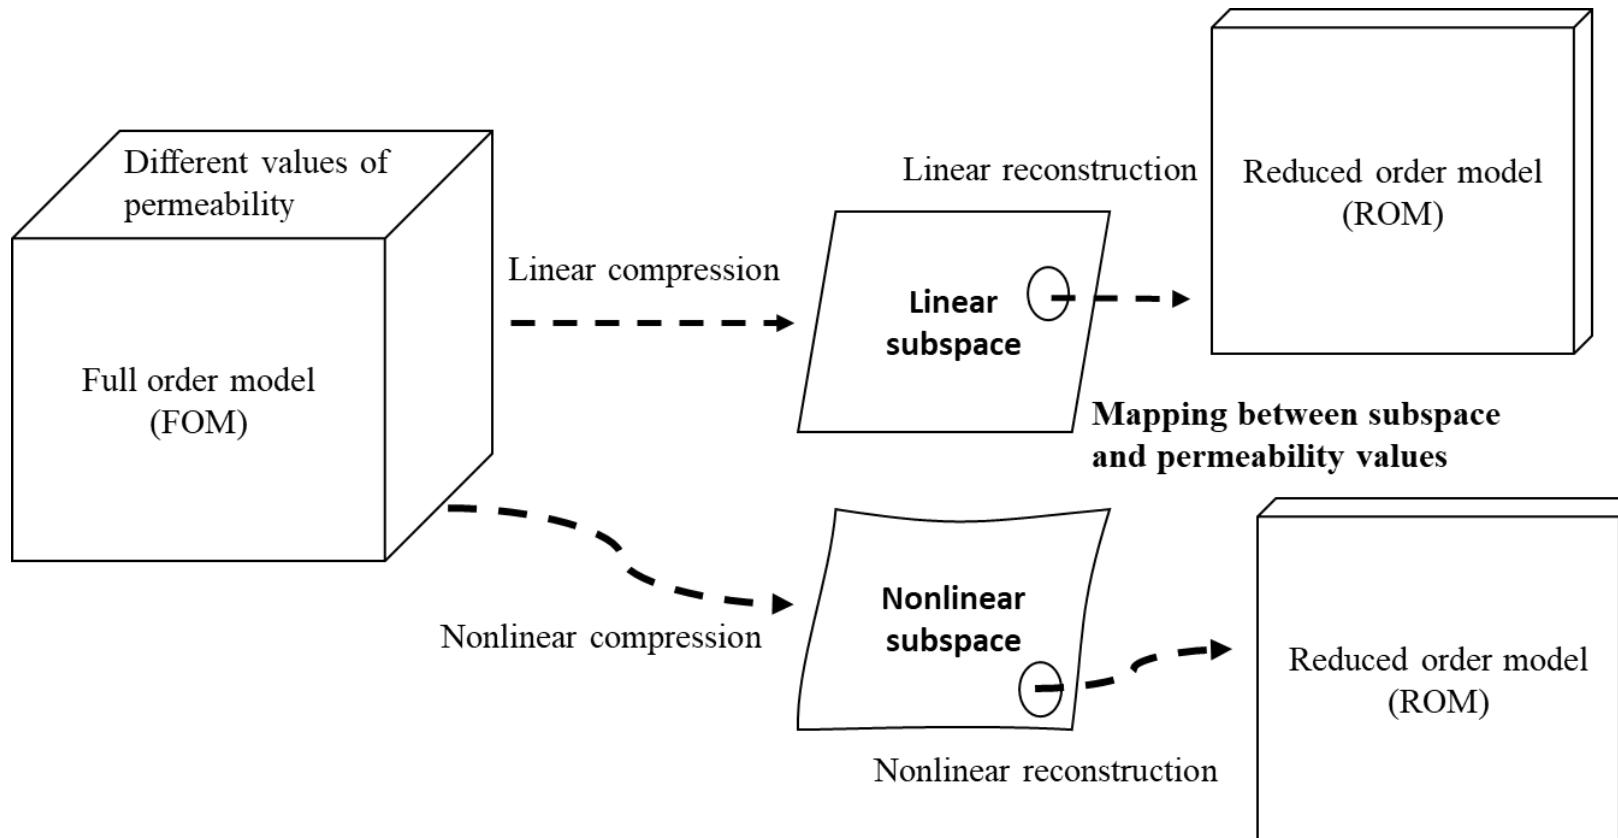

onsite measurement

# Motivation

4

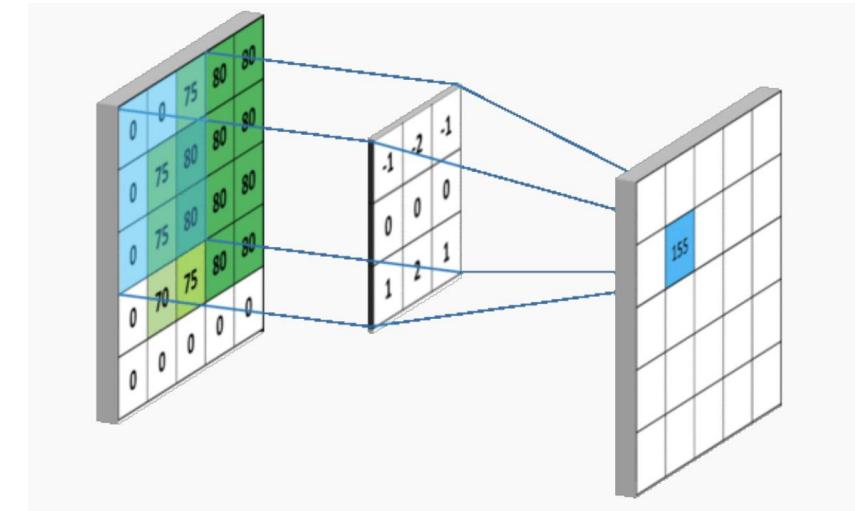

ROM typically works on ‘parameterized PDEs’ and ‘reduced subspace’

# Motivation - continue

1. Unified framework that works well for both problems that lie within **linear** and **nonlinear** manifolds  
(proper orthogonal decomposition (pod) yields optimal data compression for linear manifolds) [1]
2. Framework that does not rely on ‘convolutional layers,’ which makes our framework applicable to both **structured** and **unstructured** meshes [1, 2]

<sup>1</sup>Kadeethum et al. (2022, Advances in Water Resources)

<sup>2</sup>Kadeethum et al. (2021, Nature Computational Science)

<sup>3</sup><https://towardsdatascience.com/simple-introduction-to-convolutional-neural-networks-cdf8d3077bac>

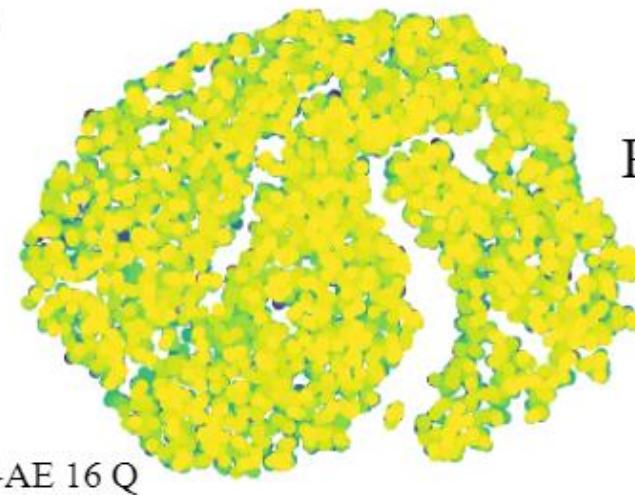

# Motivation - continue

1. We believe the key to develop a good ROM is to produce **better reduced manifolds**.
2. We extend Barlow Twins (BT) self-supervised learning [1], where BT maximizes the information content of the embedding with the latent space through a **joint embedding architecture**

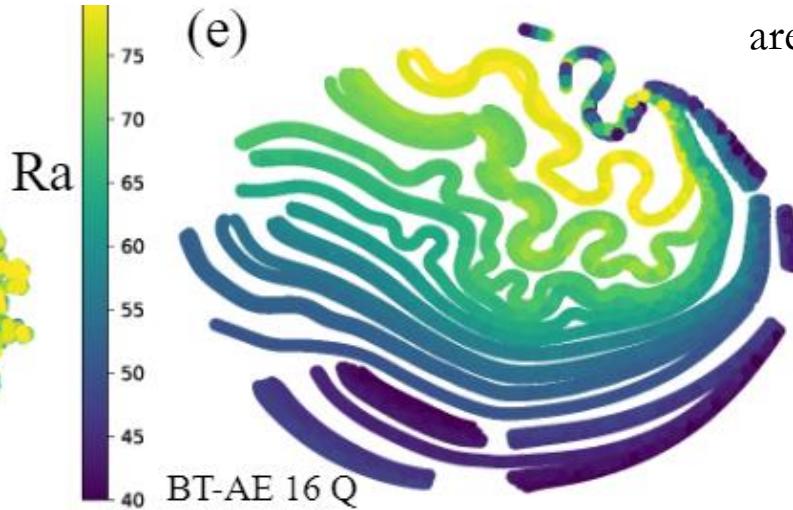

The nonlinear manifolds are not really well structure

(d)

DC-AE 16 Q

(e)

BT-AE 16 Q

The nonlinear manifolds are well structure

# Methodology

## 1. Initialization

Training set:  $\boldsymbol{\mu} = [\boldsymbol{\mu}^{(1)}, \boldsymbol{\mu}^{(2)}, \dots, \boldsymbol{\mu}^{(M-1)}, \boldsymbol{\mu}^{(M)}]$

Validation set:  $\boldsymbol{\mu}_{\text{validation}} = \text{randomly select } 10\% \text{ of } MN^t$

Testing set:  $\boldsymbol{\mu}_{\text{test}} = [\boldsymbol{\mu}_{\text{test}}^{(1)}, \boldsymbol{\mu}_{\text{test}}^{(2)}, \dots, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}}-1)}, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}})}]$

We first initialize training, validation, and testing sets.

These parameters could be material properties, boundary conditions, or parameterized geometry representation.

# Methodology

## 1. Initialization

Training set:  $\boldsymbol{\mu} = [\boldsymbol{\mu}^{(1)}, \boldsymbol{\mu}^{(2)}, \dots, \boldsymbol{\mu}^{(M-1)}, \boldsymbol{\mu}^{(M)}]$

Validation set:  $\boldsymbol{\mu}_{\text{validation}} = \text{randomly select } 10\% \text{ of } MN^t$

Testing set:  $\boldsymbol{\mu}_{\text{test}} = [\boldsymbol{\mu}_{\text{test}}^{(1)}, \boldsymbol{\mu}_{\text{test}}^{(2)}, \dots, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}}-1)}, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}})}]$

## 2. Full order model (FOM)

$$\text{FOM} = \begin{bmatrix} \mathbf{u}_h(\boldsymbol{\mu}^{(1)}), p_h(\boldsymbol{\mu}^{(1)}), T_h(\boldsymbol{\mu}^{(1)}) \\ \vdots \\ \mathbf{u}_h(\boldsymbol{\mu}^{(M)}), p_h(\boldsymbol{\mu}^{(M)}), T_h(\boldsymbol{\mu}^{(M)}) \end{bmatrix}$$

Same goes for  $\boldsymbol{\mu}_v, \boldsymbol{\mu}_t$

We then build the training set through by querying full order model for each parameter.

\*This is the major cost of building data-driven model.

# Methodology

Data compression: training BT-AE model

The machine learning model has one encoder, decoder, and projector.

The main goal is to maximizes the information content of the embedding with the latent space through a joint embedding architecture.

Resulting in a **better reduced manifolds**

## 1. Initialization

Training set:  $\boldsymbol{\mu} = [\boldsymbol{\mu}^{(1)}, \boldsymbol{\mu}^{(2)}, \dots, \boldsymbol{\mu}^{(M-1)}, \boldsymbol{\mu}^{(M)}]$

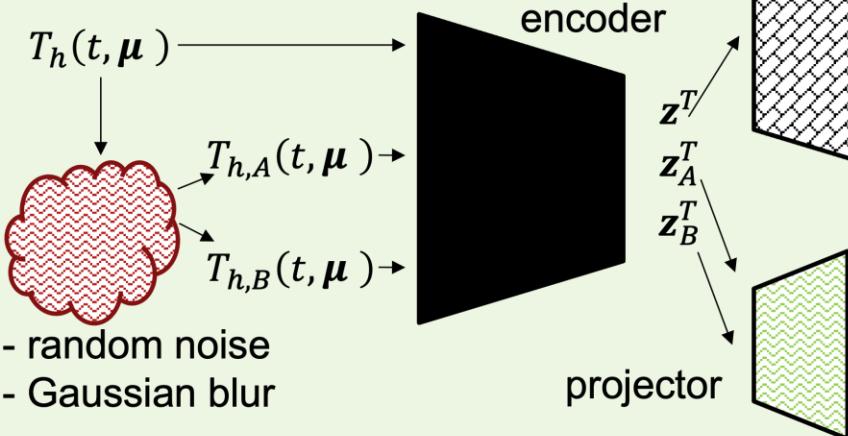

Validation set:  $\boldsymbol{\mu}_{\text{validation}} = \text{randomly select 10\% of } MN^t$

Testing set:  $\boldsymbol{\mu}_{\text{test}} = [\boldsymbol{\mu}_{\text{test}}^{(1)}, \boldsymbol{\mu}_{\text{test}}^{(2)}, \dots, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}}-1)}, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}})}]$

## 3. Training BT-AE

$N^t$  is total timestep

$$N^t = \sum_{i=1}^M N^{t(i)}(\boldsymbol{\mu}^{(i)})$$

## 2. Full order model (FOM)

$\mathbf{u}_h(\boldsymbol{\mu}^{(1)}), p_h(\boldsymbol{\mu}^{(1)}), T_h(\boldsymbol{\mu}^{(1)})$

FOM =

$\vdots$   
 $\mathbf{u}_h(\boldsymbol{\mu}^{(M)}), p_h(\boldsymbol{\mu}^{(M)}), T_h(\boldsymbol{\mu}^{(M)})$

Same goes for  $\boldsymbol{\mu}_v, \boldsymbol{\mu}_t$

Autoencoder loss or Data compression loss

$\widehat{T}_h(t, \boldsymbol{\mu}) \} \mathcal{L}_{\text{AE}}^T$

Barlow Twins loss

$\mathcal{L}_{\text{BT}}^T := \mathcal{L}_{\text{I}}^T + \mathcal{L}_{\text{RR}}^T$

Same goes for  $\widehat{\mathbf{u}}_h, \widehat{p}_h$

# Methodology

## 1. Initialization

Training set:  $\boldsymbol{\mu} = [\boldsymbol{\mu}^{(1)}, \boldsymbol{\mu}^{(2)}, \dots, \boldsymbol{\mu}^{(M-1)}, \boldsymbol{\mu}^{(M)}]$

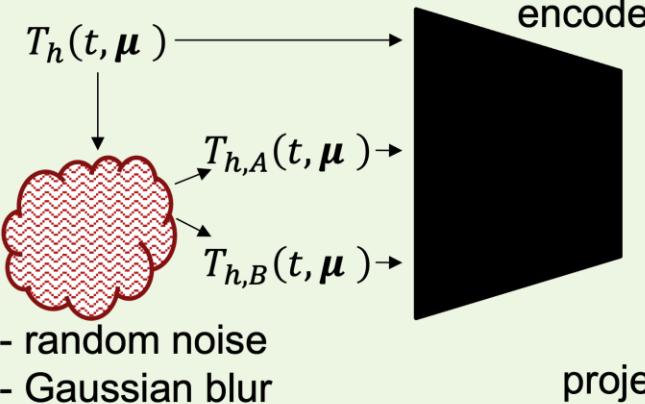

Validation set:  $\boldsymbol{\mu}_{\text{validation}} = \text{randomly select 10\% of } MN^t$

Testing set:  $\boldsymbol{\mu}_{\text{test}} = [\boldsymbol{\mu}_{\text{test}}^{(1)}, \boldsymbol{\mu}_{\text{test}}^{(2)}, \dots, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}}-1)}, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}})}]$

## 3. Training BT-AE

$N^t$  is total timestep

$$N^t = \sum_{i=1}^M N^{t(i)}(\boldsymbol{\mu}^{(i)})$$

## 2. Full order model (FOM)

$\mathbf{u}_h(\boldsymbol{\mu}^{(1)}), p_h(\boldsymbol{\mu}^{(1)}), T_h(\boldsymbol{\mu}^{(1)})$

FOM =

$\vdots$

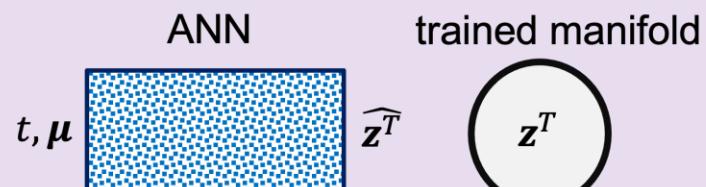

$\mathbf{u}_h(\boldsymbol{\mu}^{(M)}), p_h(\boldsymbol{\mu}^{(M)}), T_h(\boldsymbol{\mu}^{(M)})$

Same goes for  $\boldsymbol{\mu}_v, \boldsymbol{\mu}_t$

We then map our parameters to reduced manifolds using ANN.

\*We note that we could use other regressors such as GP or RBF.

## 4. Mapping (training ANN)

Same goes for  $\widehat{\mathbf{z}}^u, \widehat{\mathbf{z}}^p \quad \mathcal{L}_{\text{ANN}}$

# Methodology

## 1. Initialization

Training set:  $\boldsymbol{\mu} = [\boldsymbol{\mu}^{(1)}, \boldsymbol{\mu}^{(2)}, \dots, \boldsymbol{\mu}^{(M-1)}, \boldsymbol{\mu}^{(M)}]$

Validation set:  $\boldsymbol{\mu}_{\text{validation}} = \text{randomly select 10\% of } MN^t$

Testing set:  $\boldsymbol{\mu}_{\text{test}} = [\boldsymbol{\mu}_{\text{test}}^{(1)}, \boldsymbol{\mu}_{\text{test}}^{(2)}, \dots, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}}-1)}, \boldsymbol{\mu}_{\text{test}}^{(M_{\text{test}})}]$

## 2. Full order model (FOM)

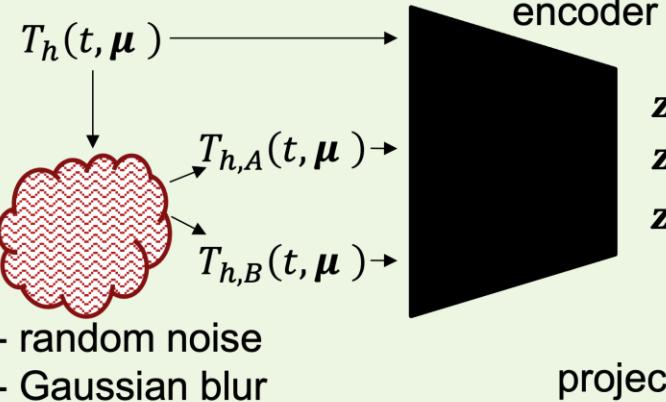

$\mathbf{u}_h(\boldsymbol{\mu}^{(1)}), p_h(\boldsymbol{\mu}^{(1)}), T_h(\boldsymbol{\mu}^{(1)})$    
 $\vdots$   
 $\mathbf{u}_h(\boldsymbol{\mu}^{(M)}), p_h(\boldsymbol{\mu}^{(M)}), T_h(\boldsymbol{\mu}^{(M)})$

Same goes for  $\boldsymbol{\mu}_v, \boldsymbol{\mu}_t$

## 3. Training BT-AE

$N^t$  is total timestep

$$N^t = \sum_{i=1}^M N^{t(i)}(\boldsymbol{\mu}^{(i)})$$

decoder

Autoencoder loss or  
Data compression loss

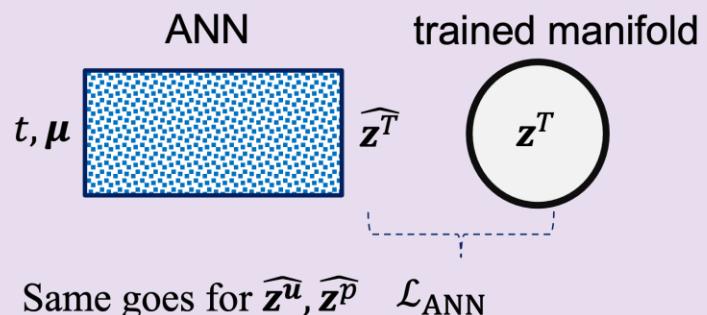

$$\widehat{T}_h(t, \boldsymbol{\mu}) \quad \mathcal{L}_{\text{AE}}^T$$

Barlow Twins loss

$$\mathcal{L}_{\text{BT}}^T := \mathcal{L}_{\text{I}}^T + \mathcal{L}_{\text{RR}}^T$$

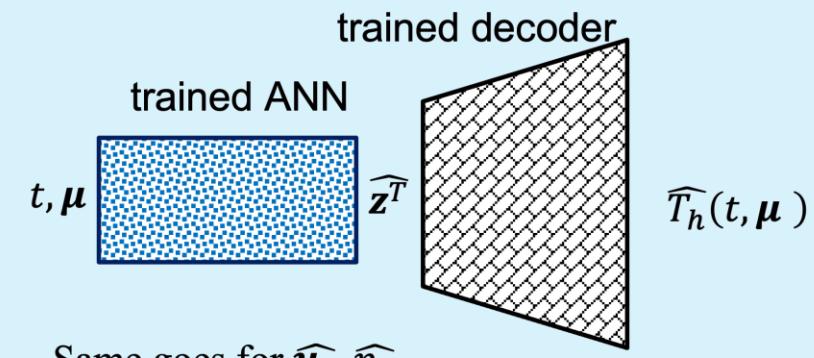

Same goes for  $\widehat{\mathbf{u}}_h, \widehat{p}_h$

## 4. Mapping (training ANN)

Same goes for  $\widehat{\mathbf{z}}^u, \widehat{\mathbf{z}}^p \quad \mathcal{L}_{\text{ANN}}$

## 5. Prediction (online phase)

Same goes for  $\widehat{\mathbf{u}}_h, \widehat{p}_h$

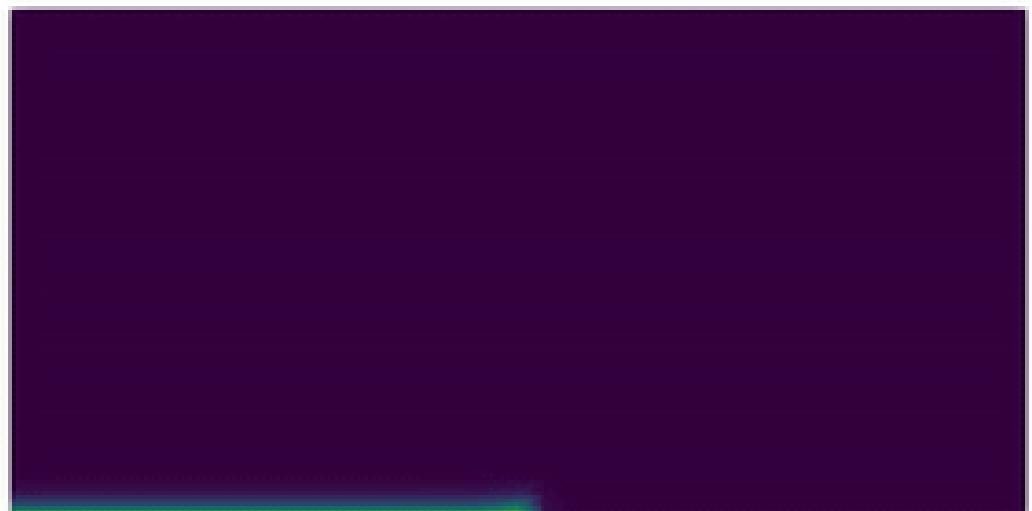

# Physical problems that we test

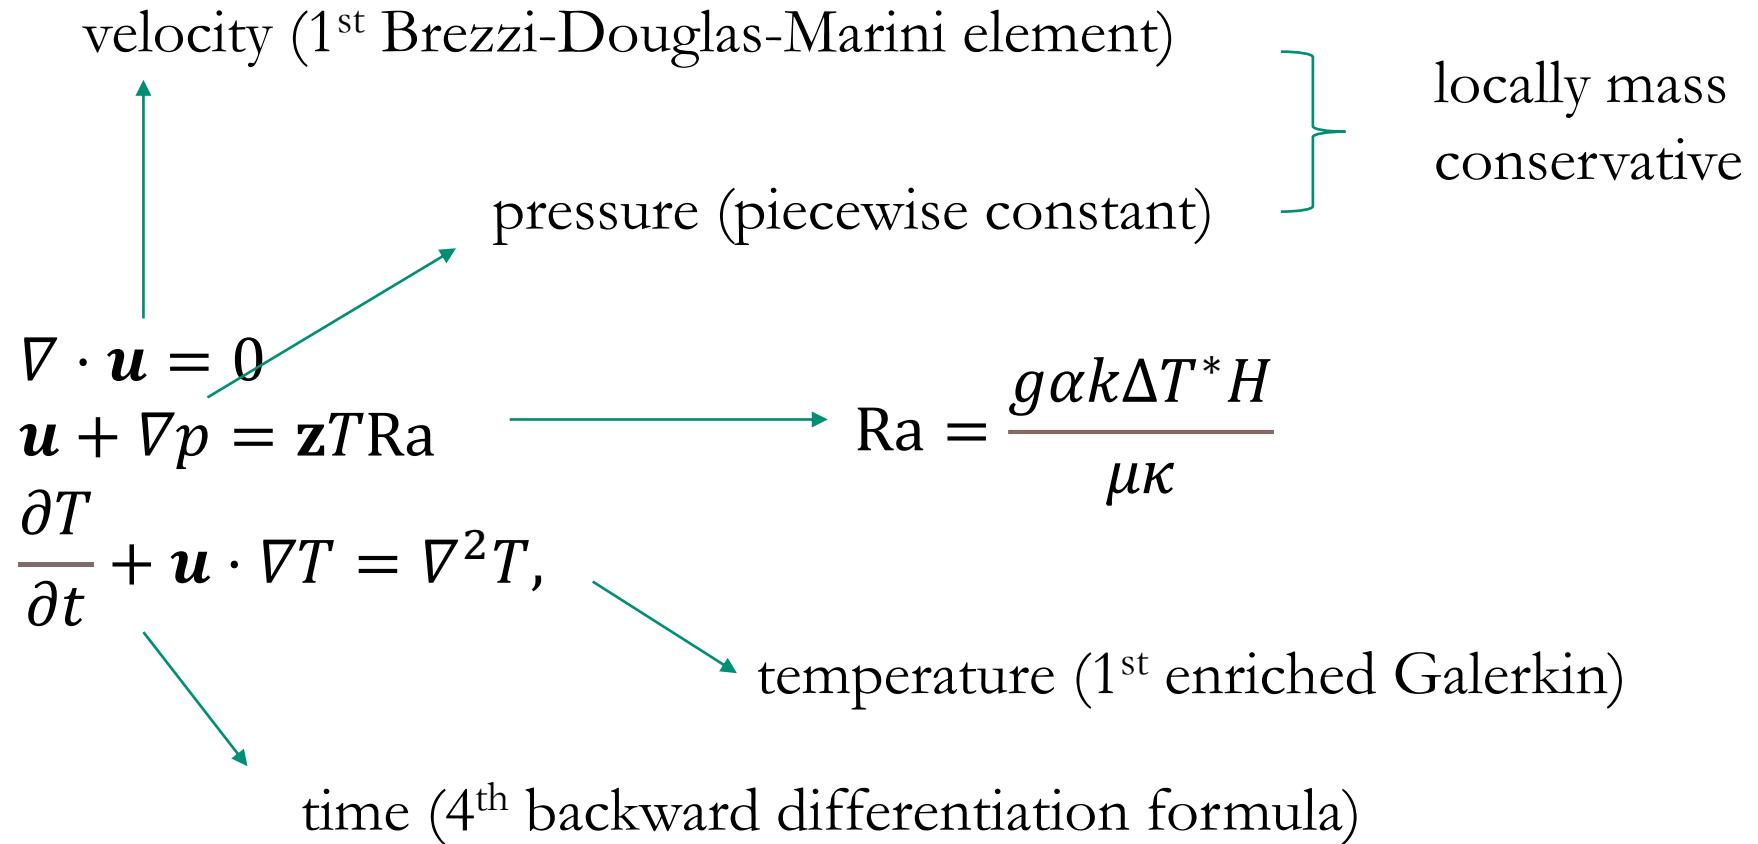

Fluid density is a function of its concentration and temperature, impacting fluid flow behavior

Examples: geothermal energy recovery, seawater intrusion, storage of nuclear and radioactive waste, contaminant transport among others.

Depending on system Rayleigh number and the formation heterogeneity, convective mixing can greatly accelerate CO<sub>2</sub> dissolution during geologic carbon storage.

# Physical problems that we test - continue

# Results – Heated from side (HFS)

1. We test our model using heated from side problem  
[Zhang et al. (2016, Comput. & Geosci)]

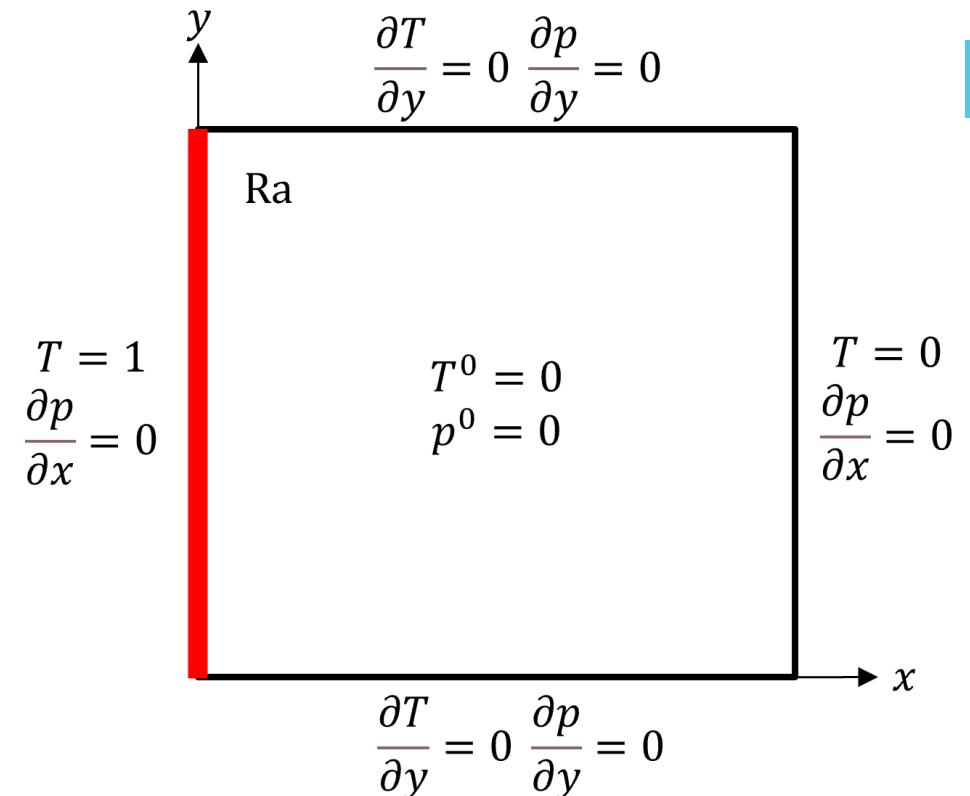

2. The flow is driven by the change of temperature on the left side

## Parameters

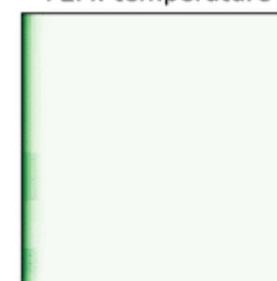

$$Ra_1 = [40, 80]$$

Training: 40

Testing: 10

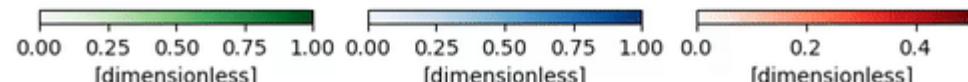

FEM: temperature

BT-AE: temperature

DIFF - BT-AE: temperature

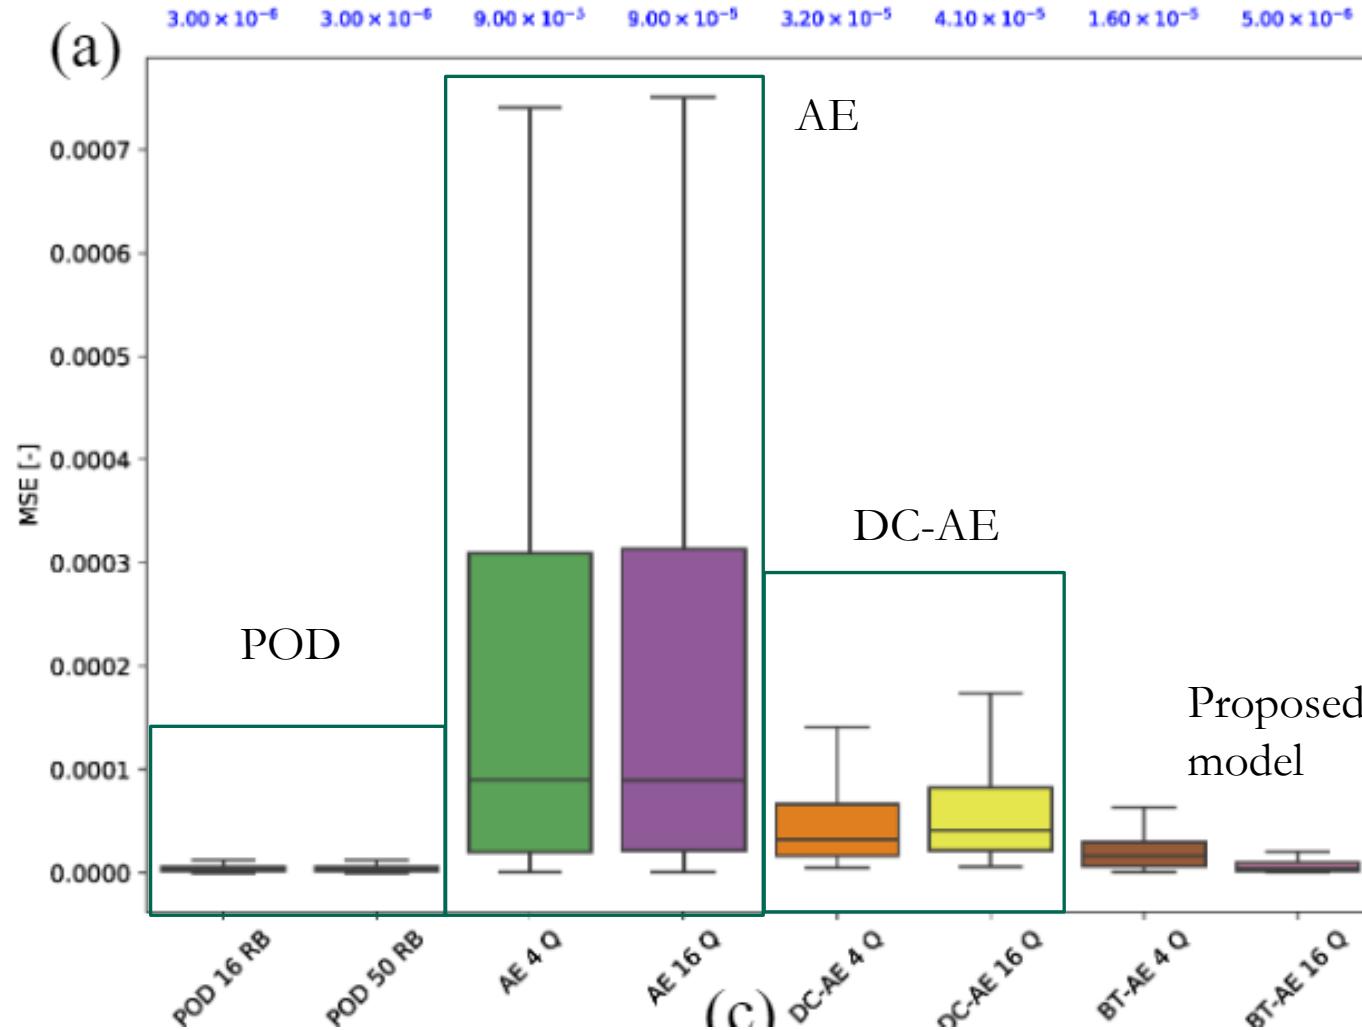

# Results – HFS - continue

15

1. We can see that BT model provide almost similar performance as POD model, but much better than AE and deep convolutional AE (i.e., problem lies within linear manifolds)

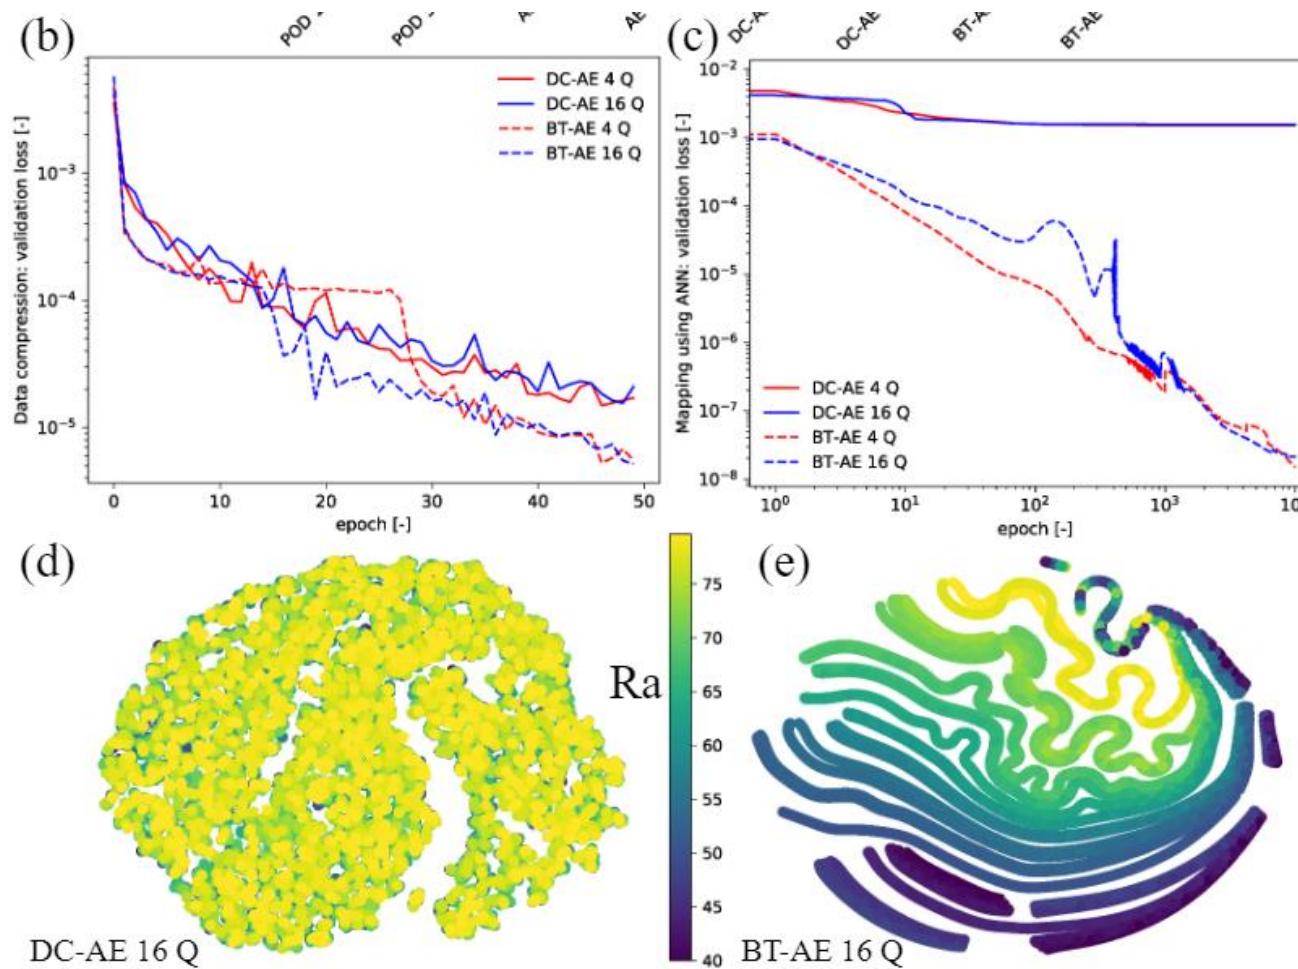

# Results – HFS - continue

16

1. We can see that the BT model (dashed) has a **lower data compression loss** (step 3), and it has a **much lower mapping loss** (step 4)

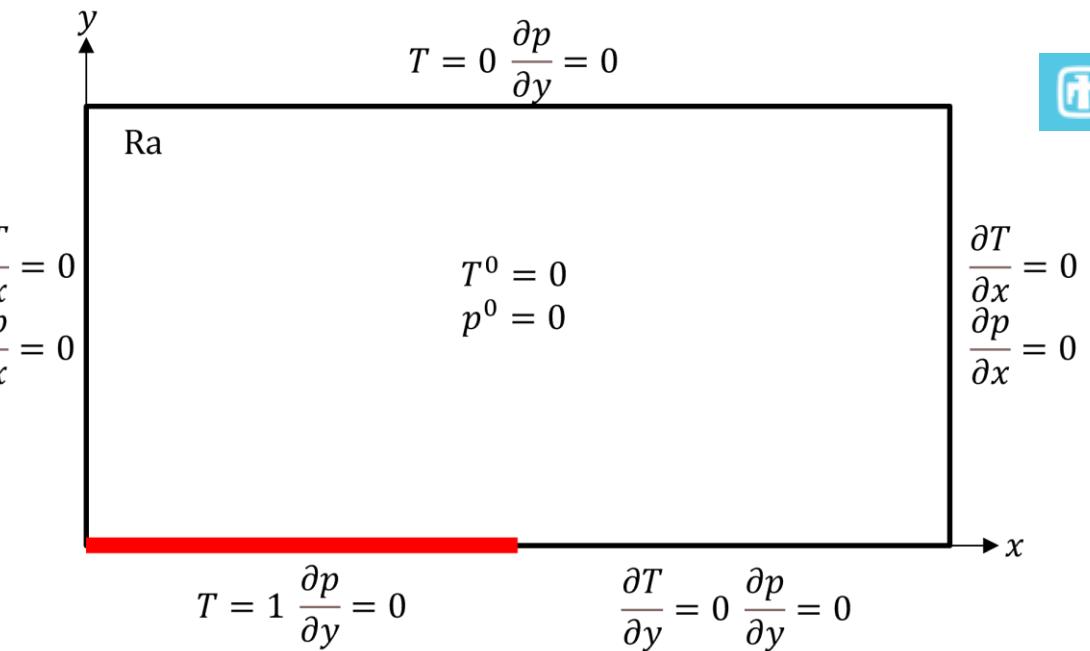

The nonlinear manifolds are not really well structure

The nonlinear manifolds are well structure

# Results - Elder

1. We test our model using Elder problem  
[Elder et al. (2017, Fluids)]

1. The flow is driven by the change of temperature at the bottom

## Parameters

$$\text{Ra}_1 = [350, 450]$$

Training: 40

Testing: 10

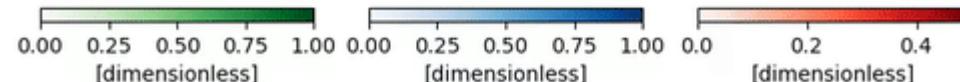

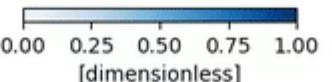

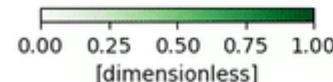

FEM: temperature

BT-AE: temperature

DIFF - BT-AE: temperature

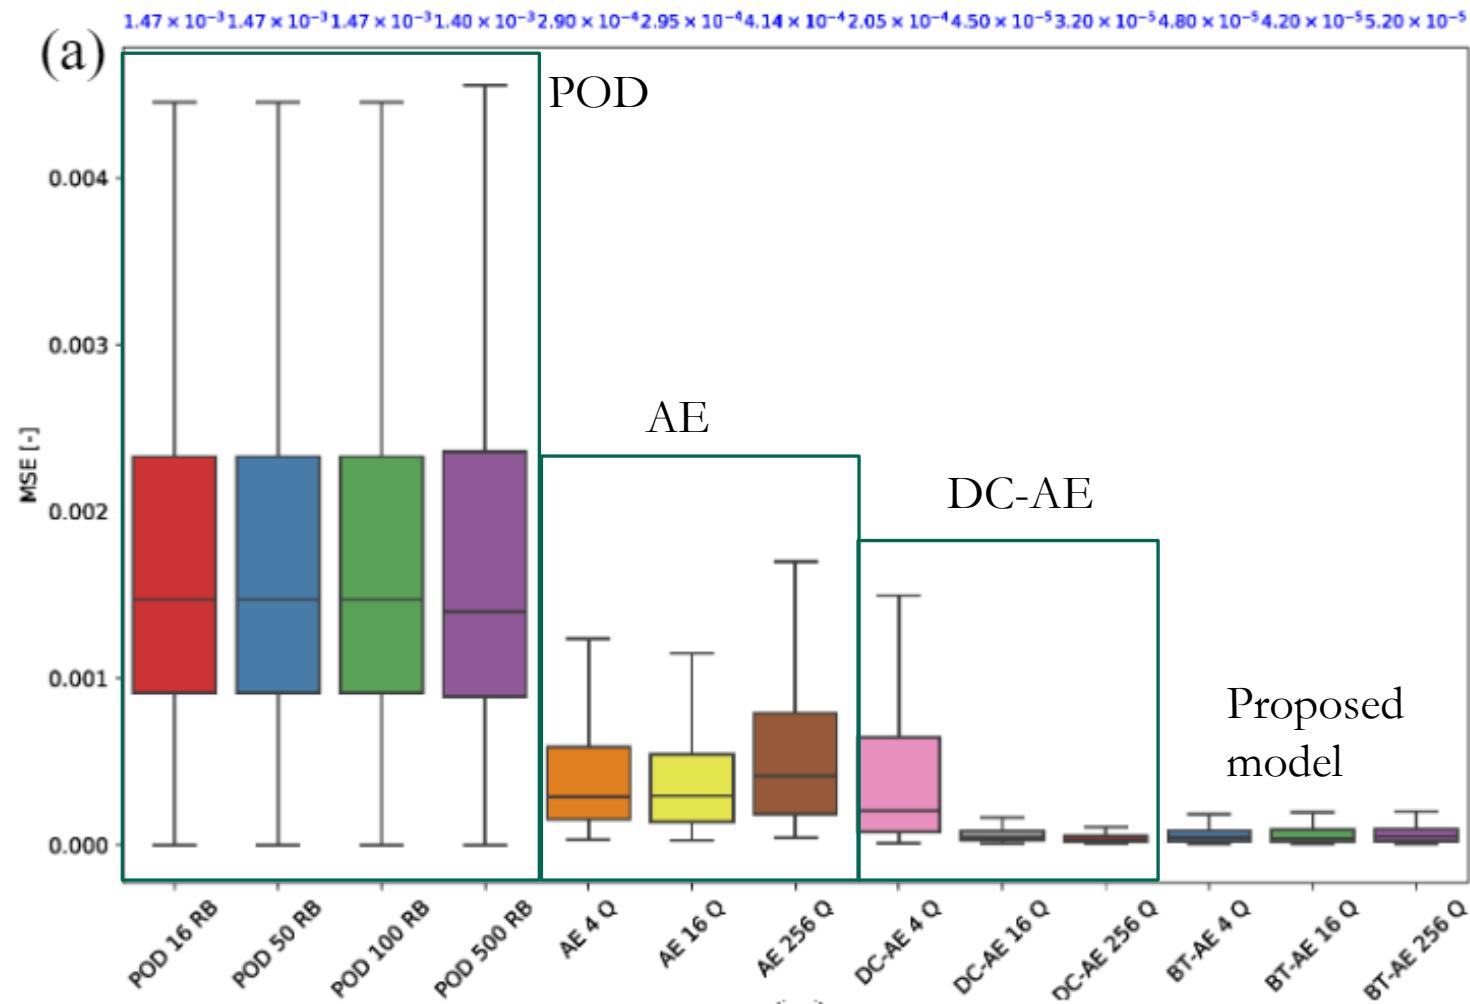

# Results – Elder - continue

18

1. We can see that BT model provide almost similar performance as deep convolutional AE (as well as be able to achieve a very good accuracy with only **4 nonlinear manifolds**)

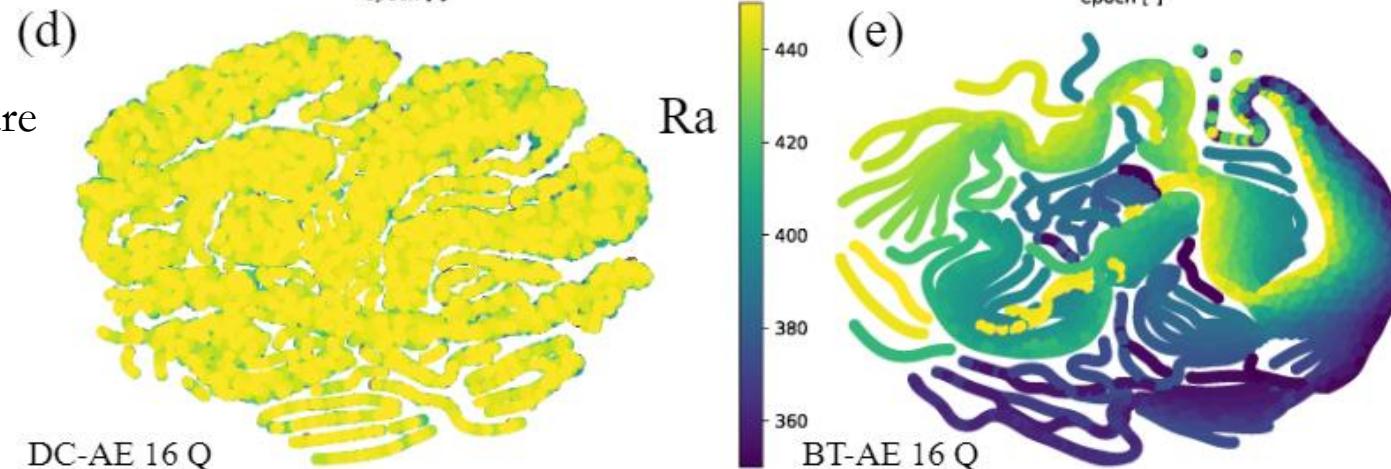

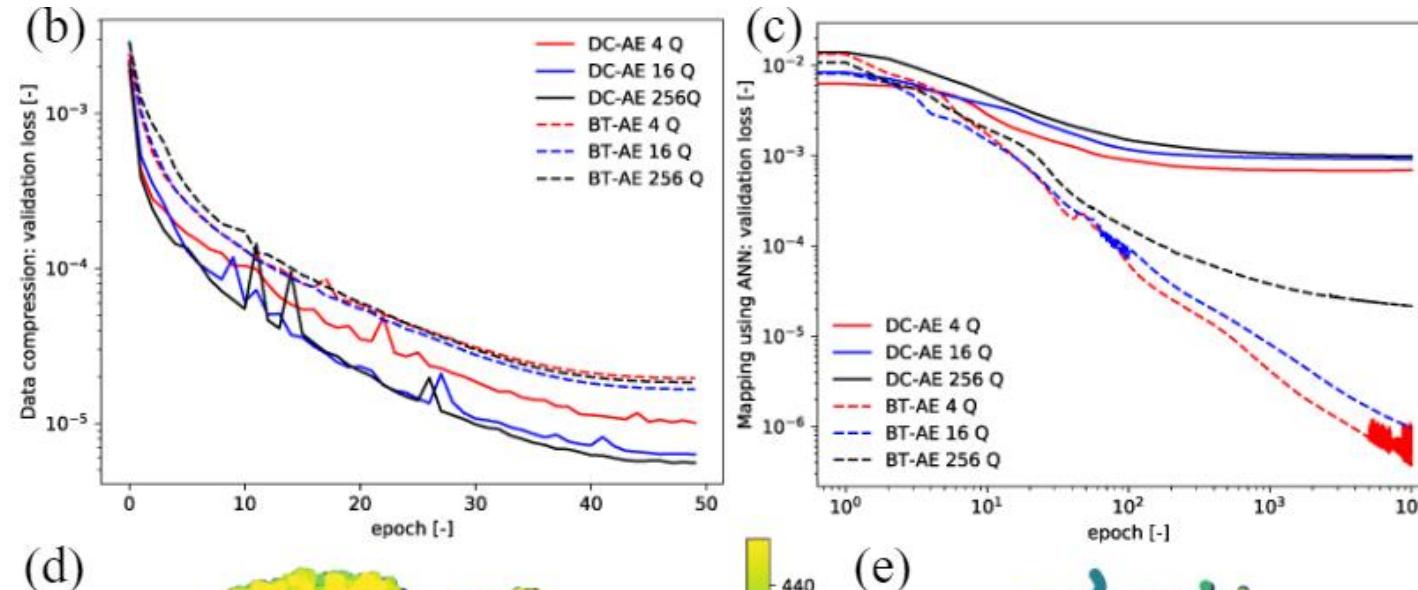

# Results – Elder - continue

19

1. We can see that the BT model (dashed) has a **higher data compression loss** (step 3), but it has a much **lower mapping loss** (step 4)

The nonlinear manifolds are not really well structure

The nonlinear manifolds are well structure

1. A ROM framework that works in an optimal way for both **linear** and **nonlinear** manifolds
2. A ROM framework that can be applied to both **structured** and **unstructured** meshes
3. Uncertainty-aware BT-ROM is in progress to achieve uncertainty quantification.
