Subsurface Hydrogen Assessment, Storage, and Technology Acceleration - Hydrogen Estimator for Logistical Planning (SHASTA-HELP) User's Manual

November 2023

Prepared for the U.S. Department of Energy, Office of Fossil Energy and Carbon Management by:

National Energy Technology Laboratory: Foad Haeri, Greg Lackey, Angela Goodman

Pacific Northwest National Laboratory: Nicolas Huerta, Joshua Wassing, Jennifer Fanning, Malcolm Moncheur De Rieudotte, Gerard M. Freeman

Sandia National Laboratories: Barry Roberts

Lawrence Livermore National Laboratory: Thomas A. Buscheck, Joshua A. White

Abstract

This user's manual describes version 1.0 of the SHASTA-HELP (Subsurface Hydrogen Assessment, Storage, and Technology Acceleration (SHASTA) - Hydrogen Estimator for Logistical Planning (HELP)) tool and provides instructions for use. The purpose of the SHASTA-HELP tool is to integrate the suite of tools developed by the SHASTA research team in a web-based framework for ease of access and more advanced, integrated analysis. This tool contains functionality for estimating the storage potential of pure and blended natural gas-hydrogen mixtures in various subsurface formations and is intended to be used for pre-characterization or site screening purposes. Detailed storage analysis should be conducted by full reservoir simulation models.

Acknowledgments

This work was supported by the U.S. Department of Energy, Office of Fossil Energy and Carbon Management through the Subsurface Hydrogen Assessment, Storage, and Technology Acceleration (SHASTA) project.

Portions of this research were executed through the NETL Research and Innovation Center's Carbon Storage Program. Research performed by Leidos Research Support Team staff was conducted under the RSS contract 89243318CFE000003.

Portions of this work were performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract DE-AC52-07-NA27344.

Portions of this work were performed under the auspices of the U.S. Department of Energy by Pacific Northwest National Laboratory under contract DE-AC05-76RL01830.

Portions of this work were performed under the auspices of the U.S. Department of Energy by Sandia National Laboratory under contract DE-NA0003525.

1.0 Introduction

SHASTA is a research collaboration between four U.S. Department of Energy (DOE) National Laboratories including the National Energy Technology Laboratory (NETL), Pacific Northwest National Laboratory (PNNL), Lawrence Livermore National Laboratory (LLNL), and Sandia National Laboratory (SNL), focused on determining the technical feasibility of hydrogen storage in subsurface systems and quantifying the associated operational risks. The purpose of the SHASTA-HELP tool is to integrate the suite of tools developed by the SHASTA research team in a web-based framework for ease of access and more advanced, integrated analysis.

SHASTA-HELP 1.0 contains functionality for estimating the storage potential of pure and blended natural gas-hydrogen mixtures in various subsurface formations including natural gas storage sites, depleted gas fields, saline aquifers, and salt caverns. The tool relies on a volumetric approach, accepts a variety of inputs, and is intended to be used for characterization or site screening purposes only. Detailed storage analysis should be conducted by full reservoir simulation models. More information on methods to estimate hydrogen storage can be found in these references: Lackey et al. (2023), Mouli-Castillo et al. (2021), Chen et al. (2023), and Lankof and Tarkowski (2020).

This edition of the user manual describes the storage potential functionality in SHASTA-HELP.

Future versions of SHASTA-HELP will include functionality to:

- Rapidly assess hydrogen storage and delivery (including transient evolution and steady-state operations) in a variety of reservoirs.
- Perform techno-economic analyses for the construction of new subsurface hydrogen storage facilities or the conversion of existing facilities.
- Characterize storage potential amidst geologic uncertainty and assess the sensitivity of storage volumes to uncertain parameters.
- Facilitate the sharing of public or SHASTA-generated datasets.
- Interact with spatial (i.e., map-based) displays of tool outputs.

2.0 Equations and Methods Used for Working Gas Energy Calculations for Existing U.S. Underground Storage Facilities

The working gas energy of hydrogen (H₂) that can be stored in existing U.S. underground gas storage (UGS) facilities, $WGE_{H_2,a}$, is calculated using Equation (1):

$$WGE_{H_2,a} = LHV_{H_2} \rho_{H_2,r} \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a} \quad (1)$$

where LHV_{H_2} is the lower heating value of H₂, $\rho_{H_2,r}$ is the density of H₂ in the storage reservoir at storage conditions when the reservoir is full, $\rho_{CH_4,a}$ is the density of methane (CH₄) at the ground surface conditions specified (101.56 kPa and 15.56 °C), $\rho_{CH_4,r}$ is the density of CH₄ in the storage reservoir at storage conditions when the reservoir is full, and $WGV_{CH_4,a}$ is the working gas volume of CH₄ reported at the ground surface conditions at 101.56 kPa and 15.56 °C.

The working gas volume of H₂, $WGV_{H_2,a}$ that can be stored in a UGS reservoir is calculated as:

$$WGV_{H_2,a} = \left(\frac{\rho_{H_2,r}}{\rho_{H_2,a}} \right) \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a}, \quad (2)$$

where $\rho_{H_2,a}$ is the density of hydrogen at 101.56 kPa and 15.56 °C.

The working gas energy of blended H₂-CH₄ mixtures, WGE_{mix} , is calculated using

$$WGE_{mix} = LHV_{H_2} \rho_{H_2,r} \left[VF_{H_2,r} \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a,mix} \right] + LHV_{CH_4} \rho_{CH_4,r} \left[VF_{CH_4,r} \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a,mix} \right], \quad (3)$$

where $VF_{H_2,r}$ is the volume fraction of H₂ in the mixture at storage conditions when the reservoir is full, $VF_{CH_4,r}$ is the volume fraction of CH₄ in the mixture at storage conditions when the reservoir is full, and LHV_{CH_4} is the lower heating value of CH₄. $VF_{H_2,r}$ was calculated using

$$VF_{H_2,r} = \frac{\frac{\rho_{H_2,a}}{\rho_{H_2,r}} VF_{H_2,a}}{\frac{\rho_{H_2,a}}{\rho_{H_2,r}} VF_{H_2,a} + \frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} VF_{CH_4,a}}, \quad (4)$$

where $VF_{H_2,a}$ is the volume fraction of H₂ in the mixture at the surface temperature and pressure (101.56 kPa and 15.56 °C), $VF_{CH_4,a}$ is the volume fraction of CH₄ in the mixture at surface conditions, $\rho_{H_2,a}$ is the density of H₂ at surface conditions, and $\rho_{CH_4,a}$ is the density of CH₄ at surface conditions. In Equation (3),

$VF_{CH_4,r} = 1 - VF_{H_2,r}$. The working gas volumes of H₂, $WGV_{H_2,mix}$, and CH₄, $WGV_{CH_4,mix}$, in blended H₂-CH₄ mixtures were calculated with their respective density ratio:

$$WGV_{H_2,mix} = \left(\frac{\rho_{H_2,r}}{\rho_{H_2,a}} \right) VF_{H_2,r} \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a} \quad (5)$$

$$WGV_{CH_4,mix} = VF_{CH_4,r} \left(\frac{\rho_{CH_4,a}}{\rho_{CH_4,r}} \right) WGV_{CH_4,a}. \quad (6)$$

Table F1 in Appendix F provides definitions for all terms described in Equations (1)–(6). An application of this method and equations to assess existing natural storage reservoirs across the United States to estimate the amount of H₂ that could be potentially stored underground, either as a pure gas or mixed with natural gas, can be found in Lackey et al. (2023).

3.0 Initiating SHASTA-HELP

The web-based version of the tool can be accessed here: <https://shasta-help.pnnl.gov>. There is also a downloadable version of the tool that is publicly available on GitHub and can be found here: https://github.com/netl-ric/wgv_calculation. More details about the downloadable version of the tool are included in Appendix G.

Figure 3.1 shows the main page of the SHASTA-HELP web-based tool. The “Map” tab at the top is still under development. Under the “Calculation” tab at the top, there are two main options:

- AN EXISTING NATURAL GAS STORAGE FACILITY
 - Appropriate for all natural gas storage facilities with a known working gas volume regardless of reservoir type.
- A PROSPECTIVE GEOLOGIC FORMATION
 - Appropriate for a geologic formation (depleted gas field, saline aquifer, or salt cavern) with unknown working gas volume.

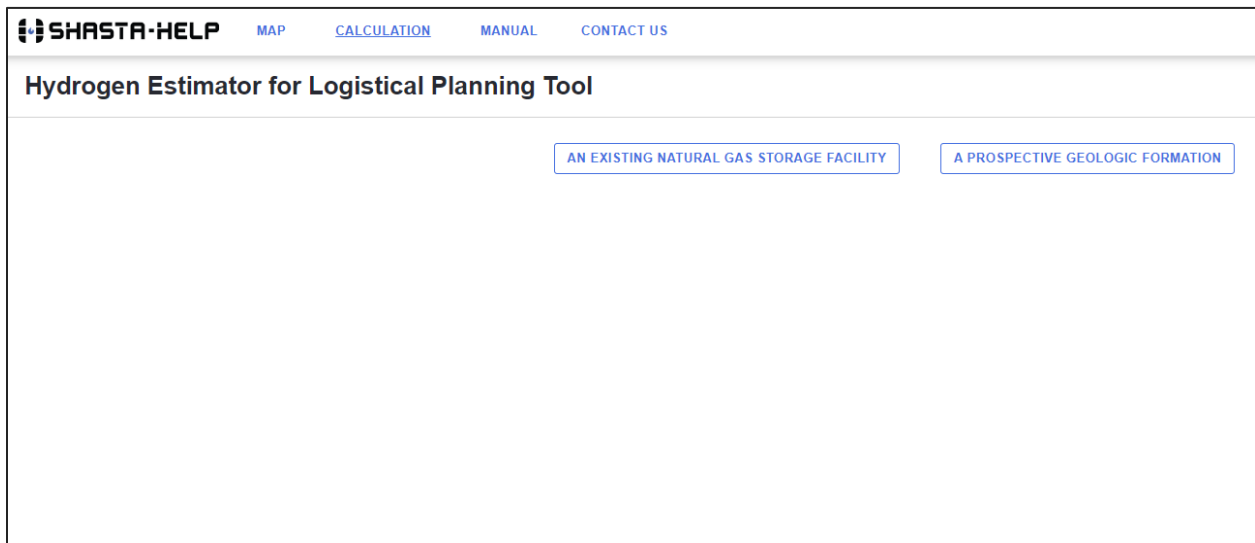

Figure 3.1: The main page (Calculation tab) of SHASTA-HELP web-based tool.

4.0 Running the Tool

AN EXISTING NATURAL GAS STORAGE FACILITY:

If “An Existing Natural Gas Storage Facility” is selected on the main page, a new page will be displayed as shown in Figure 4.1. You can always go back to the main page by clicking on “BACK TO STORAGE TYPE SELECTION” button. The “Units” radio button provides the option to enter the input values and generate the results in either SI or Imperial units. Switching the radio button will change the units of both input and output values. Input parameters on the left-side of the page are auto populated with default values; however, the user is encouraged to modify these values. The definitions of parameters are included in the page at the bottom right. Once input parameters are finalized with default or modified values (all entries must contain a value), press the “RUN CALCULATION” button and the results will appear at the top right of the page. The results include the working gas mass, working gas volume, and working gas energy of hydrogen, methane, and total blend. To test new input parameters, simply modify the parameters and press “RUN CALCULATION” again. For convenience, the results can be exported by clicking on the “EXPORT TO CSV” button under the results table. Also, under the results table, the output values can be set to be displayed in scientific or standard notation with varying precision.

Natural Gas Storage Facility
Appropriate for all natural gas storage facilities with a known working gas volume regardless of reservoir type.

Definitions of Parameters

Input Parameters
 Pressure: Reservoir pressure (Kilopascal or psi)
 Temperature: Reservoir temperature (Kelvin or Fahrenheit)
 Reported Working Gas Volume: The working gas volume reported for an existing natural gas storage site (Cubic Meter or Thousand Cubic Feet)
 Hydrogen Fraction: Fraction of hydrogen in gas mixture at surface conditions (0 ≤ Fraction ≤ 1)

Results
 Working Gas Mass: Total mass of gas stored that can be injected or withdrawn from the reservoir (Million Tonnes or Tonnes)
 Working Gas Volume: Total volume of gas stored that can be injected or withdrawn from the reservoir (Billion Cubic Meter or Million Cubic Feet)
 Working Gas Energy: Total energy of gas stored that can be injected or withdrawn from the reservoir (Terajoule or Terawatt-hour)

Figure 4.1: “Natural Gas Storage Facility” page of SHASTA-HELP web-based tool.

A PROSPECTIVE GEOLOGIC FORMATION:

If “A Prospective Geologic Formation” is selected on the main page, three options will appear as shown in Figure 4.2:

- DEPLETED GAS FIELD
- SALINE AQUIFER
- SALT CAVERN

Each type of formation is associated with different set of input parameters and calculations.

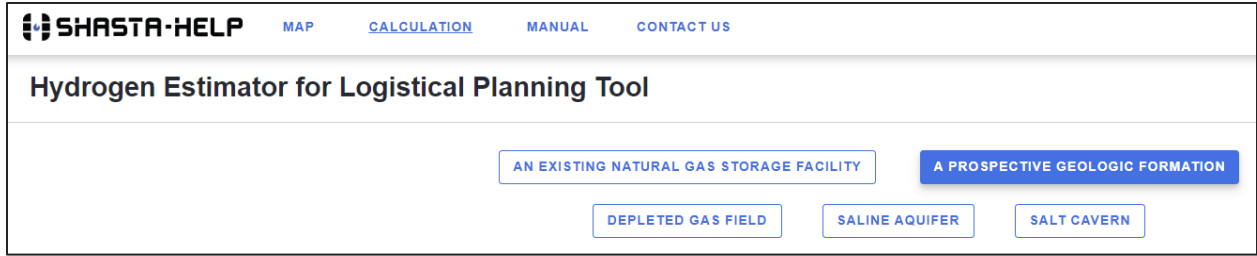

Figure 4.2: Geologic formation options under “A Prospective Geologic Formation” category.

DEPLETED GAS FIELD

If “Depleted Gas Field” is selected under “A Prospective Geologic Formation,” two more options will appear as shown in Figure 4.3, based on whether the cumulative gas production is available or not:

- KNOWN CUMULATIVE GAS PRODUCTION
- UNKNOWN CUMULATIVE GAS PRODUCTION

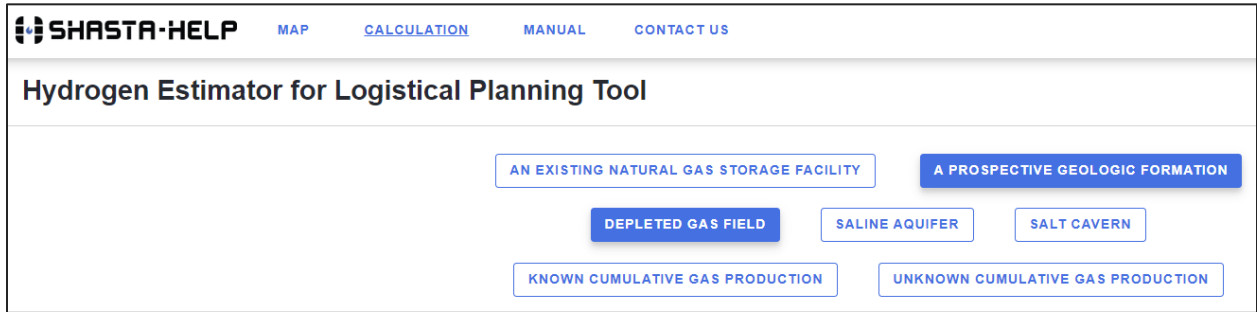

Figure 4.3: Options under “Depleted Gas Field” category, based on availability of cumulative gas production.

KNOWN CUMULATIVE GAS PRODUCTION

If “Known Cumulative Gas Production” is selected under “Depleted Gas Field,” a new page will be displayed as shown in Figure 4.4 for calculations related to depleted gas fields, when cumulative gas production is known. The functionality of the unit radio button, input parameters, run button, and results table are as described before.

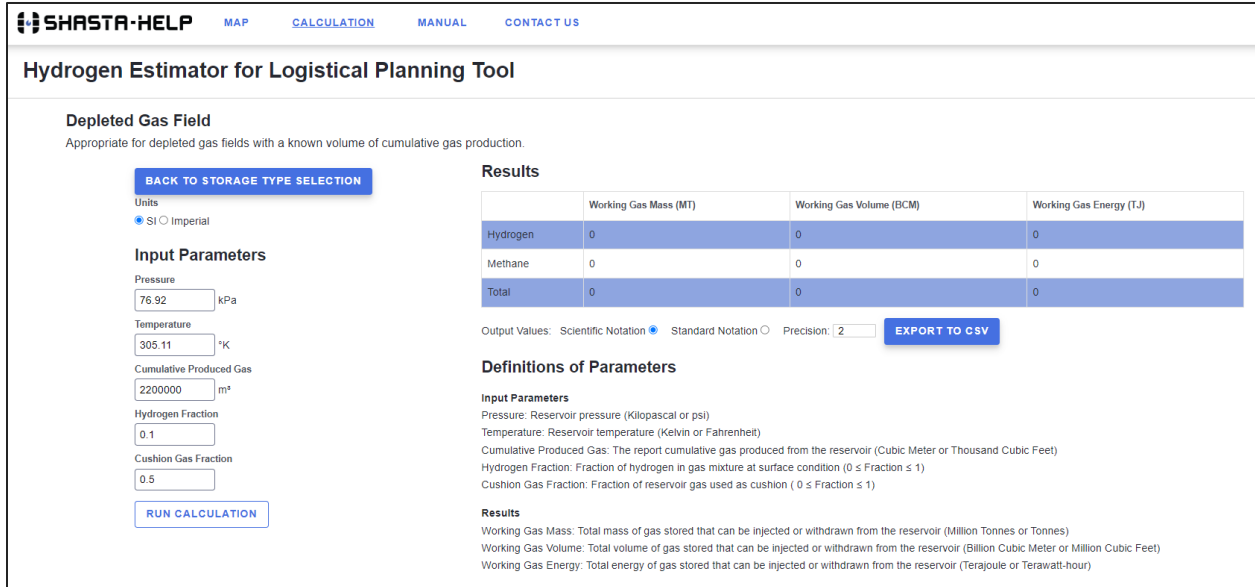

Figure 4.4: “Depleted Gas Field” page of SHASTA-HELP web-based tool when the cumulative gas production is known.

UNKNOWN CUMULATIVE GAS PRODUCTION

If “Unknown Cumulative Gas Production” is selected under “Depleted Gas Field,” a new page will be displayed as shown in Figure 4.5 for calculations related to depleted gas fields, when cumulative gas production is unknown. The functionality of the unit radio button, input parameters, run button, and results table are as described before.

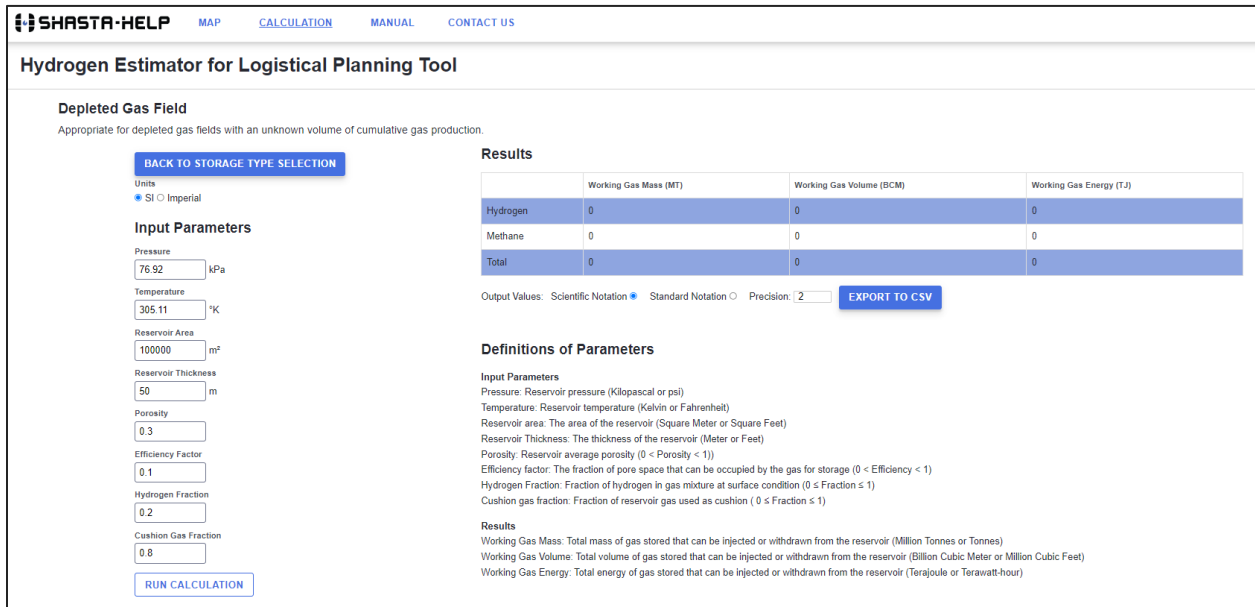

Figure 4.5: “Depleted Gas Field” page of SHASTA-HELP web-based tool when the cumulative gas production is unknown.

SALINE AQUIFER

If “Saline Aquifer” is selected from the “Prospective Geologic Formation” category on the main page (as shown in Figure 4.6), a new page will be displayed as shown in Figure 4.7 for calculations related to saline aquifers. The functionality of the unit radio button, input parameters, run button, and results table are as described before.

Figure 4.6: Selecting the “Saline Aquifer” option from “A Prospective Geologic Formation” category on the main page.

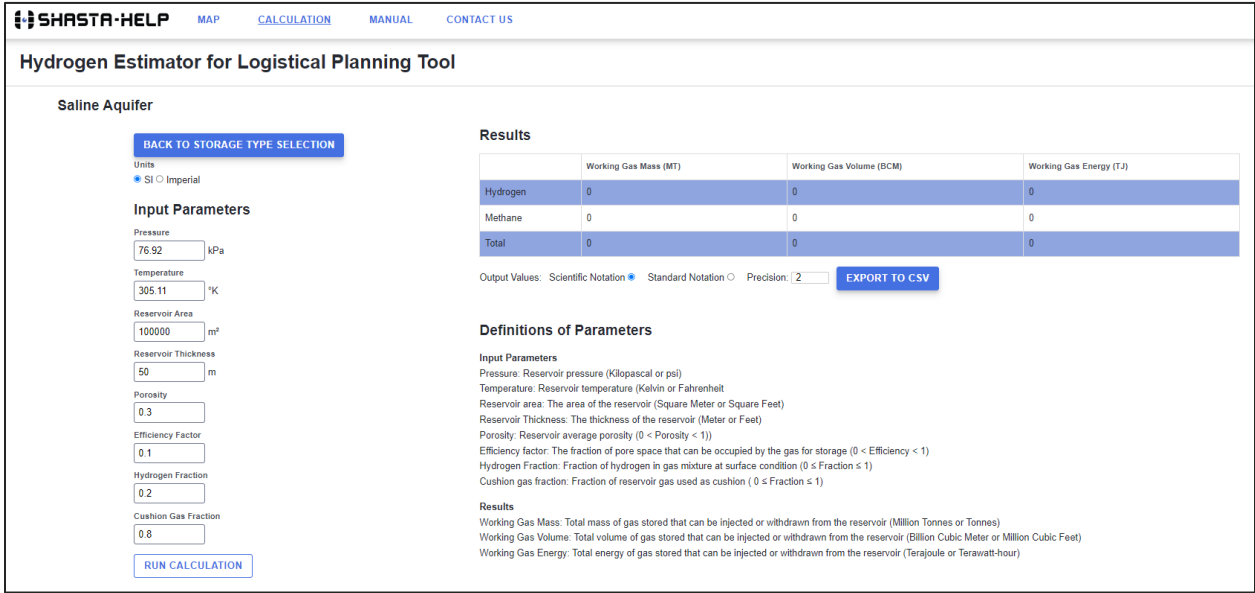

Figure 4.7: “Saline Aquifer” page of SHASTA-HELP web-based tool.

SALT CAVERN

If "Salt Cavern" is selected from the "Prospective Geologic Formation" category on the main page (as shown in Figure 4.8), a new page will be displayed for calculations related to salt caverns.

Figure 4.8: Selecting "Salt Cavern" option from "A Prospective Geologic Formation" category on the main page.

These calculations can be performed for either a "Single cavern with specified information" or "Multiple equally sized caverns in a formation." An additional radio button is provided under "Input Parameters" to switch between these two modes. Figure 4.9 shows the page for calculations related to a single cavern (default mode of the radio button) and Figure 4.10 shows the page for calculations related to multiple caverns. The functionality of the unit radio button, input parameters, run button, and results table are as described before.

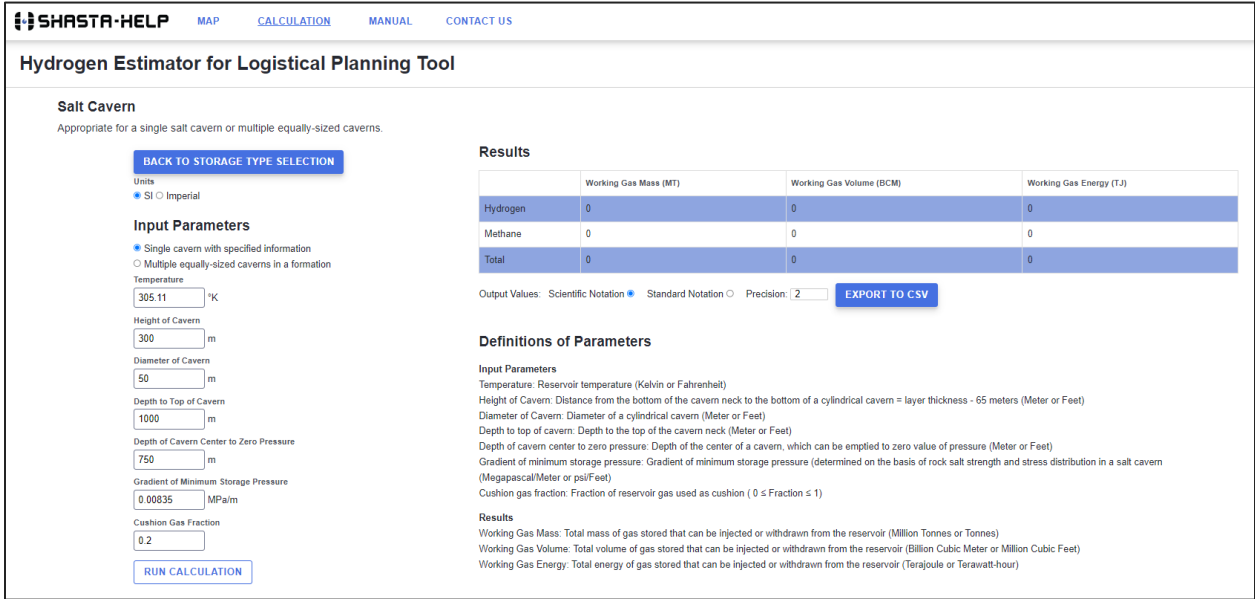

Figure 4.9: "Salt Cavern (single)" page of SHASTA-HELP web-based tool.

Definitions of Parameters

Input Parameters

Temperature: Reservoir temperature (Kelvin or Fahrenheit)

Formation thickness: The thickness of the formation (Meter or Feet)

Formation area: The area of the formation (Hectare or Acre)

Depth to top of cavern: Depth to the top of the cavern neck (Meter or Feet)

Depth of cavern center to zero pressure: Depth of the center of a cavern, which can be emptied to zero value of pressure (Meter or Feet)

Gradient of minimum storage pressure: Gradient of minimum storage pressure (determined on the basis of rock salt strength and stress distribution in a salt cavern) (Megapascal/Meter or psi/Feet)

Cushion gas fraction: Fraction of reservoir gas used as cushion ($0 \leq \text{Fraction} \leq 1$)

Results

Working Gas Mass: Total mass of gas stored that can be injected or withdrawn from the reservoir (Million Tonnes or Tonnes)

Working Gas Volume: Total volume of gas stored that can be injected or withdrawn from the reservoir (Billion Cubic Meter or Million Cubic Feet)

Working Gas Energy: Total energy of gas stored that can be injected or withdrawn from the reservoir (Terajoule or Terawatt-hour)

Figure 4.10: “Salt Cavern (multiple)” page of SHASTA-HELP web-based tool.

The step-by-step calculations used in the tool are provided in Appendices A–E for natural gas storage facilities, depleted gas fields, saline aquifers, and salt caverns. More details about the methodology can be found in Lackey et al. (2023).

Temperature: T_res

Reported working gas volume: wgv_in

Hydrogen fraction: H2_frac_stp

Surface temperature and pressure

P_stp = 1 bar

T_stp = 273.15 K

Heating value of H₂ and CH₄

lhv_H2 = 3.332e-8 Twh/kg

lhv_CH4 = 1.389e-8 Twh/kg

Fraction of CH₄ in gas

CH4_frac_stp = 1 - H2_frac_stp

Density of H₂ and CH₄ at surface and reservoir conditions

rho_H2_stp: estimated at P_stp and T_stp using Peng-Robinson equation of state

rho_CH4_stp: estimated at P_stp and T_stp using Peng-Robinson equation of state

rho_H2_res: estimated at P_res and T_res using Peng-Robinson equation of state

rho_CH4_res: estimated at P_res and T_res using Peng-Robinson equation of state

H₂ and CH₄ fraction in gas at reservoir conditions

if H2_frac_stp = 1 then:

H2_frac_res = H2_frac_stp

CH4_frac_res = CH4_frac_stp

If H2_frac_stp ≠ 1 then:

$H2_frac_res = ((rho_H2_stp / rho_H2_res) * H2_frac_stp) /$

$$\left(\left(\frac{\rho_{H2_stp}}{\rho_{H2_res}} * H2_frac_stp \right) + \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} * CH4_frac_stp \right) \right)$$

$$CH4_frac_res = 1 - H2_frac_res$$

Calculate working gas mass (wgm) results

$$wgm_H2 = \rho_{H2_res} * H2_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wgm_CH4 = \rho_{CH4_res} * CH4_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wgm_total = wgm_H2 + wgm_CH4$$

Calculate working gas energy (wge) results

$$wge_H2 = lhv_H2 * \rho_{H2_res} * H2_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wge_CH4 = lhv_CH4 * \rho_{CH4_res} * CH4_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wge_total = wge_H2 + wge_CH4$$

Calculate working gas volume (wgv) results

$$wgv_H2 = \left(\frac{\rho_{H2_res}}{\rho_{H2_stp}} \right) * H2_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wgv_CH4 = \left(\frac{\rho_{CH4_res}}{\rho_{CH4_stp}} \right) * CH4_frac_res * \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} \right) * wgv_in$$

$$wgv = wgv_H2 + wgv_CH4$$

Appendix B: Calculation Steps for Depleted Gas Fields

Input parameters

Pressure: P_{res}

Temperature: T_{res}

Cumulative produced gas: V_{res}

Hydrogen fraction: $H2_{frac_stp}$

Cushion gas fraction: cg_frac

Surface temperature and pressure

$P_{stp} = 1 \text{ bar}$

$T_{stp} = 273.15 \text{ K}$

Heating value of H_2 and CH_4

$lhv_{H2} = 3.332e-8 \text{ Twh/kg}$

$lhv_{CH4} = 1.389e-8 \text{ Twh/kg}$

Fraction of CH_4 in gas

$CH4_{frac_stp} = 1 - H2_{frac_stp}$

Density of H_2 and CH_4 at surface and reservoir conditions

ρ_{H2_stp} : estimated at P_{stp} and T_{stp} using Peng-Robinson equation of state

ρ_{CH4_stp} : estimated at P_{stp} and T_{stp} using Peng-Robinson equation of state

ρ_{H2_res} : estimated at P_{res} and T_{res} using Peng-Robinson equation of state

ρ_{CH4_res} : estimated at P_{res} and T_{res} using Peng-Robinson equation of state

H_2 and CH_4 fraction in gas at reservoir conditions

if $H2_{frac_stp} = 1$ then:

$$H2_{frac_res} = H2_{frac_stp}$$

$$CH4_{frac_res} = CH4_{frac_stp}$$

If $H2_{frac_stp} \neq 1$ then:

$$H2_{frac_res} = ((\rho_{H2_stp} / \rho_{H2_res}) * H2_{frac_stp}) /$$

$$\left(\left(\frac{\rho_{H2_stp}}{\rho_{H2_res}} * H2_frac_stp \right) + \left(\frac{\rho_{CH4_stp}}{\rho_{CH4_res}} * CH4_frac_stp \right) \right)$$

$$CH4_frac_res = 1 - H2_frac_res$$

Calculate working gas mass (wgm) results

$$wgm_H2 = (\rho_{H2_res} * H2_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac))$$

$$wgm_CH4 = (\rho_{CH4_res} * CH4_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac))$$

$$wgm_total = wgm_H2 + wgm_CH4$$

Calculate working gas energy (wge) results

$$wge_H2 = lhv_H2 * \rho_{H2_res} * H2_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac)$$

$$wge_CH4 = lhv_CH4 * \rho_{CH4_res} * CH4_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac)$$

$$wge_total = wge_H2 + wge_CH4$$

Calculate working gas volume (wgv) results

$$wgv_H2 = (\rho_{H2_res} / \rho_{H2_stp}) * H2_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac)$$

$$wgv_CH4 = (\rho_{CH4_res} / \rho_{CH4_stp}) * CH4_frac_res * (\rho_{CH4_stp} / \rho_{CH4_res}) * V_res * (1 - cg_frac)$$

$$wgv = wgv_H2 + wgv_CH4$$

$P_{stp} = 1 \text{ bar}$

$T_{stp} = 273.15 \text{ K}$

Heating value of H_2 and CH_4

$lhv_{H2} = 3.332e-8 \text{ Twh/kg}$

$lhv_{CH4} = 1.389e-8 \text{ Twh/kg}$

Fraction of CH_4 in gas

$CH4_{frac_stp} = 1 - H2_{frac_stp}$

Density of H_2 and CH_4 at surface and reservoir conditions

ρ_{H2_stp} : estimated at P_{stp} and T_{stp} using Peng-Robinson equation of state

ρ_{CH4_stp} : estimated at P_{stp} and T_{stp} using Peng-Robinson equation of state

ρ_{H2_res} : estimated at P_{res} and T_{res} using Peng-Robinson equation of state

ρ_{CH4_res} : estimated at P_{res} and T_{res} using Peng-Robinson equation of state

H_2 and CH_4 fraction in gas at reservoir conditions

if $H2_{frac_stp} = 1$ then:

$$H2_{frac_res} = H2_{frac_stp}$$

$$\text{CH4_frac_res} = \text{CH4_frac_stp}$$

If $\text{H2_frac_stp} \neq 1$ then:

$$\text{H2_frac_res} = ((\text{rho_H2_stp} / \text{rho_H2_res}) * \text{H2_frac_stp}) /$$

$$(((\text{rho_H2_stp} / \text{rho_H2_res}) * \text{H2_frac_stp}) + ((\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{CH4_frac_stp}))$$

$$\text{CH4_frac_res} = 1 - \text{H2_frac_res}$$

Calculate working gas mass (wgm) results

$$\text{wgm_H2} = (\text{rho_H2_res} * \text{H2_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac}))$$

$$\text{wgm_CH4} = (\text{rho_CH4_res} * \text{CH4_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac}))$$

$$\text{wgm_total} = \text{wgm_H2} + \text{wgm_CH4}$$

Calculate working gas energy (wge) results

$$\text{wge_H2} = \text{lhv_H2} * \text{rho_H2_res} * \text{H2_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac})$$

$$\text{wge_CH4} = \text{lhv_CH4} * \text{rho_CH4_res} * \text{CH4_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac})$$

Calculate working gas volume (wgv) results

$$\text{wgv_H2} = (\text{rho_H2_res} / \text{rho_H2_stp}) * \text{H2_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac})$$

$$\text{wgv_CH4} = (\text{rho_CH4_res} / \text{rho_CH4_stp}) * \text{CH4_frac_res} * (\text{rho_CH4_stp} / \text{rho_CH4_res}) * \text{A_res} * \text{H_res} * \text{phi_res} * \text{ef} * (1 - \text{cg_frac})$$

$$\text{wgv} = \text{wgv_H2} + \text{wgv_CH4}$$

Appendix D: Calculation Steps for Salt Caverns (Single Cavern, Pure Hydrogen)

Input parameters

Temperature: T_{res}

Height of cavern: H_{cav}

Diameter of cavern: D_{cav}

Depth to top of cavern: h_n

Depth of cavern center to zero pressure: h_o

Gradient of minimum storage pressure: g_{min}

Cushion gas fraction: cg_{frac}

Fracture gradient

$g_f = 0.016 \text{ Mpa/m}$

H₂ gas constant and density

$R_{h2} = 4121.73 \text{ KJ/kg K}$ (universal gas constant/H₂ molar mass)

$\rho_{h2_n} = 0.089 \text{ kg/m}^3$ (at surface conditions: could be entered by user)

Depth to center of cavern

$h_c = h_n + 15 + H_{cav}/2$

Volume of cavern

$V_{cav} = (\pi/12) * (D_{cav}^2) * (3 * H_{cav} - D_{cav})$

Maximum pressure

$P_{max} = g_f * h_n$

Minimum pressure

$P_{min} = g_{min} * (h_c - h_o)$

Maximum and minimum compressibility factors

Z_{max} : estimated at P_{max} and T_{res} using Peng-Robinson equation of state

Z_{min} : estimated at P_{min} and T_{res} using Peng-Robinson equation of state

Maximum and minimum mass stored

$$M_{\text{max}} = (1 - \text{cg_frac}) * ((P_{\text{max}} * V_{\text{cav}}) / R_{\text{h2}} * T_{\text{res}} * Z_{\text{max}})$$

$$M_{\text{min}} = (1 - \text{cg_frac}) * ((P_{\text{min}} * V_{\text{cav}}) / R_{\text{h2}} * T_{\text{res}} * Z_{\text{min}})$$

Working gas mass

$$\text{wgm} = M_{\text{max}} - M_{\text{min}}$$

Working gas energy

$$\text{wge} = \text{wgm} * \text{lhv_H2}$$

Working gas volume

$$\text{wgv} = (\text{wgm} / \text{rho_h2_n})$$

Appendix E: Calculation Steps for Salt Caverns (Multiple Caverns, Pure Hydrogen)

Input parameters

Temperature: T_{res}

Formation thickness: F_{thick} (must be greater than 65 m)

Formation area: F_{area} (must be greater than $16 * [2 * (F_{thick} - 65) / 3]^2$)

Depth to top of cavern: h_n

Depth of cavern center to zero pressure: h_o

Gradient of minimum storage pressure: g_{min}

Cushion gas fraction: cg_{frac}

Fracture gradient

$g_f = 0.016$ Mpa/m

H₂ gas constant and density

$R_{h2} = 4121.73$ KJ/kg K (universal gas constant/H₂ molar mass)

$\rho_{h2_n} = 0.089$ kg/m³ (at surface conditions: could be entered by user)

Cavern density in space

$cav_{den} = 0.0000185$ caverns/m^{**2} (1 cavern/5.4 hectare) - Lankof and Tarkowski (2020)

Depth to center of cavern

$h_c = h_n + 15 + H_{cav} / 2$

Volume of cavern

$V_{cav} = (\pi / 12) * (D_{cav}^2) * (3 * H_{cav} - D_{cav})$

Maximum pressure

$P_{max} = g_f * h_n$

Minimum pressure

$P_{min} = g_{min} * (h_c - h_o)$

Maximum and minimum compressibility factors

Z_max: estimated at P_max and T_res using Peng-Robinson equation of state

Z_min: estimated at P_min and T_res using Peng-Robinson equation of state

Maximum and minimum mass stored

$$M_{\max} = (1 - cg_frac) * ((P_{\max} * V_{\text{cav}}) / R_{\text{h2}} * T_{\text{res}} * Z_{\max})$$

$$M_{\min} = (1 - cg_frac) * ((P_{\min} * V_{\text{cav}}) / R_{\text{h2}} * T_{\text{res}} * Z_{\min})$$

Working gas mass per cavern

$$wgm_pc = M_{\max} - M_{\min}$$

Working gas energy

$$wge = wgm_pc * lhv_H2$$

Working gas volume

$$wgv = (wgm_pc / rho_{\text{h2_n}}) * 0.00003531 \text{ (m3 to MMcf)}$$

Number of caverns in formation

$$n_cav = F_area * cav_den$$

Total mass, energy, and for formation

$$wgm = wgm_pc * n_cav$$

$$wge = wge_pc * n_cav$$

$$wgv = wgv_pc * n_cav$$

Appendix F: Definitions of Parameters Used to Calculate the Working Gas Energy of H₂ Storage

Table F.1: Description of Parameters used in Equations (1) to (6).

Parameter	Unit	Description
WGE_{H_2}	TWh	Working gas energy of H ₂ at the ground surface conditions at 101.56 kPa and 15.56 °C
WGE_{mix}	TWh	Working gas energy of blended H ₂ -CH ₄ mixtures at the ground surface conditions at 101.56 kPa and 15.56 °C
LHV_{H_2}	$\frac{kWh}{kg}$	Lower heating value of H ₂ (120 MJ/kg)
LHV_{CH_4}	$\frac{kWh}{kg}$	Lower heating value of CH ₄ (50 MJ/kg)
$\rho_{H_2,r}$	$\frac{kg}{m^3}$	Density of H ₂ in the storage reservoir at storage conditions when the reservoir is full
$\rho_{H_2,a}$	$\frac{kg}{m^3}$	Density of H ₂ at the ground surface conditions (101.56 kPa and 15.56 °C)
$\rho_{H_2,STP}$	$\frac{kg}{m^3}$	Density of H ₂ at standard temperature and pressure (STP) at 100 kPa and 0 °C
$\rho_{CH_4,r}$	$\frac{kg}{m^3}$	Density of CH ₄ in the storage reservoir at storage conditions when the reservoir is full
$\rho_{CH_4,a}$	$\frac{kg}{m^3}$	Density of CH ₄ at the ground surface conditions (101.56 kPa and 15.56 °C)
$\rho_{CH_4,STP}$	$\frac{kg}{m^3}$	Density of CH ₄ at standard temperature and pressure (STP) at 100 kPa and 0 °C
$VF_{H_2,r}$	<i>fraction</i>	Volume fraction of H ₂ in the mixture at storage conditions when the reservoir is full
$VF_{CH_4,r}$	<i>fraction</i>	Volume fraction of CH ₄ in the mixture at storage conditions when the reservoir is full
$VF_{H_2,STP}$	<i>fraction</i>	Volume fraction of H ₂ in the mixture at standard temperature and pressure (STP) at 100 kPa and 0 °C
$VF_{CH_4,STP}$	<i>fraction</i>	Volume fraction of CH ₄ in the mixture at standard temperature and pressure (STP) at 100 kPa and 0 °C
$WGV_{H_2,a}$	m^3	Working gas volume of H ₂ at the ground surface conditions at 101.56 kPa and 15.56 °C
$WGV_{CH_4,a}$	m^3	Working gas volume of CH ₄ at the ground surface conditions in the EIA dataset at 101.56 kPa and 15.56 °C
$WGV_{H_2,mix}$	m^3	Working gas volume of blended H ₂ at the ground surface conditions at 101.56 kPa and 15.56 °C
$WGV_{CH_4,mix}$	m^3	Working gas volume of blended CH ₄ at the ground surface conditions in the EIA dataset at 101.56 kPa and 15.56 °C

Appendix G: Running The Downloadable Version of the SHASTA-HELP Tool

The downloadable version of the SHASTA-HELP tool is publicly available on GitHub and can be found here: https://github.com/netl-ric/wgv_calculation. This version is coded in the Python computer programming language. The tool can be imported as a Python module or interacted with through the built-in Graphical User Interface (GUI).

Figure G.1 shows the screenshot of the GitHub repository. The Python libraries required to run the tool are as follow:

- python = 3.7.6
- numpy = 1.20.3
- scipy = 1.7.3
- PIL = 7.0.0
- tkinter = 8.6.8

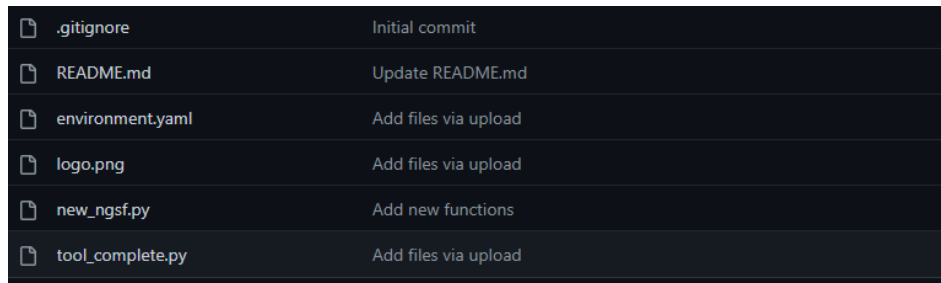

Figure G.1: Screenshot of the downloadable version of SHASTA-HELP tool on GitHub.

GETTING STARTED

To use the downloadable version, after running the file “tool_complete.py,” the GUI splash page will appear as shown in Figure G.2. The first step is to select a formation by clicking on “Select a formation” and choosing the target formation from the dropdown.

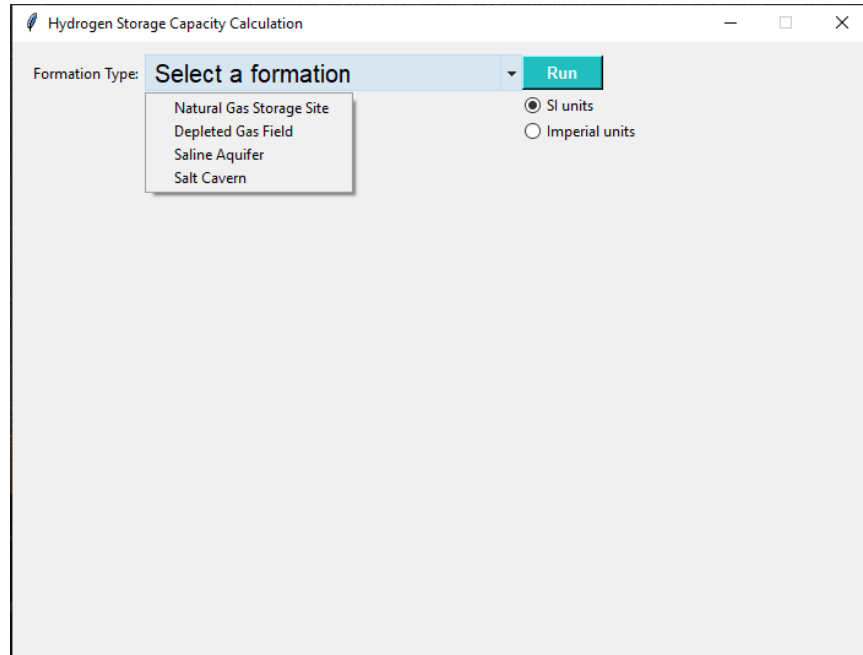

Figure G.2: Screenshot of the SHASTA-HELP tool GUI splash page, including a dropdown to select formation.

INPUT PARAMETERS

The dropdown for target formation has four options, including:

- Natural Gas Storage Site
- Depleted Gas Field
- Saline Aquifer
- Salt Cavern

By selecting any of the options in the dropdown, a list of input parameters and their respective default values will appear as shown in Figures G.3–G.7. To switch the unit, use the radio button under the green “Run” button at the top of the window. Every time you change the unit, a prompt message will appear notifying you that the unit is changing, and you will have to start over by selecting the formation again. When you select a formation, input parameters will have default values with the new selected unit. The default values are provided to give some hints to the user. Values can always be modified to new values entered by the user. Note that for salt cavern calculations only pure hydrogen is considered in this version of the tool. When salt cavern is selected as the target formation, a radio button appears to provide the choice between “Single cavern with specified information” (Figure G.6) or “Multiple equally-sized caverns in a formation” (Figure G.7), for each of which specific input parameters will be listed.

Hydrogen Storage Capacity Calculation

Formation Type: **Natural Gas Storage Site**

SI units
 Imperial units

Input Parameters:

Pressure: KPa

Temperature: K

Reported working gas volume: m³

Hydrogen fraction:

Figure G.3: Screenshot of the SHASTA-HELP tool GUI – Input Parameters for Natural Gas Storage Site.

Hydrogen Storage Capacity Calculation

Formation Type: **Depleted Gas Field**

SI units
 Imperial units

Input Parameters:

Pressure: KPa

Temperature: K

Cumulative produced gas: m³

Hydrogen fraction:

Cushion gas fraction:

Figure G.4: Screenshot of the SHASTA-HELP tool GUI – Input Parameters for Depleted Gas Field.

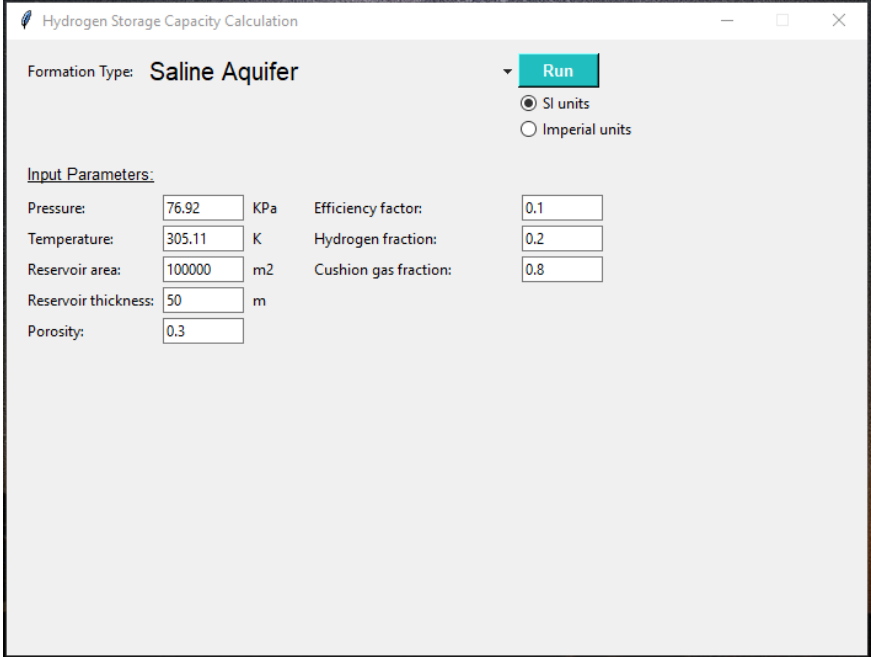

Figure G.5: Screenshot of the SHASTA-HELP tool GUI – Input Parameters for Saline Aquifer.

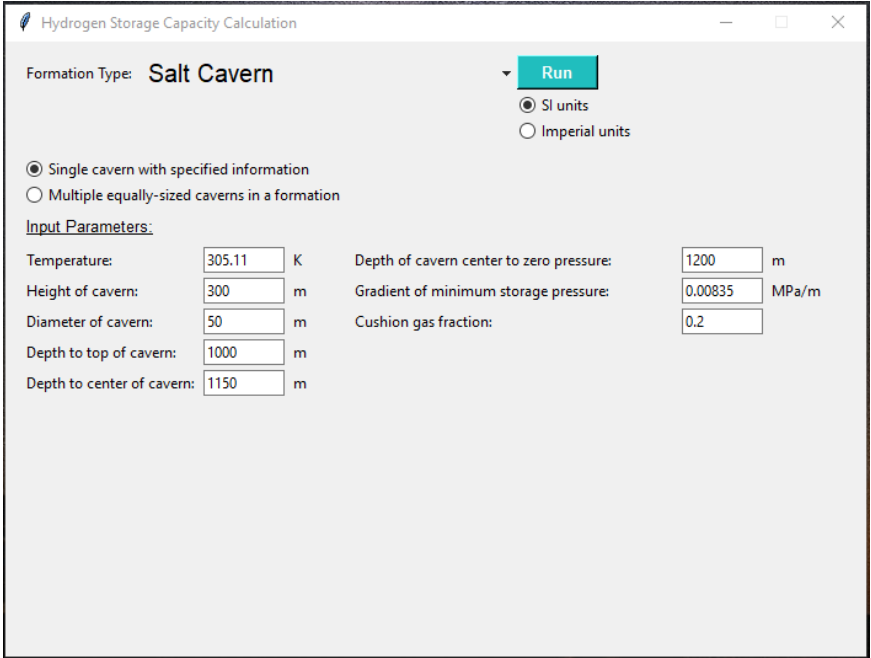

Figure G.6: Screenshot of the SHASTA-HELP tool GUI – Input Parameters for Salt Cavern (single).

Hydrogen Storage Capacity Calculation

Formation Type: **Salt Cavern** Run

SI units
 Imperial units

Single cavern with specified information
 Multiple equally-sized caverns in a formation

Input Parameters:

Temperature:	<input type="text" value="305.11"/>	K	Depth of cavern center to zero pressure:	<input type="text" value="1200"/>	m
Formation thickness:	<input type="text" value="500"/>	m	Gradient of minimum storage pressure:	<input type="text" value="0.00835"/>	MPa/m
Formation area:	<input type="text" value="180"/>	ha	Cushion gas fraction:	<input type="text" value="0.2"/>	
Depth to top of cavern:	<input type="text" value="1000"/>	m			
Depth to center of cavern:	<input type="text" value="1150"/>	m			

Figure G.7: Screenshot of the SHASTA-HELP tool GUI – Input Parameters for Salt Cavern (multiple).

RESULTS

Once input parameters are finalized with default or modified values (all entries must contain a value), press the green “Run” button at the top of the window (Figure G.8). When the calculations are completed, the results will appear at the bottom of the window. The results include the working gas mass, working gas volume, and working gas energy of hydrogen, methane, and total blend.

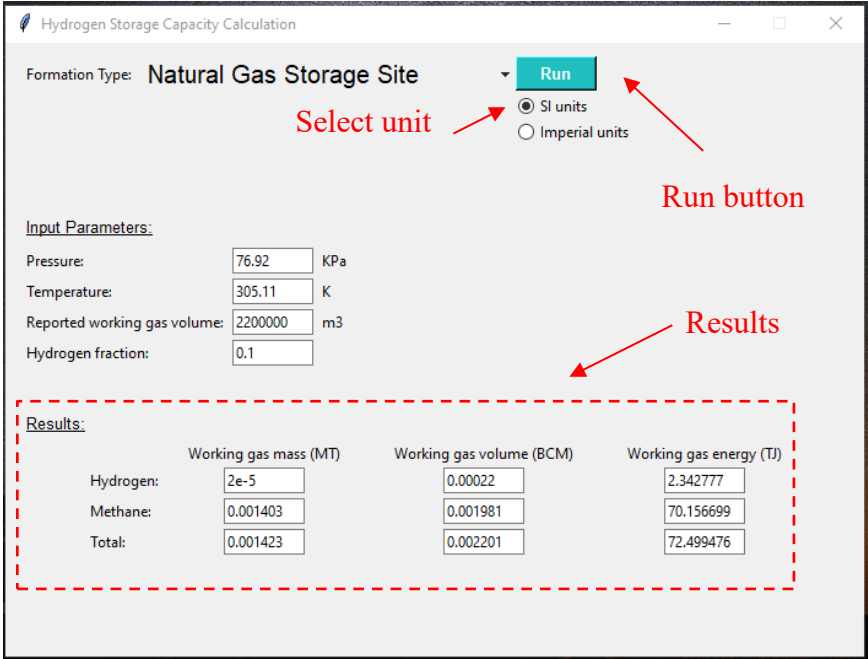

Figure G.8: Screenshot of the SHASTA-HELP tool GUI – The Unit, “Run” button, and Results.
