

# Towards Deterministic Defect Center Fabrication Using Sandia's Focused Ion Implantation Capabilities

E. Bielejec

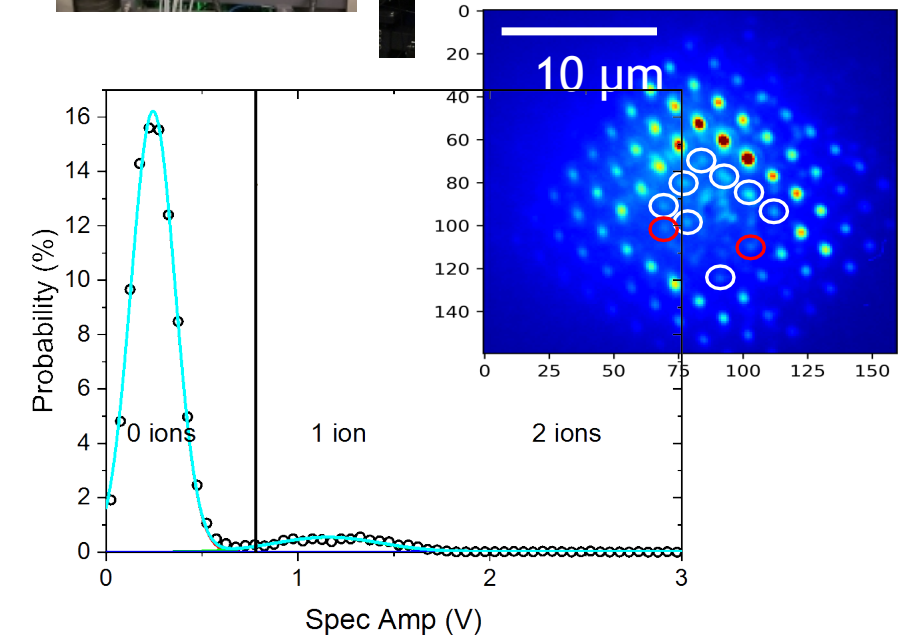

Sandia National Laboratories, Albuquerque, NM 87185

## Outline

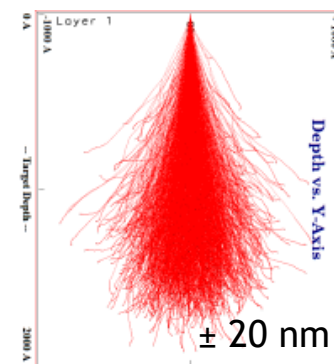

- Introduction to Focused Ion Beam Capabilities at Sandia's Ion Beam Laboratory (IBL)
- Multi-species Focused Ion Beam (FIB)
  - Sandia's nanoImplanter and Raith Velion
  - New Liquid Metal Alloy Ion Source Development
- Single Defect Centers in Wide Bandgap Substrates
  - In-situ Counting - control the # of implanted ions
  - In-situ Photoluminescence - verify defect centers
- Summary and Outlook for FIB Implantation

# Nanofabrication using Focused Ion Beam (FIB) Implantation

SRIM simulation - XY straggle  
200 keV Si into diamond

**Depth**  $\propto$  Energy + Z Straggle

SRIM simulation - Z straggle  
200 keV Si into diamond  
 $131 \pm 26$  nm

- (1) 6 MV Tandem Accelerator
- (2) 3 MV Pelletron Accelerator
- (3) 1 MV Tandem Accelerator
- (4) 350 kV HVEE Implanter
- (5) 100 kV ExB FIB nanoImplanter
- (6) 35 kV ExB FIB Raith Velion
- (7) 35 kV Zeiss HelM

Low energy  
focused  
nanobeams  
<1 to 20 nm

## (8) 35 kV Plasma FIB

25 end-stations including *in-situ* DLTS, PL, TEM, SEM, 1200°C heating, etc...

# High Energy Focused Ion Beams $\sim 1 \mu\text{m}$

- 6 MV Tandem microbeam (microONE)

- High resolution laser stage
- Spot size  $< 1 \mu\text{m}$
- Energy 0.8 - 70 MeV
- H to Au

NV PL in diamond

- 3 MV Pelletron microbeam (Light Ion Microbeam)

- High resolution laser stage
- Spot size  $< 600 \text{ nm}$
- Energy 0.25 - 3 MeV
- H, He, N, Ar, Xe, ...

IBIC on PIN diode

- 350 kV HVEE microbeam (NanoBeamLine)

- Piezo stage
- Spot size  $< 1 \mu\text{m}$
- Energy 20 - 350 keV
- H to Au

Ni into diamond

# Low Energy Focused Ion Beams <1 to 20 nm

- 100 kV A&D FIB100NI (nanolimplanter)

- High resolution laser stage
- Spot size <10 nm (Ga)
- Energy 10 - 200 keV
- 1/3 periodic table

- 35 kV Raith Velion (Velion)

- High resolution laser stage
- Spot size <6 nm (Ga)
- Energy 5 - 70 keV
- 1/3 periodic table

- 35 kV Zeiss Orion Plus (HeIM)

- Piezo stage
- Spot size <1 nm
- Energy 10 - 35 keV
- He

*All three equipped with Raith lithography software for patterning*

# FIB Implantation Resolution

## What our resolution?

### High Energy FIB

- Spot Size  $\sim 1 \mu\text{m}$
- Alignment accuracy  $\sim 1 \mu\text{m}$
- Overall resolution  $\sim 1\text{-}2 \mu\text{m}$

### Low Energy FIB

- Spot Size  $\sim$  few nm
- Alignment accuracy  $\sim 10\text{'s nm}$
- Overall resolution  $\sim 20\text{-}50 \text{ nm}$

## What is the needed resolution?

Silicon quantum processor with robust long-distance qubit couplings

Guilherme Tosi<sup>1</sup>, Fahd A. Mohiyaddin<sup>1,3</sup>, Vivien Schmitt<sup>1</sup>, Stefanie Tenberg<sup>1</sup>, Rajib Rahman<sup>2</sup>, Gerhard Klimeck<sup>2</sup> & Andrea Morello<sup>1</sup>

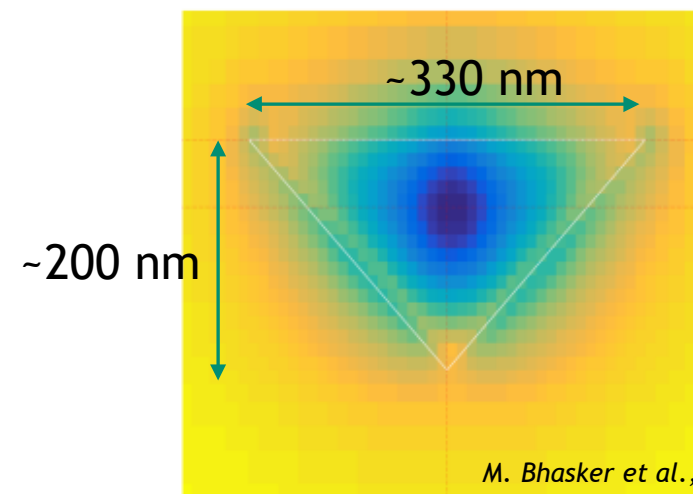

G. Tosi et al., Nat. Comm. 8, 450 (2017)

- Depth  $z_d = 15\text{-}20 \text{ nm}$
- Separation of  $100\text{-}500 \text{ nm}$

## Nanophotonic Applications

Center of mode is  $\sim 55 \text{ nm}$  below the surface of the waveguide

Low Energy Implantation? Lateral Positioning - OK, Target Depth - OK!

# Practical Example of FIB Implantation

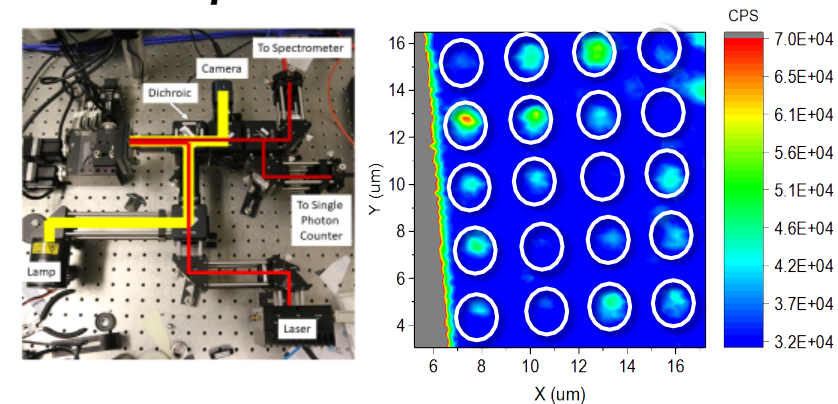

## Conversation of what is needed?

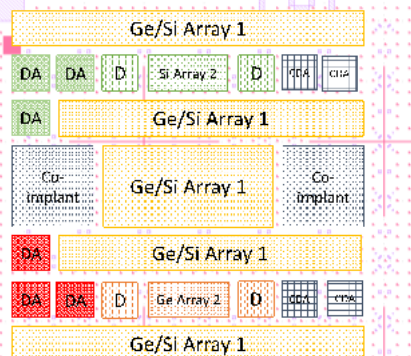

## FIB Implantation/Irradiation

## Post Implantation Characterization

## Design and layout of sample

## Post Implantation Sample Prep

# How can you access these capabilities? CINT User Proposals

## THE CENTER FOR INTEGRATED NANOTECHNOLOGIES

**One Scientific Community Focused on Nanoscience Integration**

The Center for Integrated Nanotechnologies (CINT) is a Department of Energy Office of Science Nanoscale Science Research Center. CINT offers world-leading scientific expertise and specialized capabilities to create, characterize, and integrate nanostructured materials at a range of length scales, from the nano- to meso-scale. It is jointly operated by Los Alamos and Sandia national laboratories and leverages the unmatched scientific and engineering expertise of the host labs.

### Science Thrusts

Integration is the key to exploiting the novel properties of nanoscale materials and creating new technologies. CINT's scientific staff and capabilities are organized around four interdisciplinary science thrusts which address different challenges in nanoscience integration.

#### *In-Situ Characterization and Nanomechanics*

Developing and implementing world-leading capabilities to study the dynamic response of materials and nanosystems to mechanical, electrical, or other stimuli.

#### *Nanophotonics & Optical Nanomaterials*

Synthesis, excitation, and energy transformations of optically active nanomaterials and collective or emergent electromagnetic phenomena (plasmonics, metamaterials, photonic lattices).

#### *Soft, Biological & Composite Nanomaterials*

Synthesis, assembly, and characterization of soft, biomolecular, and composite nanomaterials that display emergent functionality.

#### *Quantum Materials Systems*

Understanding and controlling quantum effects of nanoscale materials and their integration into systems spanning multiple length scales.

### User Program

CINT is an Office of Science national user facility. CINT helps the international research community perform cutting-edge research in the areas of nanoscience and nanotechnology, and is available free of charge for open science. As a user facility, CINT has the structure and mission to collaborate widely across academia, industry, and within DOE labs. Access is via peer-reviewed technical proposals. Proprietary research may be conducted in accordance with Federal regulations for full-cost recovery. CINT cannot provide funding to users.

The Center for Integrated Nanotechnologies (CINT) has both regular Fall and Spring call for proposals and Rapid Access available

<https://cint.lanl.gov/>

# FIB Implantation using the nanoImplanter and Velion

- Focused ion beam system (FIB)  
→ nm beam spot size on target
- ExB Filter (Wien Filter)  
→ Multiple ion species  
e.g., Li, Si, P, Sb, etc... (separating out  $^{28}\text{Si}$ ,  $^{29}\text{Si}$ , etc...)
- Fast blanking and chopping  
→ Single ion implantation
- Direct-write lithography  
→ nm targeting accuracy
- Low temperature stage
- In-situ electrical probes

kleindiek  
nanotechnik

Sb Source: Mass Spectrum

→ CeC alloy with

# Creation of Single Defect Centers in Wide Bandgap Substrates

- Defect centers in wide bandgap substrates have applications ranging from metrology, quantum computing, quantum sensing to biological

Ex. Silicon Vacancy Centers in diamond

The ion beam implantation and detection techniques are mainly material agnostic!

I. Aharonovich *et al.*, Rep. Prog. Phys. **74**,076501 (2011)

- How to produce a single defect center where you want it?
  - 1.) Location - focused ion beam implantation to control location
  - 2.) Yield - counted implantation to control the number of ions and in-situ PL to confirm an optically active defect center

# Location solved\*, use FIB implantation to control the spatial location

## Diamond Nanobeams (with Harvard)

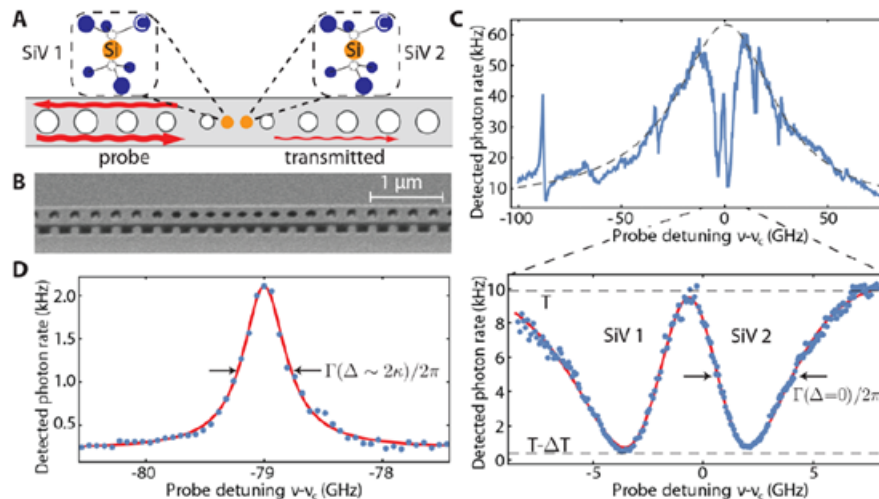

A. Sipahigil, *et al.*, *Science* (2016)

## 2D Photonic Crystals (with MIT)

T. Schroder, *et al.*, *Nature Communications* (2017)

R. E. Evans, *et al.*, *Science* (2018)

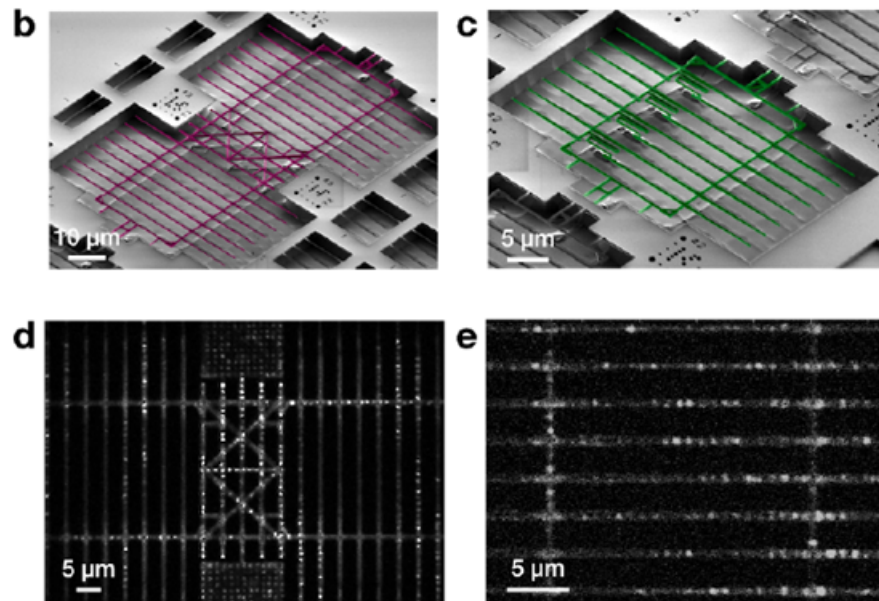

Spatial Accuracy is <50 nm

# Another set of CINT user projects using FIB Implantation

## Diamond waveguides with AlN photonics (with MIT)

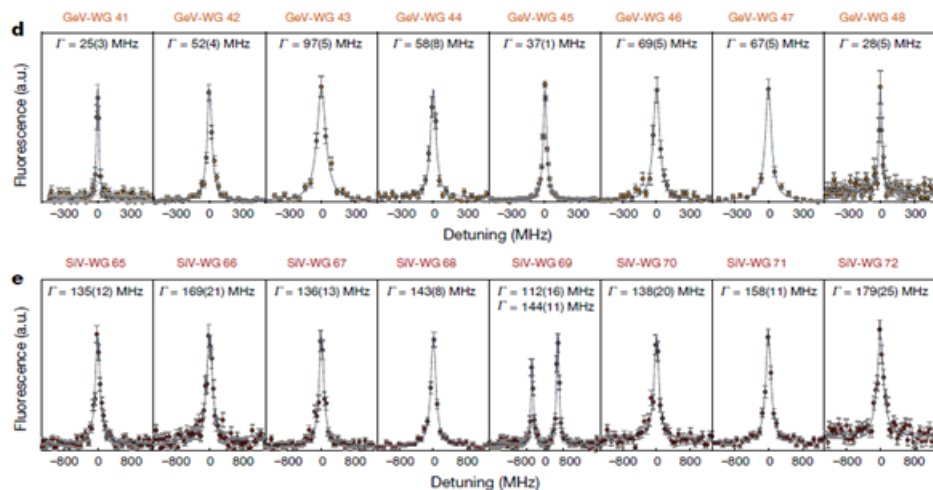

16 and 8 channel  
“quantum micro-  
chips”

Noel H. Wan *et al.*, *Nature*,  
583, 226-231 (2020)

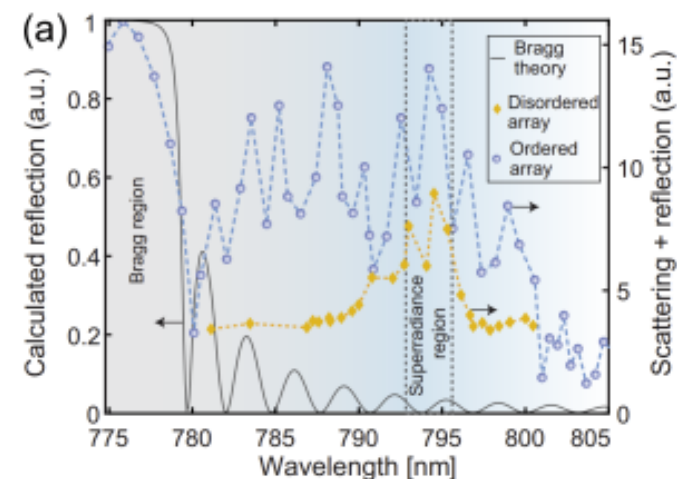

## Lithium Niobate Photonics (with Purdue)

D. Pak *et al.*, *Comm. Physics*, 5, 89 (2022)

FIB implantation works  
for a wide range of  
substrates

# We Use Counted Implantation and Photoluminescence to Better Understand the Yield

$$\text{Yield} = \# \text{ measured SiV} / \# \text{ implanted Si}$$

## In-situ Photoluminescence

- Low activation yield limits our ability to make high yield arrays

(Yield numbers are typically 3-10%)

- In-situ photoluminescence can reduce the error in the number of defect centers

## In-situ Counted Implantation

- Timed Implantation dominated by Poisson statistics for small numbers

(Uncertainty in number of ion is  $\sqrt{N}$ )

- In-situ counting can reduce the error in the number of implanted ions

# In-situ Counted Ion Implantation to control the number of implanted ion

$$\text{Yield} = \# \text{ measured SiV} / \# \text{ implanted Si}$$

Poisson Statistics

(Uncertainty in number of ion is  $\sqrt{N}$ )

## Ion Beam Induced Charge (IBIC)

$$\text{CCE} = \frac{\text{Charge Collected}}{\text{Charge Deposited}} \times 100$$

IBIC/detection demonstrated for low energy heavy ions

# Demonstrated Single Ion Diamond Detection at $<0.1>$ ions/pulse

30 ions / $<1>$ SiV	Timed	In-Situ	Post-Analysis
False Positives	-	$< -1$ ppb	2.3 %
False Negatives	-	8.6 %	-0.9 %
Multiple Ions	-	5.8 %	1.7 %
Single as Double	-	-	-0.2 %
<b>Total</b>	<b>+18.3 / -18.3 %</b>	<b>+14.4 / -0 %</b>	<b>+4.0 / -1.1 %</b>

- 7x improvement in the error in implanted ions as compared to timed implantation

*Titze et al, Nano Letters 22, 3212-3218 (2022)*

- Aside,  $<0.1>$  ions/pulse using a  $1 \mu\text{s}$  pulse length needs  $\sim 30$  fA of beam current or  $\sim 100\text{k}$  ions/s

In-situ counting to reduce the error in the number of implanted ions

# In-situ Photoluminescence to confirm optical defect center

$$\text{Yield} = \# \text{ measured Vsi} / \# \text{ implanted Si}$$

We switched from SiV in diamond to Vsi in SiC as can measure as implanted samples without annealing

Two-step process enabled by high resolution implantation:

- (1) Aligned implantation, <40 nm
- (2) Detect PL

In-situ PL to confirm the optically emission from the defect centers

# Demonstration of In-situ Photoluminescence in SiC

Design of array

Alignment markers

- $\langle 500 \rangle$  Ions/spot implanted once that acts as landmark to find in-situ arrays during PL check
- In-situ array points to be filled

Implant Alignment Grid

Implant/PL Repeat to fill Array

Chandrasekaran *et al*, Adv. Sci., 2300190 (2023)

Preliminary results suggest the in-situ PL works, BUT is limited by high background counts

# *Ex-situ* $g^2(\tau)$ check on $\langle 3 \rangle$ ions/spot arrays shows single defects

3 representative examples (okay, good examples ☺!)

\*No background correction

Chandrasekaran *et al*, Adv. Sci., 2300190 (2023)

9/16 (56%) of filled array points showed  $g^2(0) < 0.5$  without background correction → single defects

# Summary

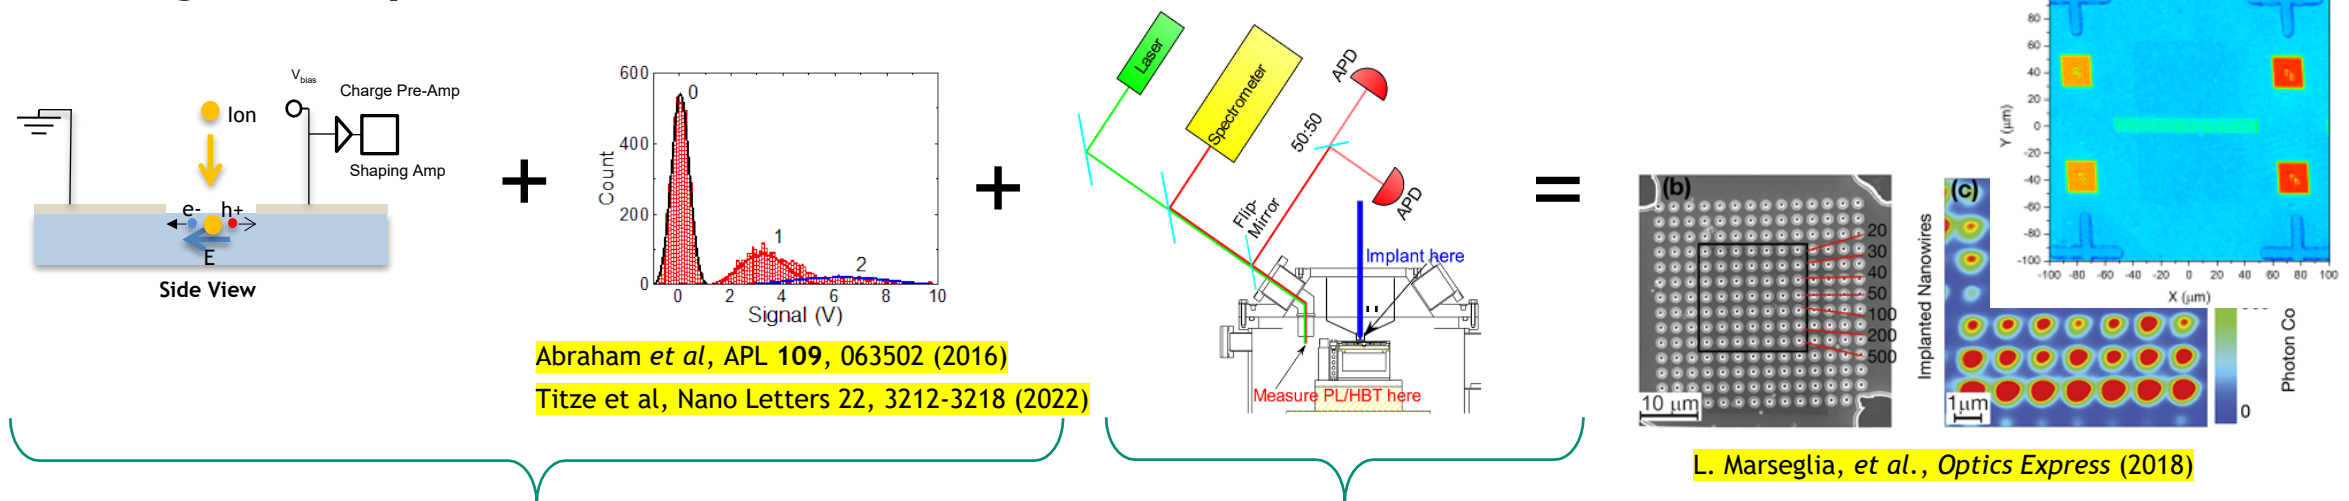

## - We have demonstrated focused ion implantation for fabrication of single atom devices and nanofabrication

- Viable solution for prototyping - fast and easy!
- On-going work in diamond, SiN, SiC, hBN, GaN, AlN, GaOx, etc...
- LMAIS for 42/114 elements and development still on-going

Multiple sources run, with ~1.5 days of runtime

## - Pathway Towards Deterministic Defect Centers in Wide Bandgap Materials using FIB Implantation

Control the number of ions

Confirm Optically Active Defect Centers

# Ion Implantation and Irradiation for Device Fab

Ion Implantation has been a work-horse for the semiconductor industry

S. B. Felch, *et al.*, Proceedings of PAC2013, Pasadena, CA (2013)

Our work is centered on localized implantation and fabrication based on a deterministic number of implanted ions

Y. Sohn, *et al.*, Nat. Communications **9**, 2012 (2018)

Singh *et al.* Appl. Phys. Lett. **108**, 062101 (2016)

**Focused Ion Beam** implantation for fabrication of single atom devices and nanofabrication

# Capability Currently Under Development

## Pulsed Power Electron Gun

### Specifications

- 300 keV
- $\gg 10$  A of beam current
- $< 25$  ns pulse lengths

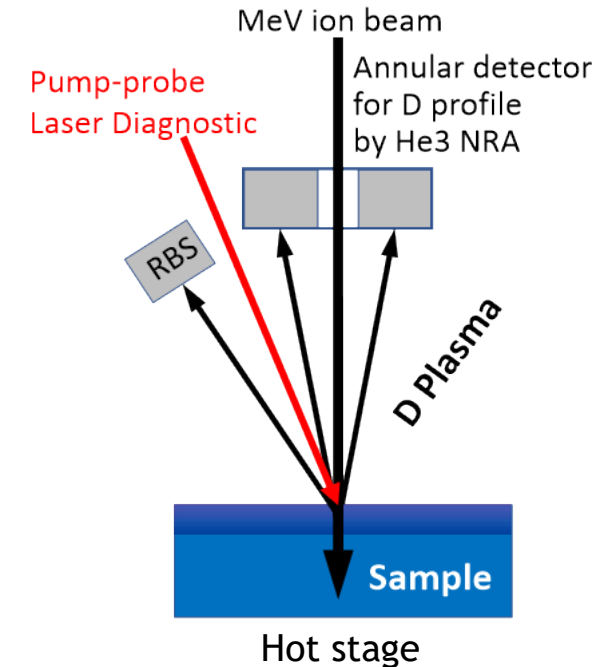

*Enables improved yield for wide bandgap defect centers*

## Low Energy Implantation Stage

*Enables lower energy implantation, albeit with a loss of spatial resolution*

## Combined Ion Irradiation + Ion Beam Analysis + Plasma Exposure

*Enables exploration of real-time evolution in sample properties including erosion and redeposition*

## Pb Source based on SnPb alloy

- Solder (SnPb) does not wet W, but Solder does wet a soldering iron
- We attempted multiple homemade sources made from Fe, Monel, Kanthal, Kovar. Of these Kovar (Fe-Ni-Co) gave the best performance
- We tested both mechanically cut and electrochemically etched tips welded to the reservoir to improve alloy flow and heating

As tested in the Raith Velion these tips achieve lifetimes of  $<2000 \mu\text{A}\cdot\text{hr}$  and spot sizes of  $<40$

nm

### Mechanically cut tips

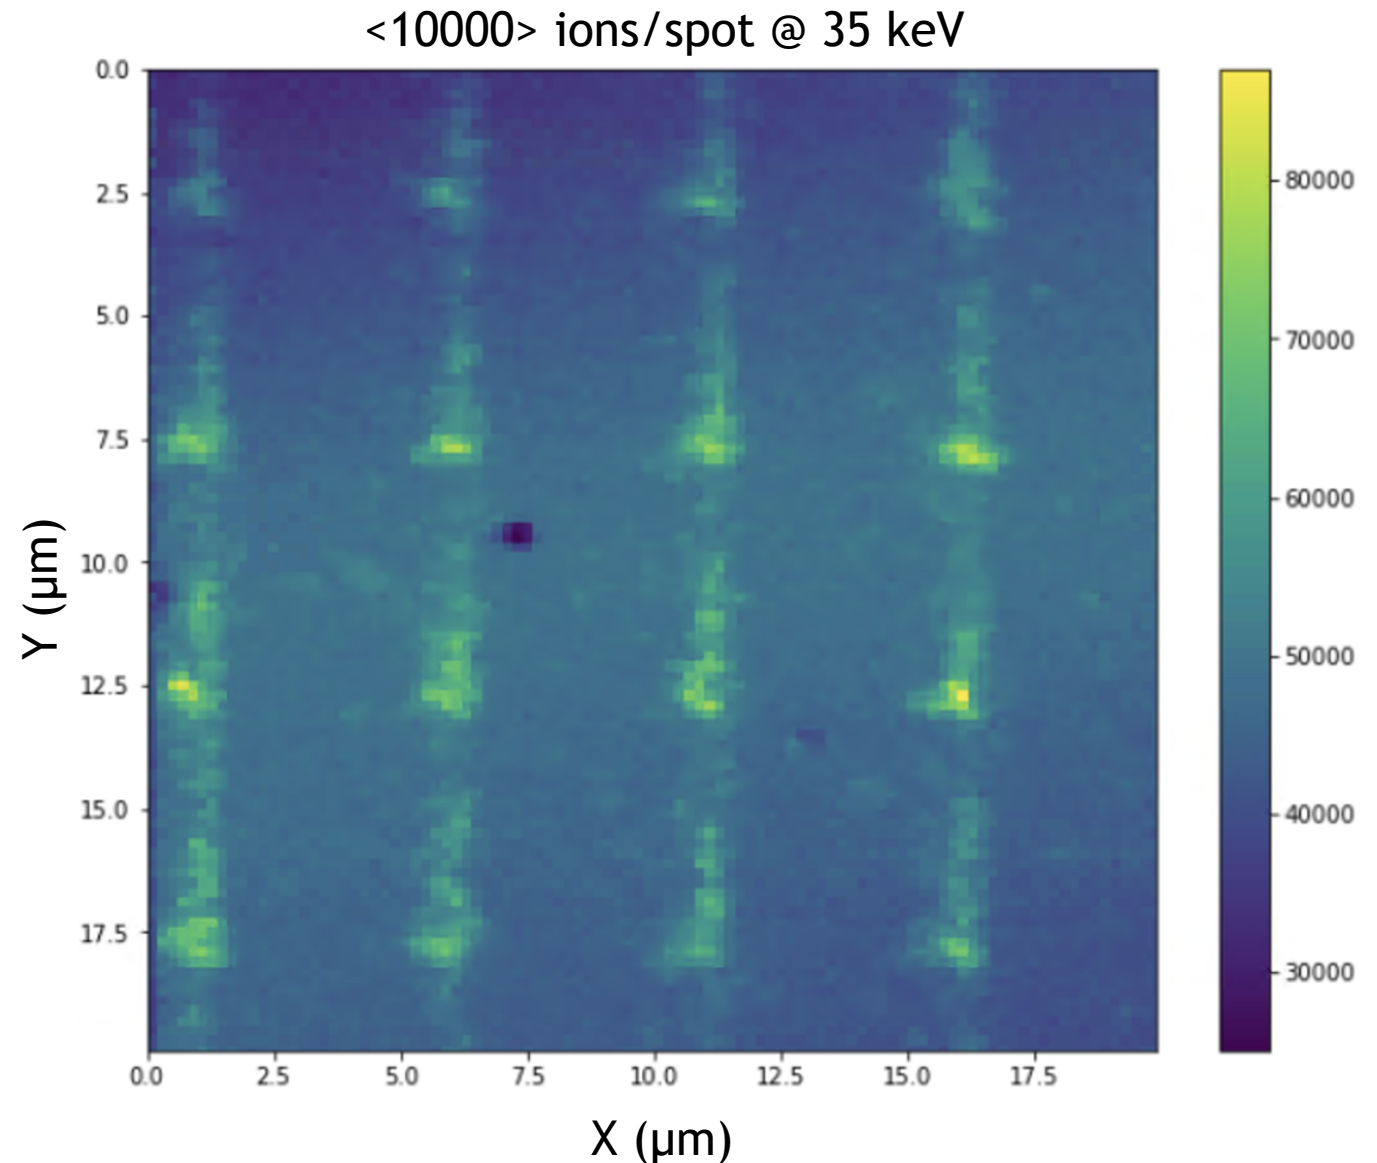

### Electrochemically etched tips using Iron Chloride

# Preliminary Example of PbV in Diamond Substrate

- Observed PbV spectral signature in diamond substrates using FIB implantation
- Vertical stripes in the datasets?
  - Different Pb isotopes?
    - $^{208}\text{Pb}$  ( $\approx 52\%$ )
    - $^{206}\text{Pb}$  ( $\approx 24\%$ )
    - $^{207}\text{Pb}$  ( $\approx 23\%$ )
    - $^{204}\text{Pb}$  ( $\approx 1\%$ )
  - In the Raith Velion our  $m/\Delta m$  is not large enough to isolate the individual isotopes

# Fabrication of a Nitrogen Liquid Metal Alloy Ion Source

Need a low melting point (200-500C) alloy containing N, what to use?

## Implantation

Implanted a 200  $\mu\text{m}$  thick  $\text{Au}_{80}\text{Sn}_{20}$  foil with Nitrogen to  $5 \times 10^{17}$  ions/ $\text{cm}^2$

→ Implantation level chosen based on solid-solubility limit for H

200 keV  $\text{N}^+$   
Implantation

## Characterization

Elastic Recoil Detection (ERD) is used to probe the first 100 nm of the implanted foil

→ Limited interrogate depth due to multiple scattering of ions

We can produce the material, *but* can we make a usable LMAIS?

B. L. Doyle and P. S. Peercy, Appl. Phys. Lett. 34, 811 (1979)

# Tip fabrication from implanted AuSnN foil

- (1) Heat W tip to remove surface contaminants
- (2) Tack weld on implanted foil to the tip
- (3) Heat tip to melt the foil onto the tip
- (4) Repeat steps (2) and (3) until tip and the reservoir is filled
- (5) Test tip for emission
- (6) Install tip into nanoImplanter

Very challenging source preparation! How well does the N LMAIS run?

# N Source Characterization - Mass Spectrum via IBIC

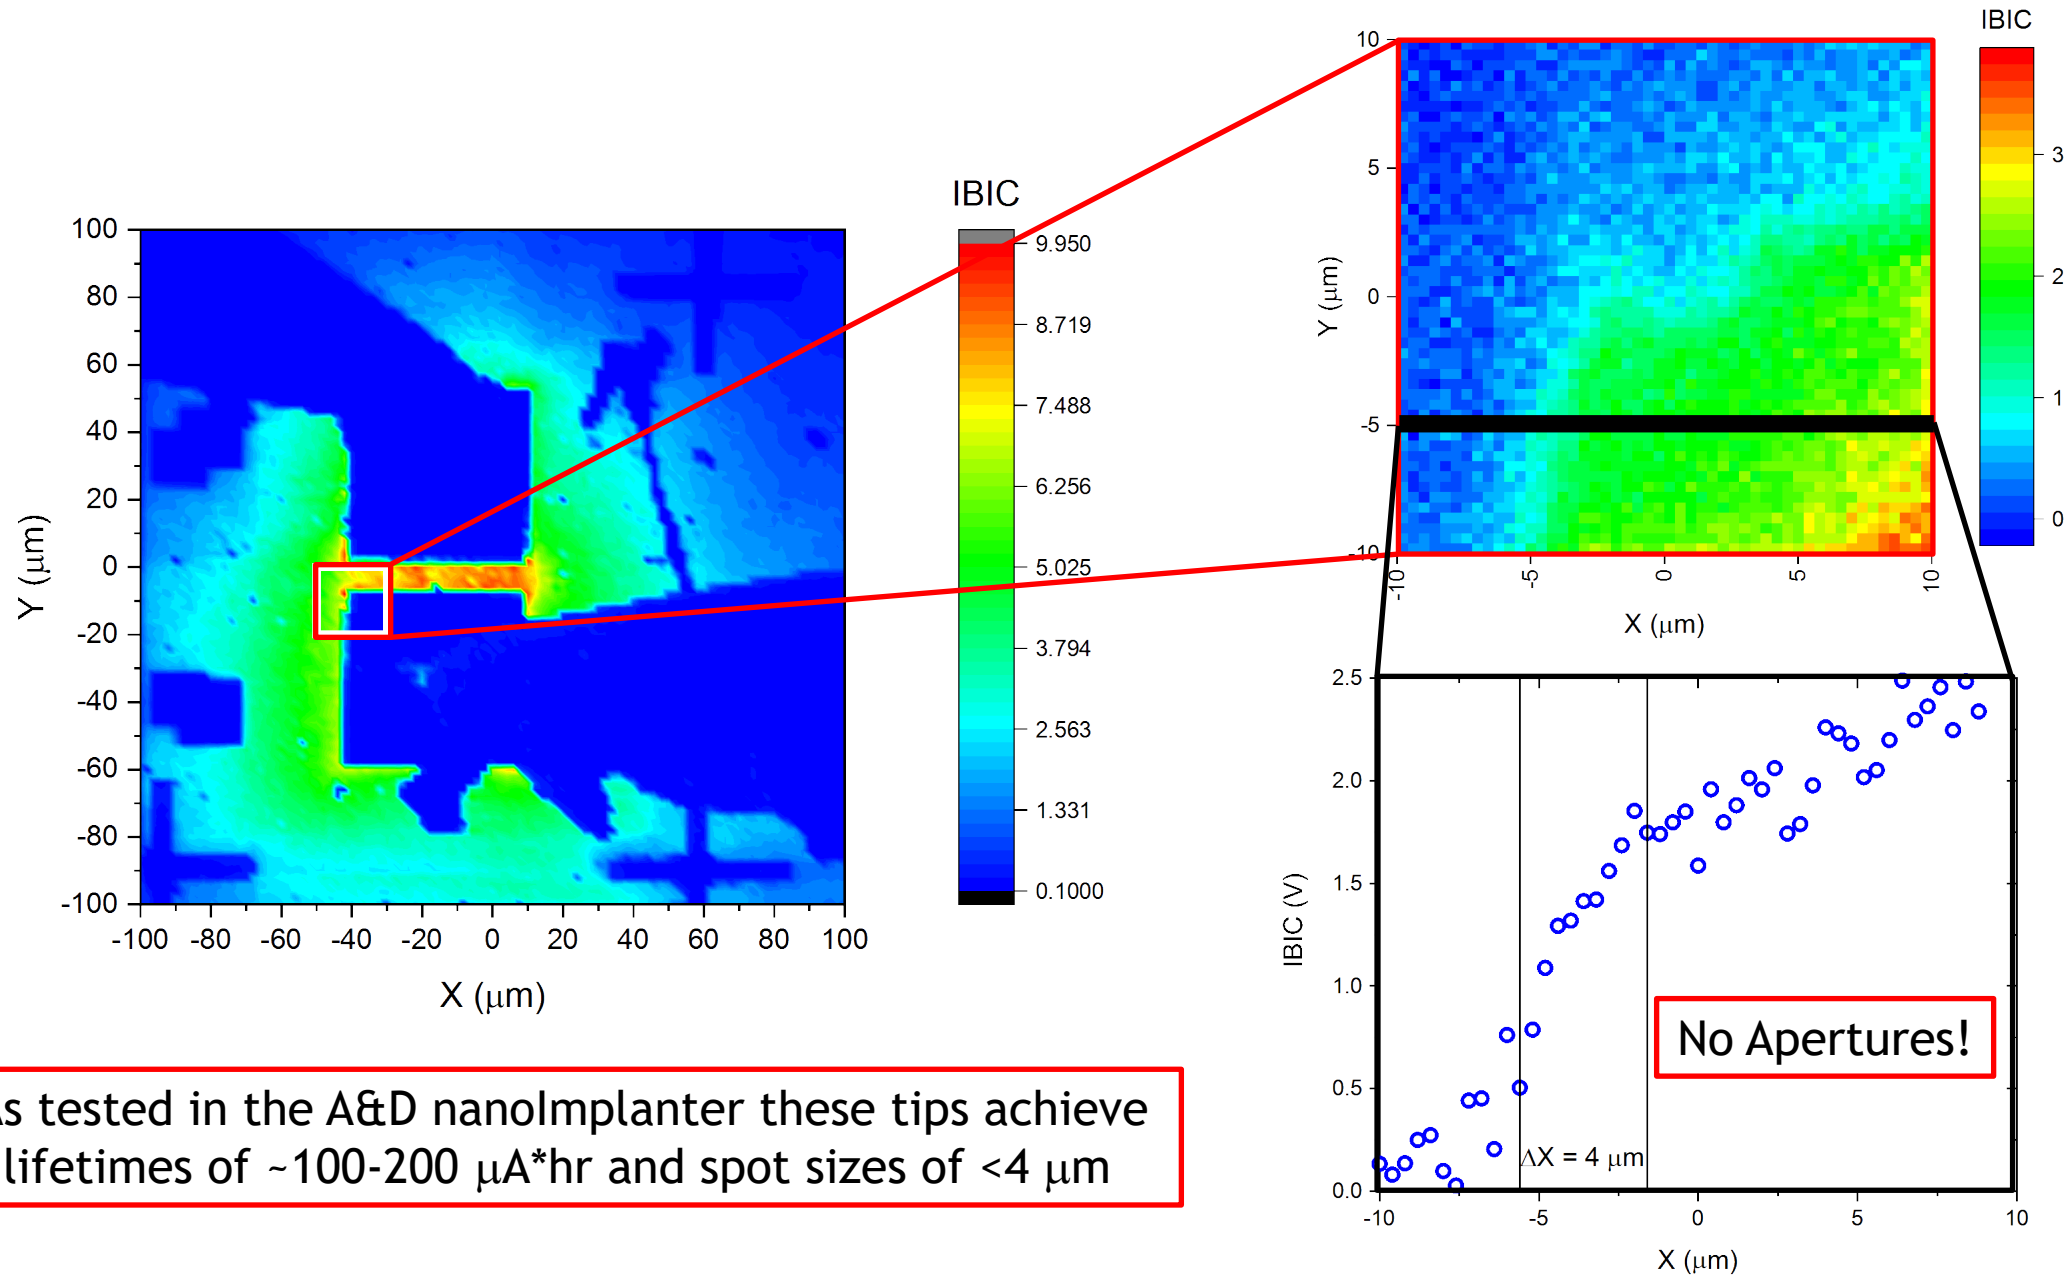

Ion Beam Induced Charge (IBIC) to measure N beam

Observe Atomic nitrogen single and doubly charged ions in the source at ~20k ions/s

# N Source Characterization - Spot Size via IBIC

As tested in the A&D nanoImplanter these tips achieve lifetimes of  $\sim 100\text{-}200 \mu\text{A}\cdot\text{hr}$  and spot sizes of  $<4 \mu\text{m}$

# Characterization - Beam Current measured via IBIC

1. Fit peak to Gaussians
2. Area under peak corresponds to likelihood of event

$\langle 1 \rangle$  ion every  $50 \mu\text{s} \equiv 20 \text{ k ions/s}$

# N Source – Improvements

Higher beam current

- Thinner foil to same fluence → higher overall concentration
- Fabrication in N atmosphere → additional N absorption

# Photoluminescence of the counted sample shows single defects

PL map of the counted ion sample

Heejun Byeon and  
Andrew Mounce at CINT

High confidence in the number of implanted Si ions → confirmed by  $g^2(\tau)$

# Hanbury-Brown-Twiss Interferometry

Single emitter will emit only 1 photon at a time

2<sup>nd</sup> order autocorrelation

Only 1 photon at each counter at any time

Not all locations identified as single emitters from PL are single emitters
