⁴Lawrence Livermore National Laboratory

⁵Sandia National Laboratories

This work was done by Mission Support and Test Services, LLC, Under Contract No. DE-NA0003624 with the U.S. Department of Energy, and the Office of Defense Nuclear Nonproliferation Research and Development.

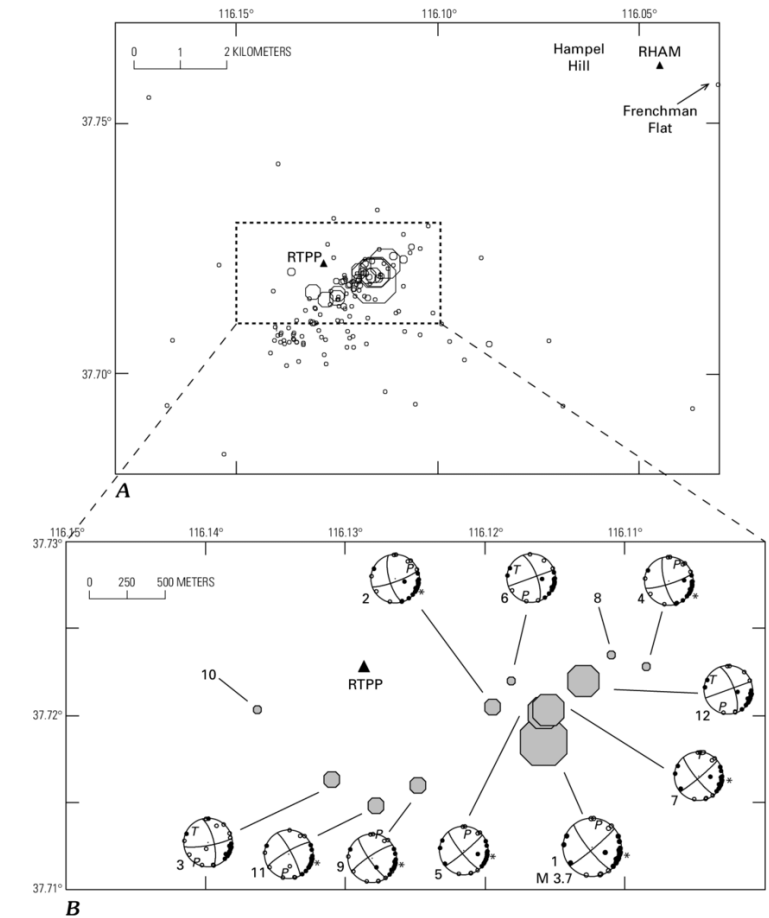

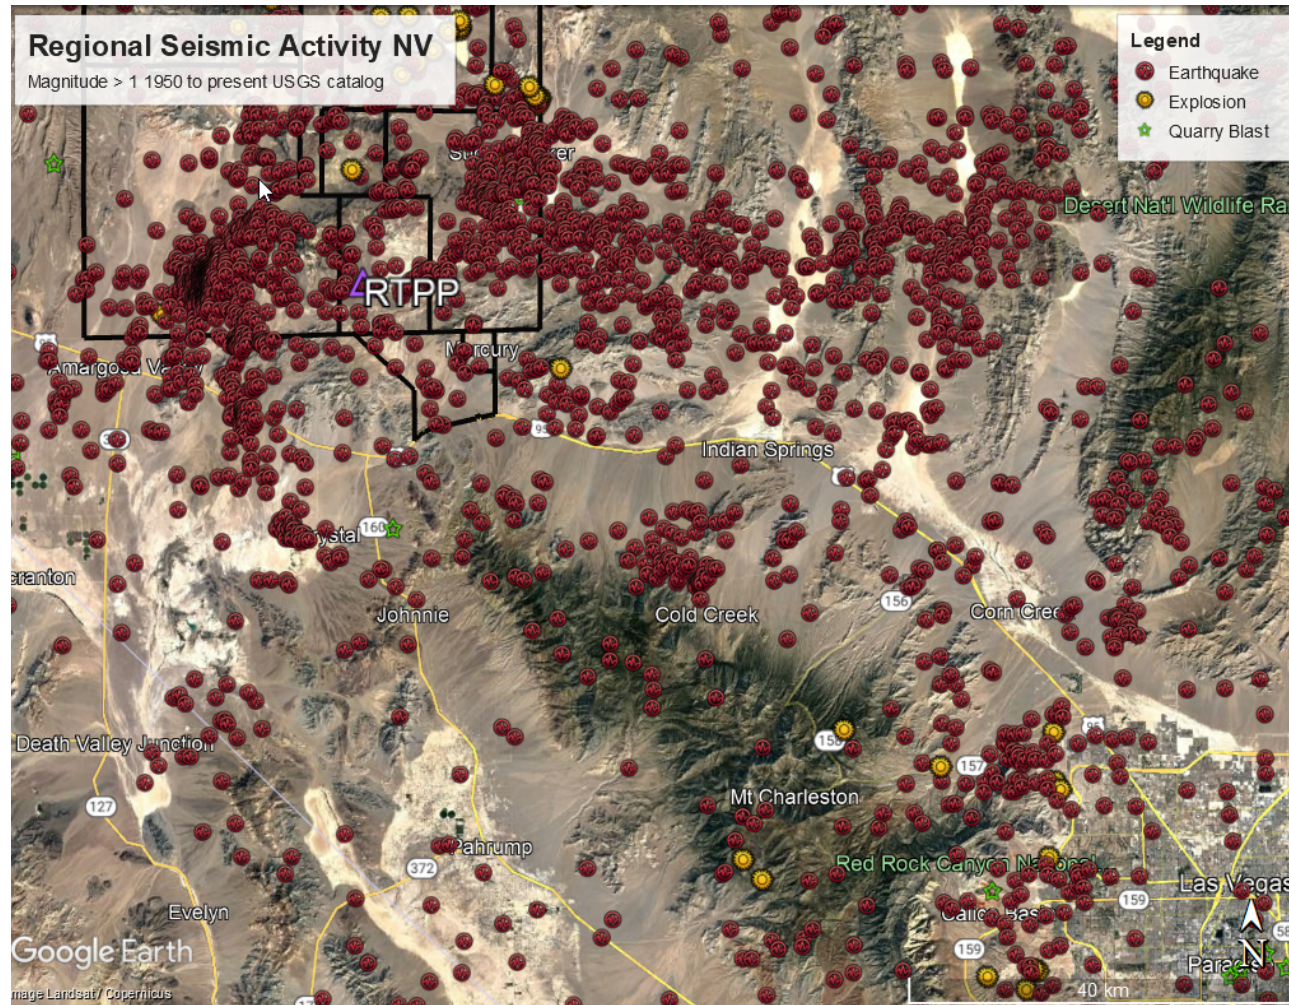

Los Alamos National Laboratory, an affirmative action/equal opportunity employer, is operated by Triad National Security, LLC for the National Nuclear Security Administration of U.S. Department of Energy under contract 89233218CNA000001.

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC., a wholly owned subsidiary of Honeywell International, Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA-0003525.

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract DE-AC52-07NA27344. Lawrence Livermore National Security, LLC

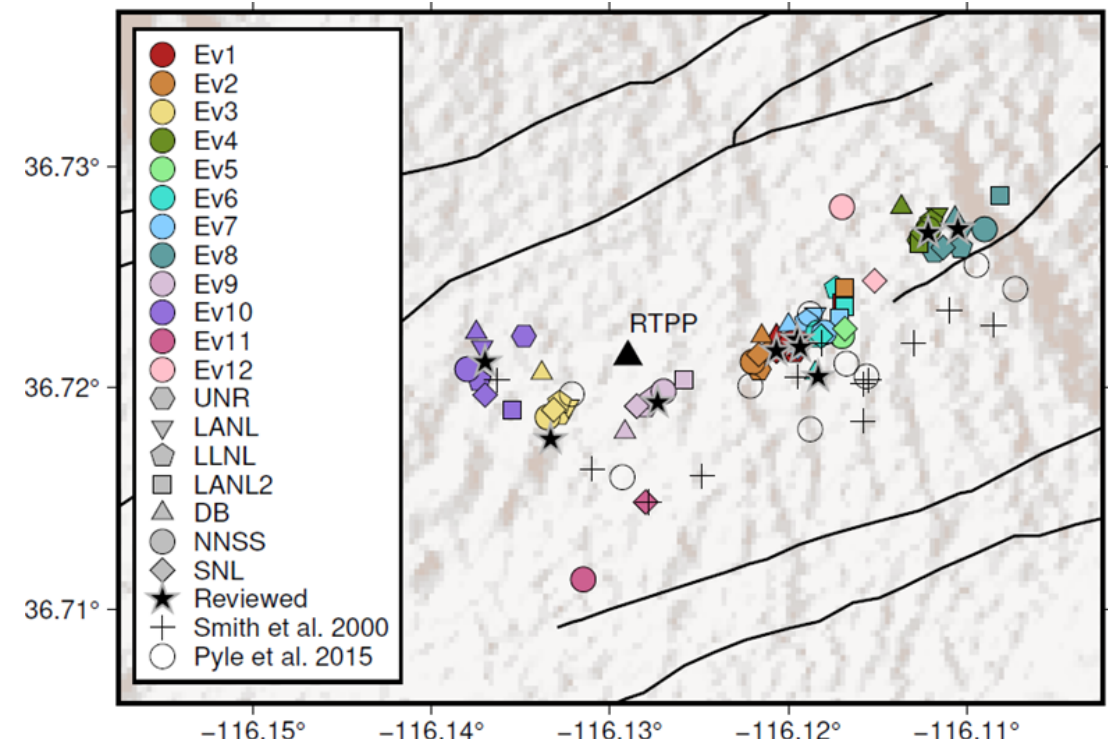

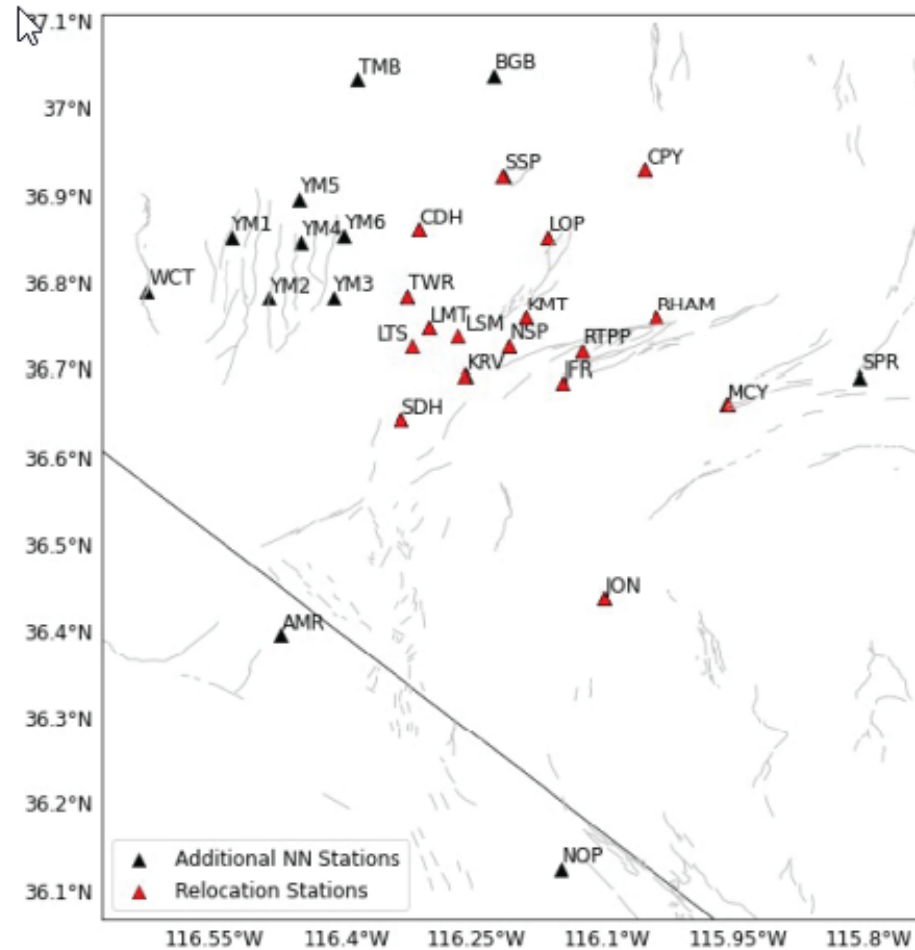

- Manually refining picks is a time consuming effort but ultimately gives the best assurance of repeatable picks across event/station pairs
- The manually refined picks aligned with predicted fault traces
- Historical metadata can be tricky to untangle between institutions
- A combination of normalizing amplitudes and set time windows can aid in improving the manual correlations
- To prepare for RV/DC planning and testbed development constraints on the hypocenter were requested

1993 Rock Valley Sequence

Conclusions

- The majority of the events align better with known faults when picked consistently
- Revisiting historical sequences is a nontrivial endeavor, especially when you are working cross multiple contributors
- Simulating random error in the picks, the locations trended along the fault
- Future work
 - Add additional stations
 - Train automated process to replicate/correct picks based on these features
 - Use dense geophone deployments to help constrain depths and locations of ongoing seismicity
