# Data-Driven Optimization of Interlocking Metasurface Design

***Nathan Brown, Benjamin Young, Brett  
Clark, Ophelia Bolmin, Brad Boyce, Philip  
Noell***

*Sandia National Laboratories*

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

# What are interlocking metasurfaces (ILMs)?

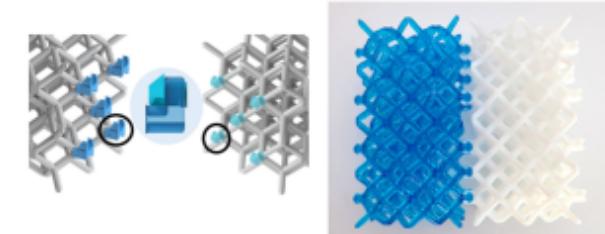

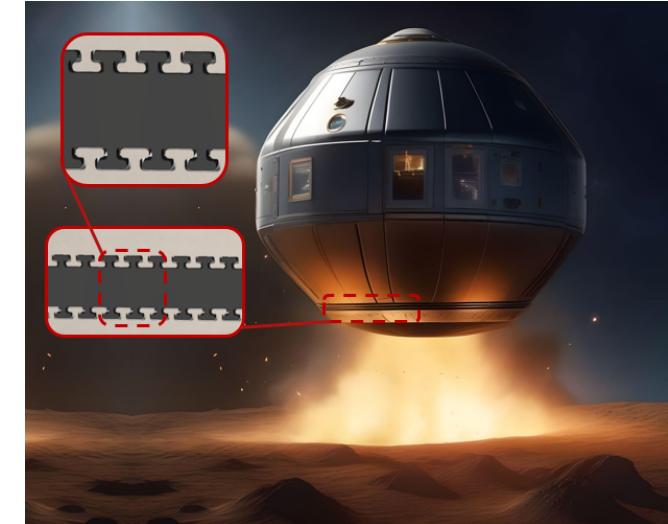

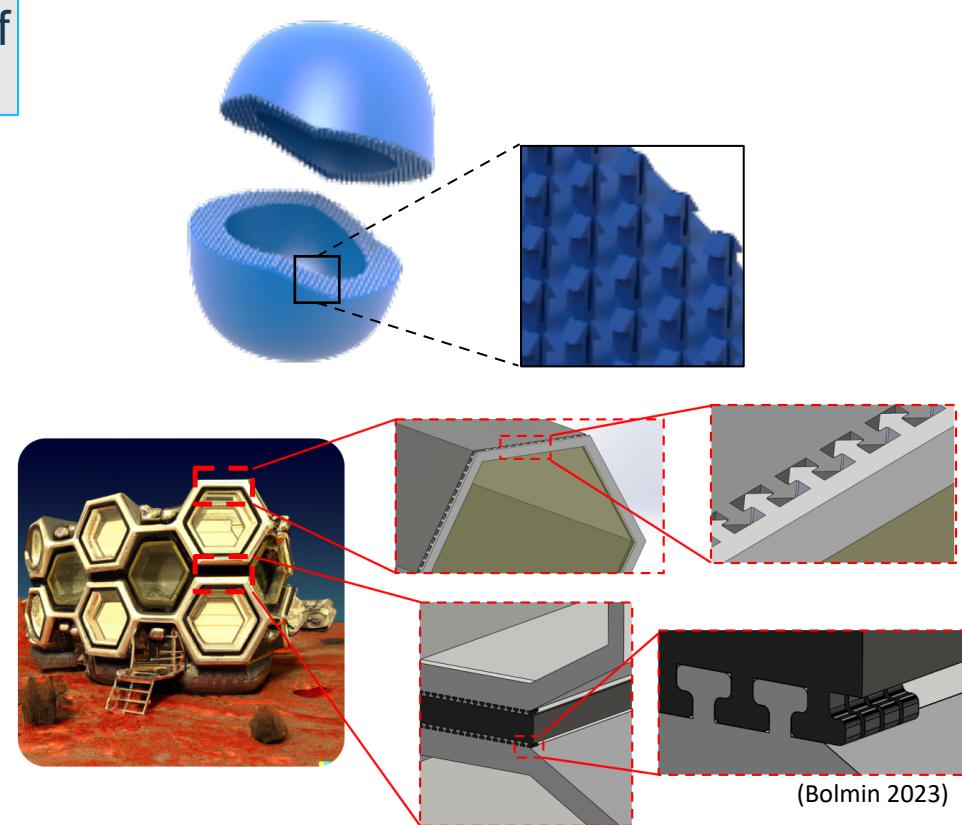

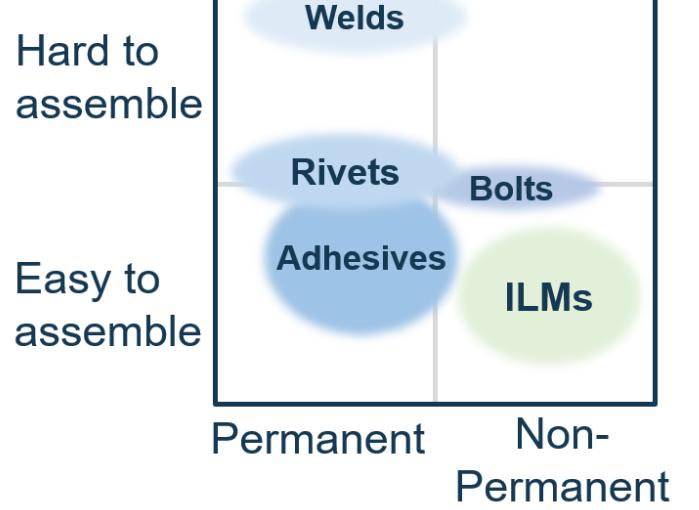

Robust  
Architected  
Non-Permanent  
Integrated

joining technology  
suitable for

complex surfaces  
dissimilar materials  
extreme  
environments

ILMs overcome many limitations of  
existing joining methods

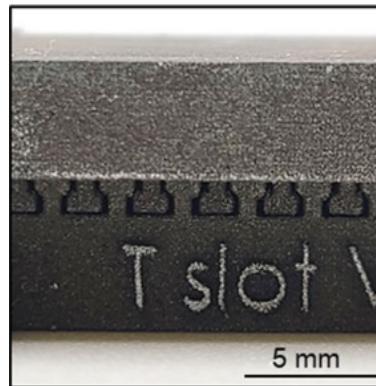

# Tailoring Mechanical Performance

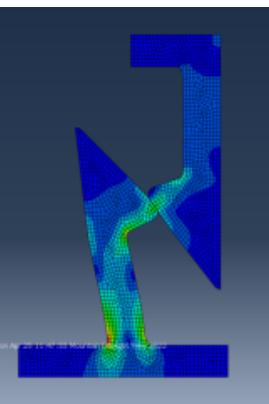

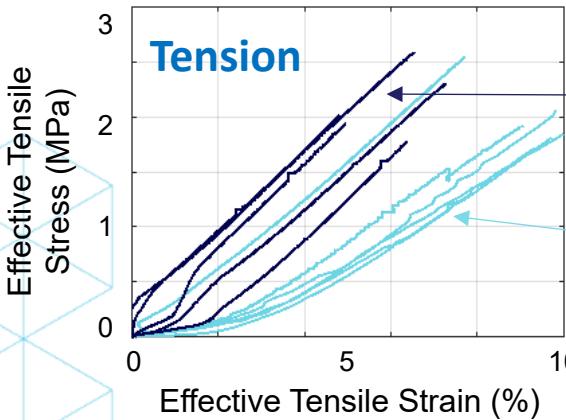

- Robustness controlled by ILM's **unit cell design**, constitutive material, and unit cell interaction

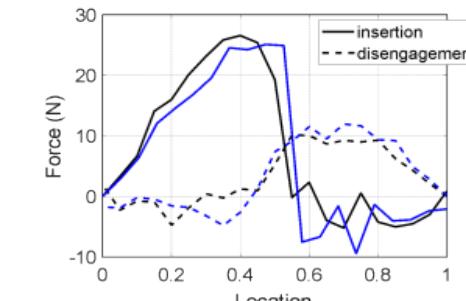

## Failure Criteria

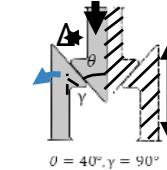

Snapping T-slots

## Remateability

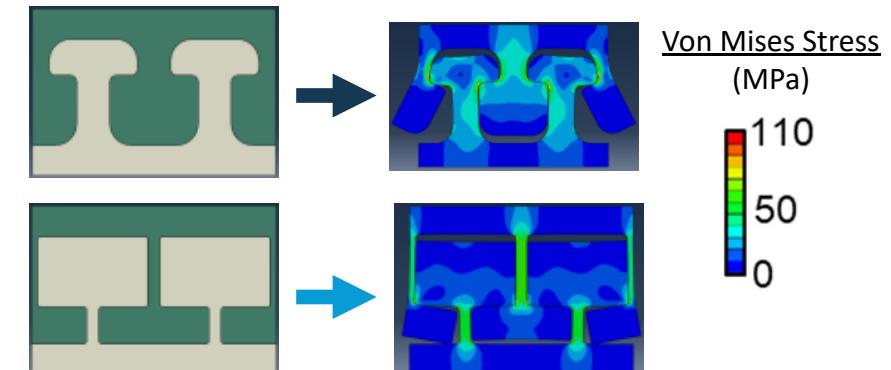

$$\begin{aligned} \theta = 40^\circ, \gamma = 60^\circ \\ \theta = 40^\circ, \gamma = 70^\circ \end{aligned}$$

$$F > \frac{3EI}{l^3} \Delta \frac{\mu + \tan(\theta)}{1 - \mu \tan(\theta)}$$

## Stress Uniformity

# Design Methodology Comparison

- Evaluate ILM unit cell performance and capabilities of 4 distinct design methods

## Human Intuition

- Expertise
- Experiences
- Nature

## Parametric Opt.

- Geometrically parameterize a design
- Optimize parameters according to objectives and constraints

## Genetic Algorithm

- Elementally Discrete domain (voxelized design)
- Evolutionary algorithm: Cross-populating and mutations

## Conditional Diffusion Model

- Single-shot generation
- Conditions based on objectives/constraints
- Thermo-mechanical properties

Direct design comparison in tension and shear, including experimental validation

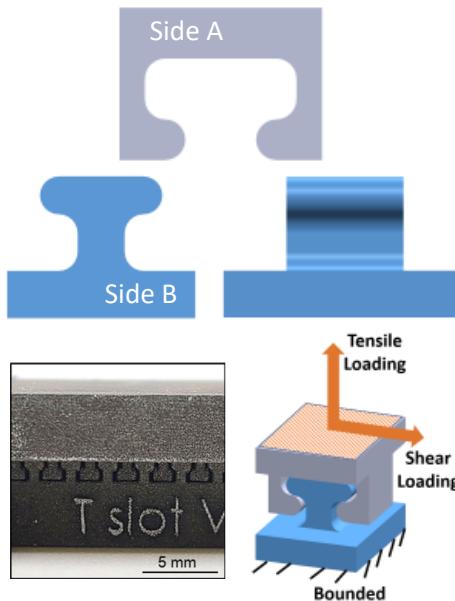

Rapid unit cell generation with emphasis on generalizability

# Topology Comparison Methods

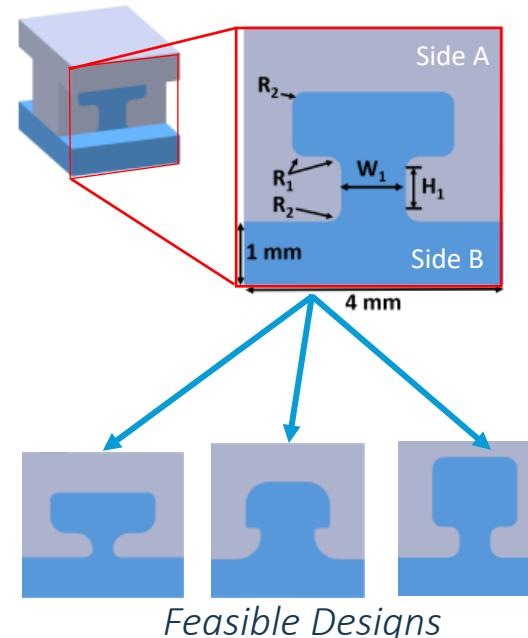

## Human Intuition

- “Sliding T-slot”
- Based on designer’s expertise
- No additional optimization

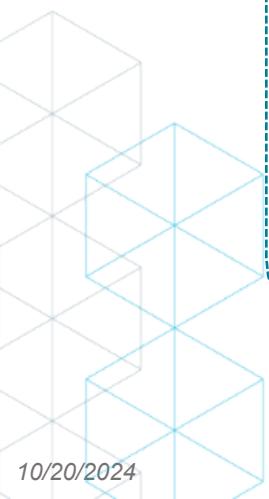

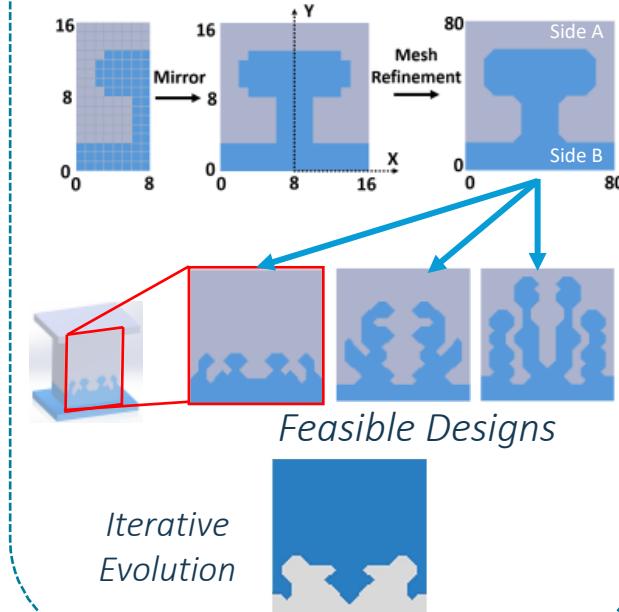

## Parametric Optimization

- Parameterized T-slot
- Gradient-based optimization
- Maximize Strength: Tension, Shear, Weighted-sum

## Genetic Algorithm

- Evolutionary optimization
- 16x8 mirrored discretized design domain
- Single and Multi-Objective Optimization (Tension/Shear)

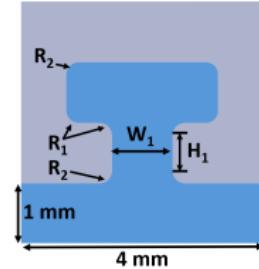

# Design Results

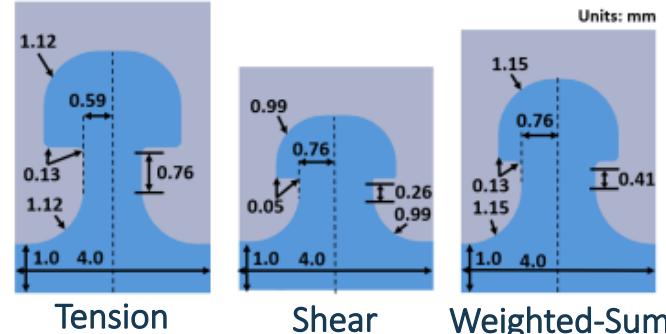

## Parametric Optimization

- Parametrization limit uniqueness between topologies
- Differences in height and width

### Initial Design

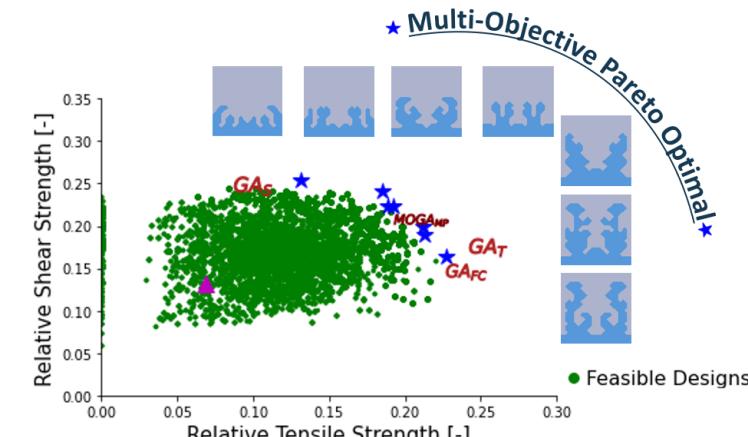

### Optimized Designs

## Genetic Algorithm

- Considerable changed in topology corresponding to objective
- Non-intuitive designs
- **Tension:** Tall, Dendritic    **Shear:** Short, sturdy

MOGA: Multi-Objective Genetic Alg.

Constrained: Mimics “infinite” unit cell tessellation

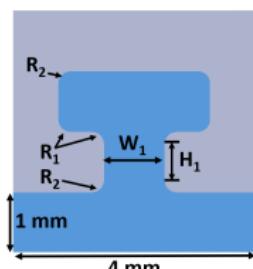

# Design Results

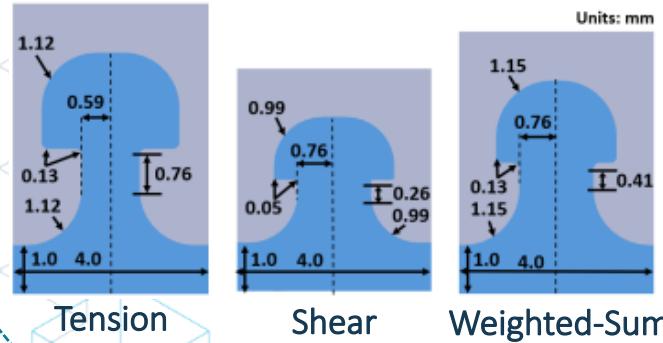

## Parametric Optimization

- Parametrization limit uniqueness between topologies
- Differences in height and width

### Initial Design

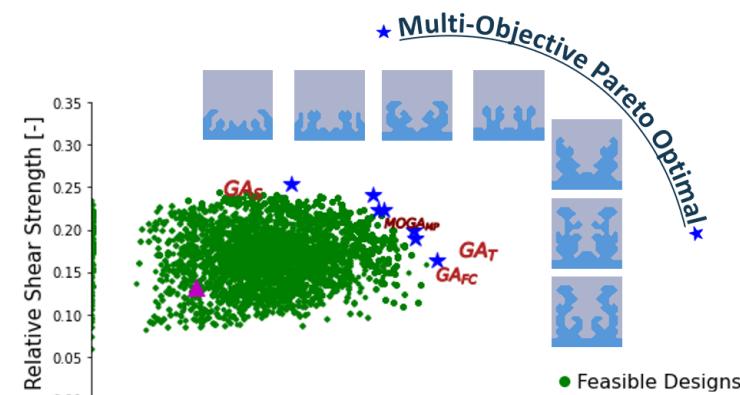

### Optimized Designs

## Genetic Algorithm

- Considerable changed in topology corresponding to objective
- Non-intuitive designs
- Tension:** Tall, Dendritic      **Shear:** Short, sturdy

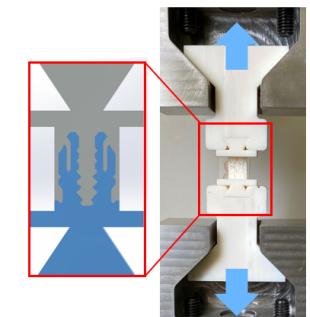

MOGA: Multi-Objective Genetic Alg.

Constrained: Mimics “infinite” unit cell tessellation

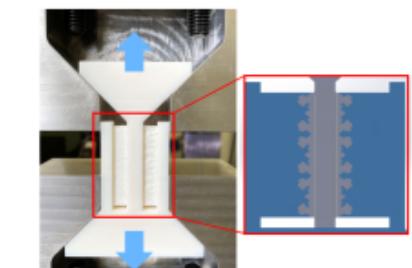

## Experimental Testing

- Tested in 1x1, 1x3, and 1x1 Fully Constrained configurations
- Extruded 2D surfaces

### Tension Testing

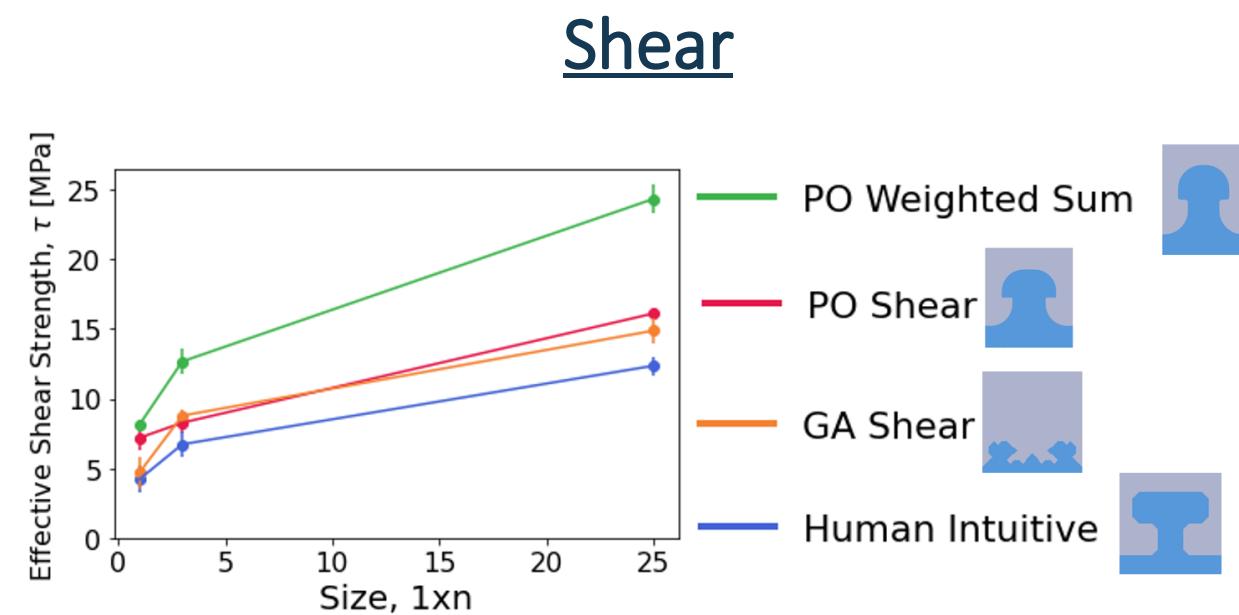

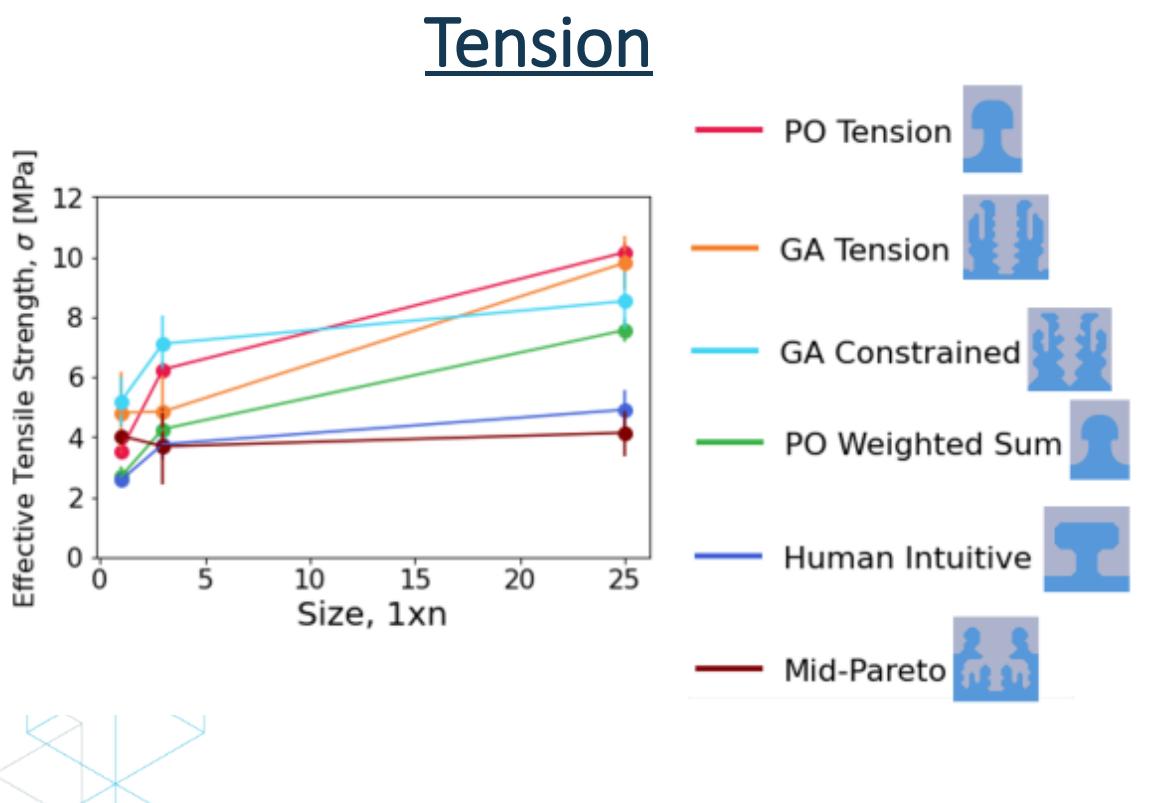

### Shear Testing

# Experimental Results

- Both optimization method result in considerable strength increase
- Effective strength increases with tessellation size → Unit Cell Interactions

# Design Methodology Comparison

- Evaluate ILM unit cell performance and capabilities of 5 distinct methods

## Human Intuition

- Expertise
- Experiences
- Nature

## Parametric Opt

- Geometrical

## Genetic Algorithm

- Conceptually Discrete
- Parallelized

**Conclusion: The unit cells of ILMs can be optimized to achieve considerable increases in strength for various tessellation sizes**

## Conditional Diffusion Model

- Single-shot generation
- Conditions based on objectives/constraints
- Thermo-mechanical properties

Direct design comparison in tension and shear, including experimental validation

Rapid unit cell generation with emphasis on generalizability

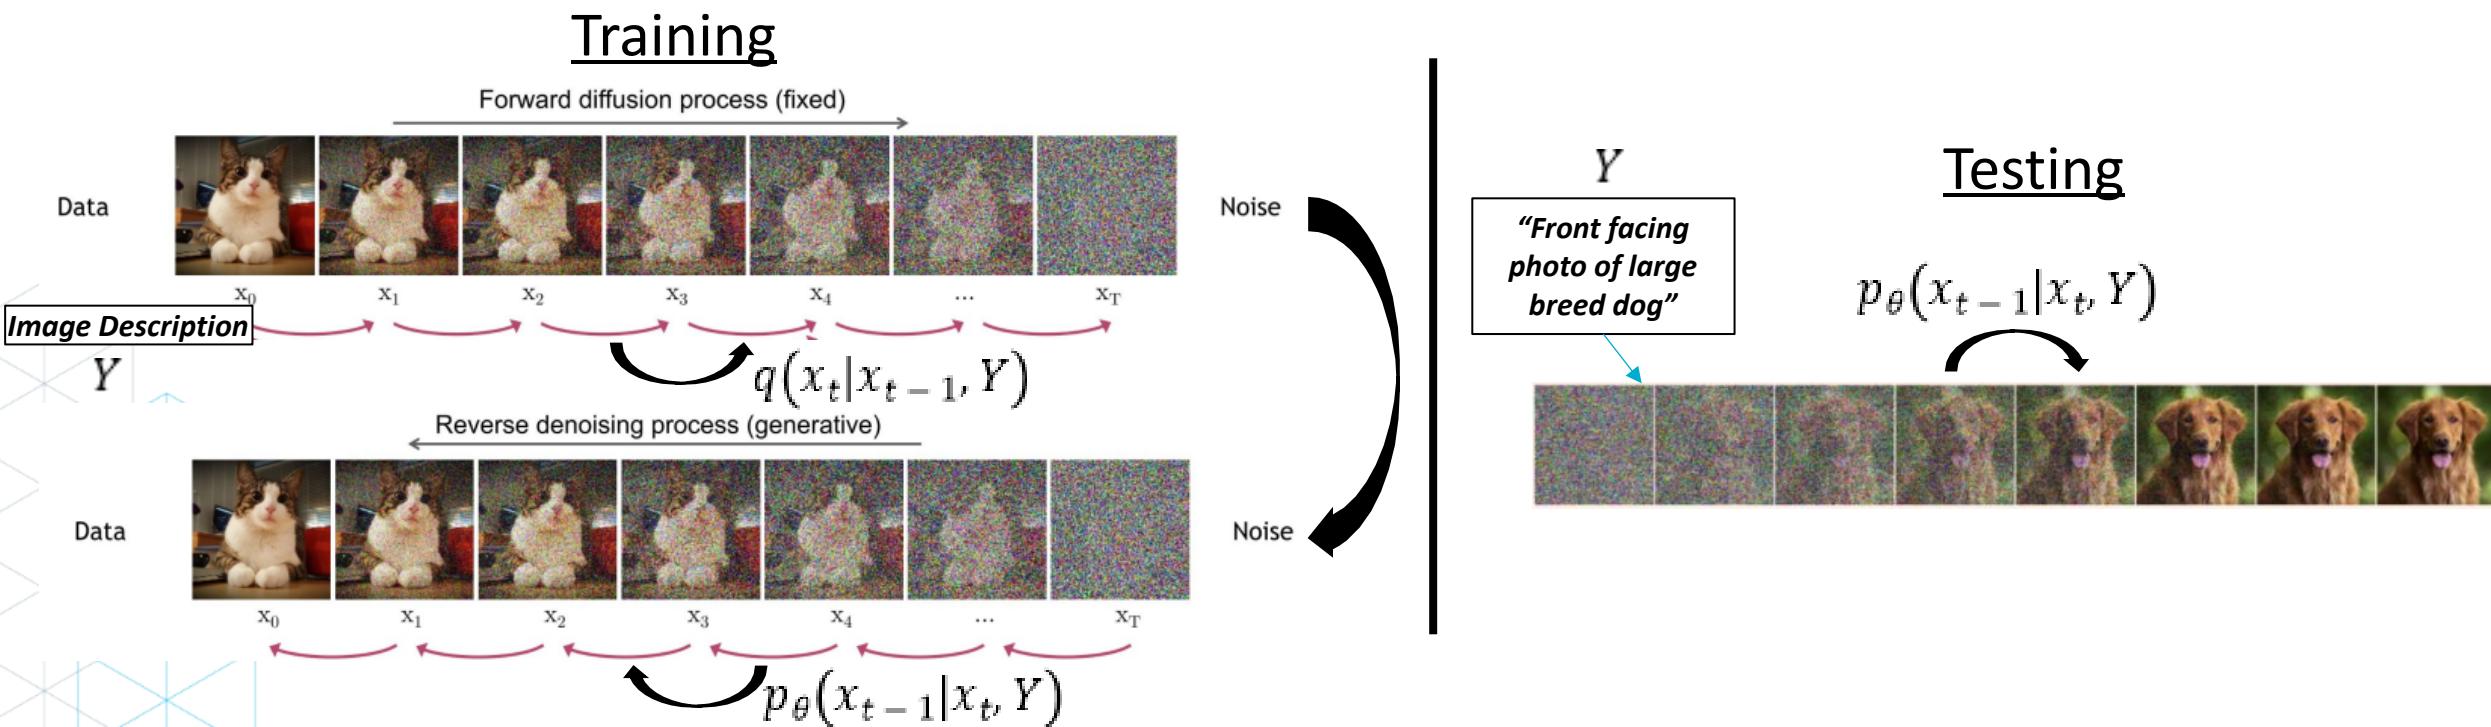

- **CDM**: Generative AI method to generate data by iteratively refining random noise, guided by specific conditions or inputs, to produce highly realistic/practical outputs
- Commonly used for “text-to-art” generation →  

(MidJourney)

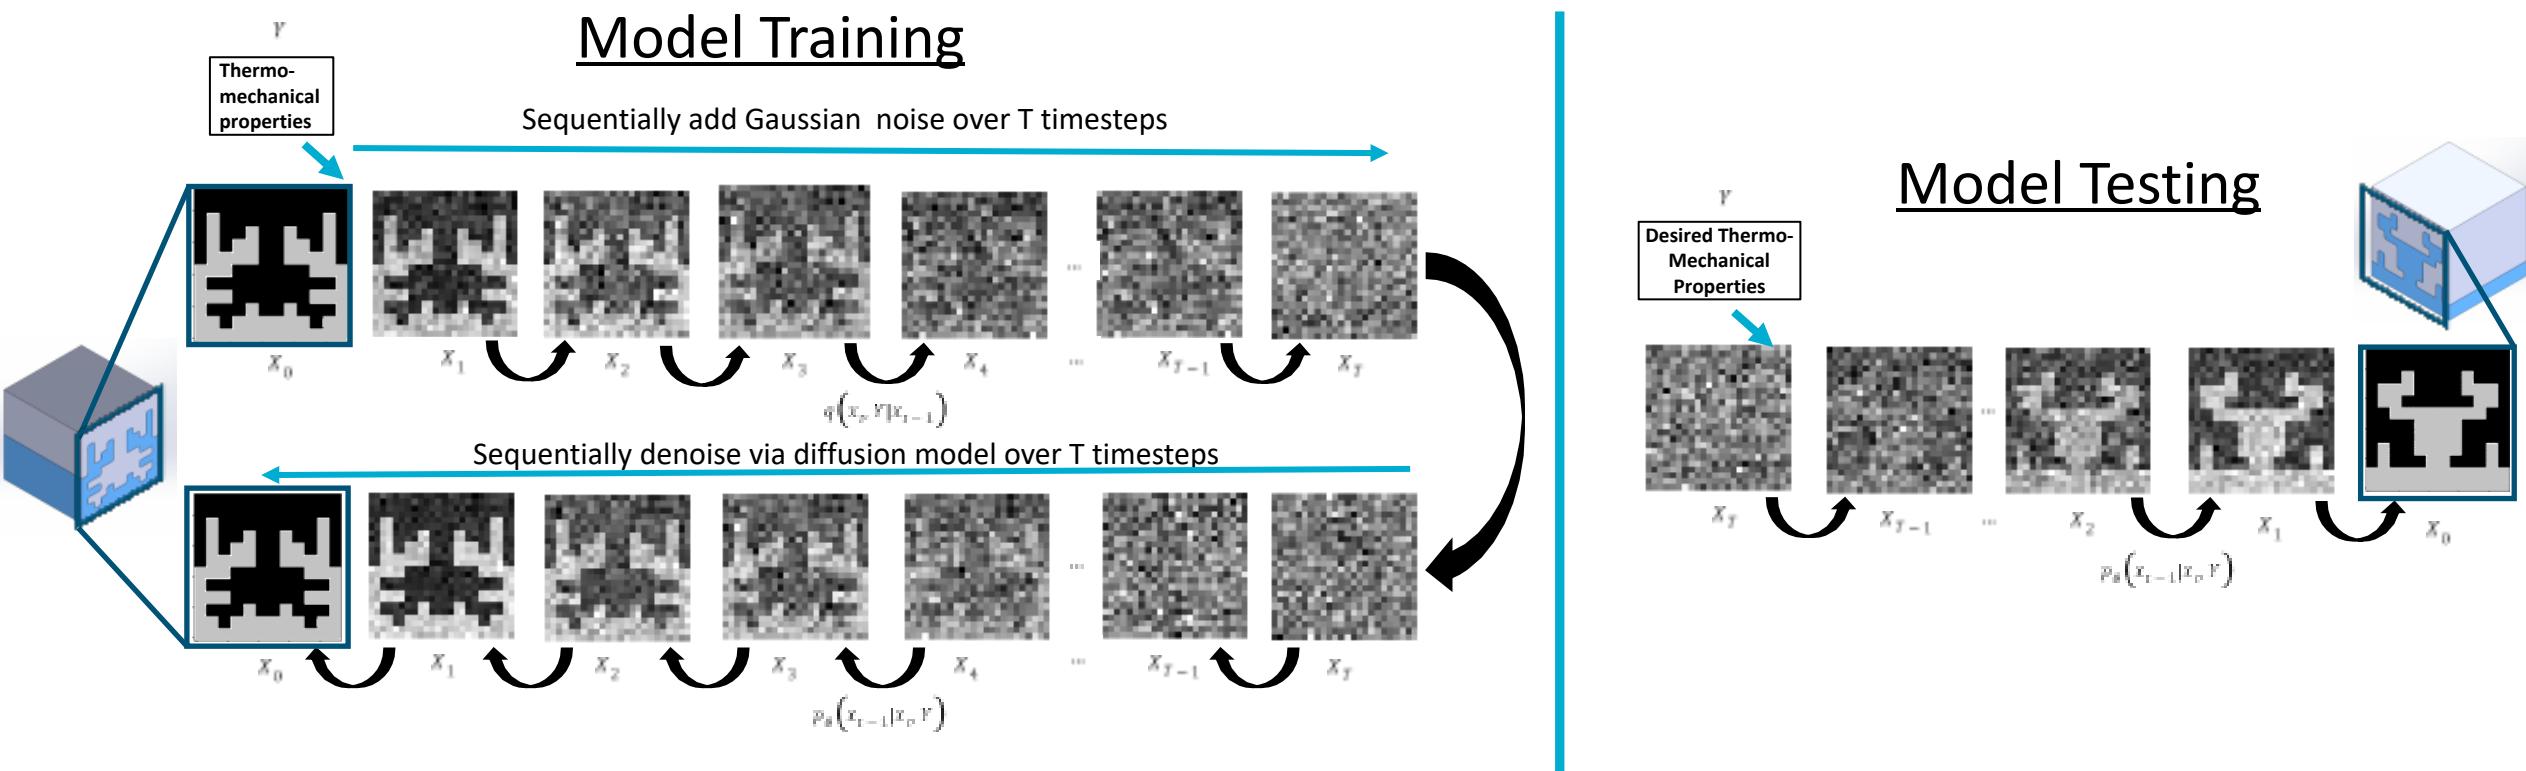

## (Gemini)

# CDMs as an Engineering Design Tool

- Use the denoising process to go from complete noise to a viable design candidate
- Replace “text-description” with performance criteria → Desired Thermo-mechanical properties

# Generating Training Data

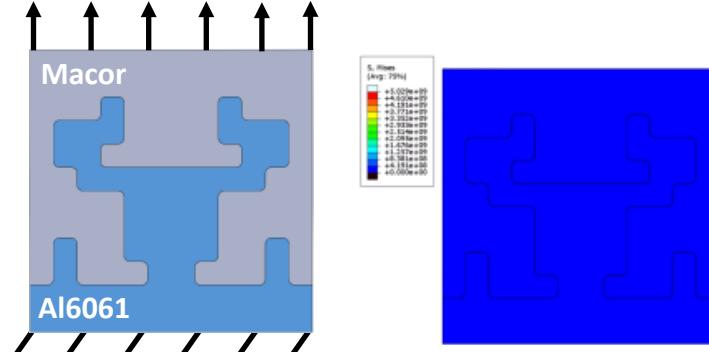

- Training data comprised of **ILM unit cell design and corresponding thermo-mechanical properties**
  - Randomly generated ~28k designs and determine properties using finite element analysis (FEA)
  - Voxelized 12x12 (mirrored) design domain, each element either *Macor*, *Al6061*, or void

## Thermo-Mechanical Properties

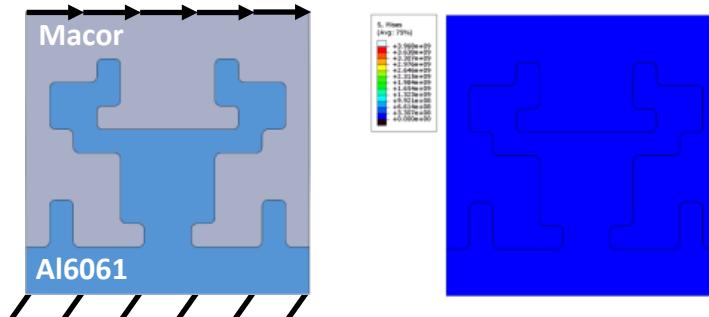

### *1. Tensile Resultant Force*

- Top surface resultant force at material yielding

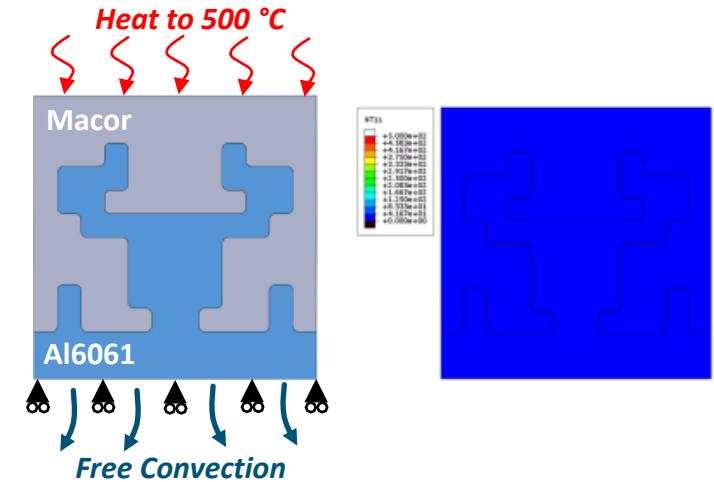

### *2. Shear Resultant Force*

- Top surface resultant force at material yielding

### *3. Heat Mitigation*

- Average bottom surface nodal temperature

# Putting the “Conditional” in CDM

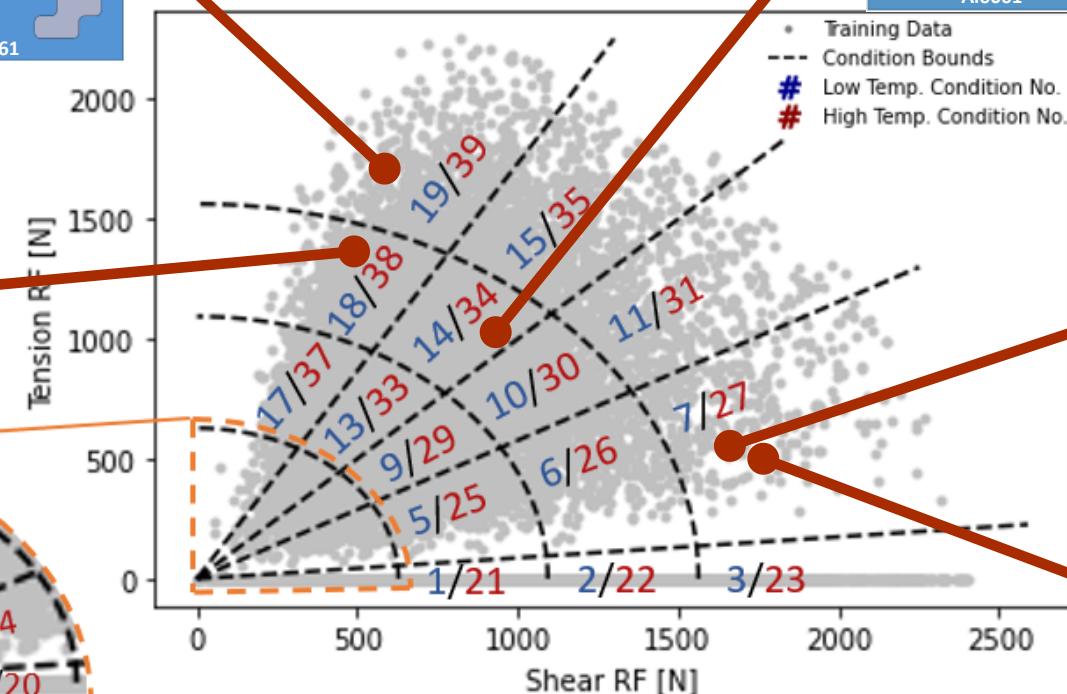

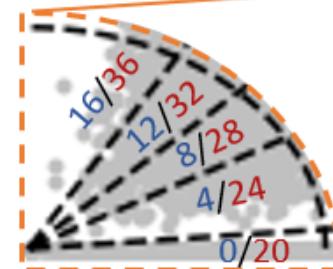

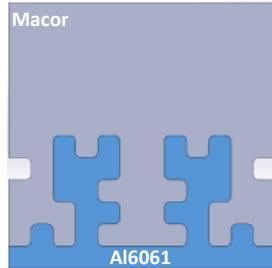

- 40 individual conditions numbers determined based on thermo-mechanical responses of 28k training samples
- Based on magnitude and ratio of tensile and shear resultant force and average bottom surface nodal temperature

Design 2 (Cond. No. 39)  
TRF: 1745 N SRF:566N Temp: 401

Design 1 (Cond. No. 18)

TRF: 1487 N SRF:515N Temp: 294

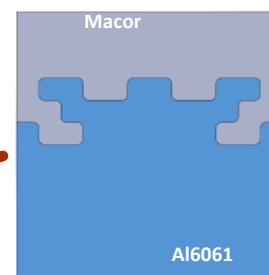

Design 3 (Cond. No. 14)  
TRF: 1050 N SRF:965N Temp: 315

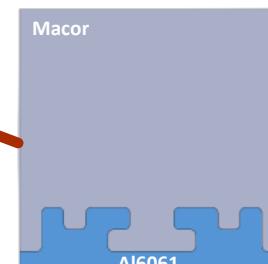

Design 4 (Cond. No. 27)

TRF: 491 N SRF:1659N Temp: 365

Design 5 (Cond. No. 7)

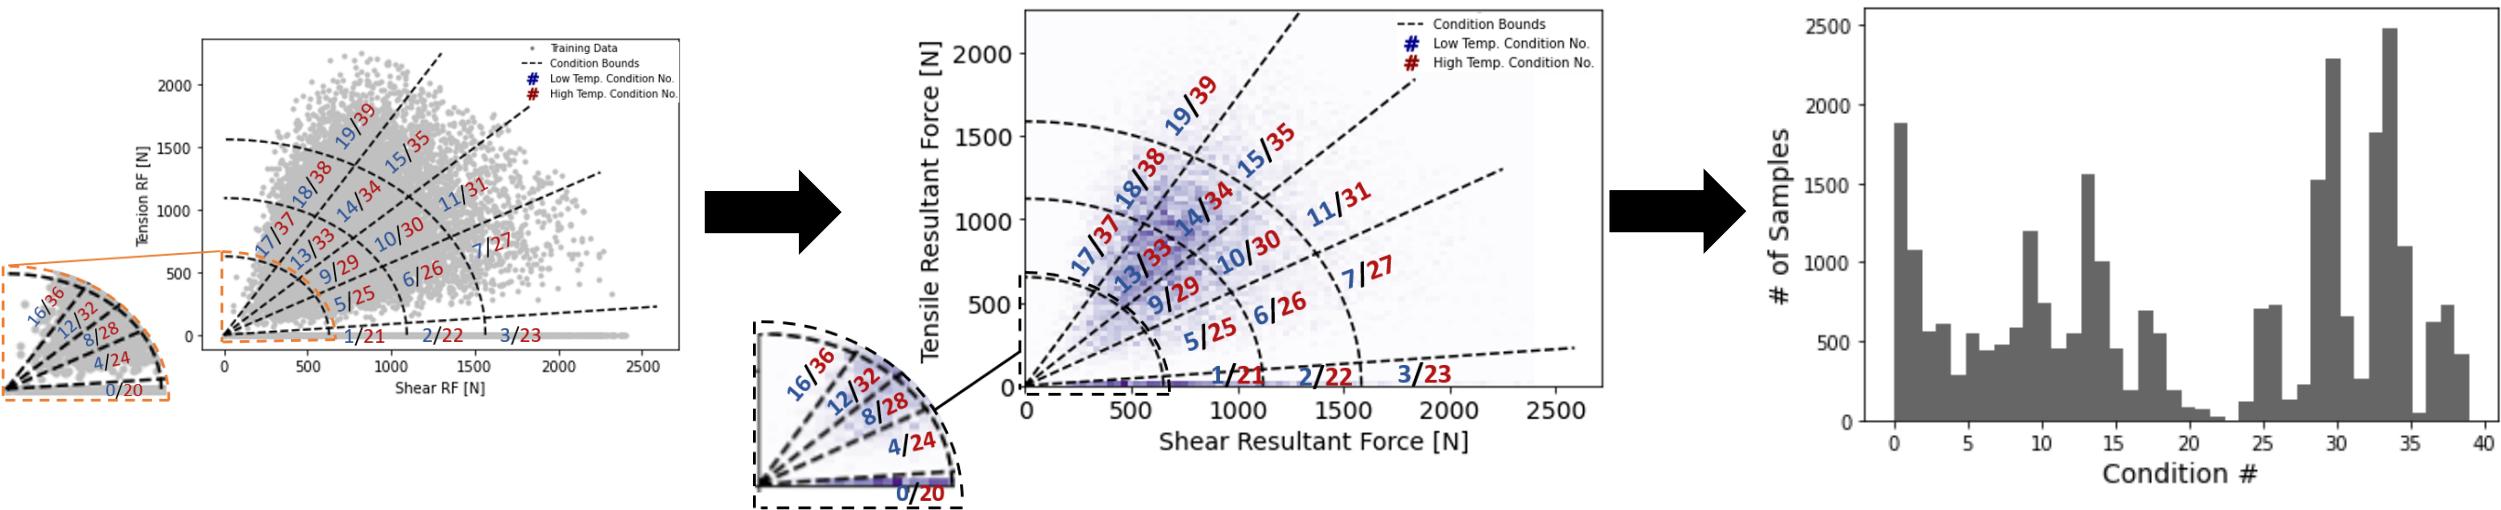

TRF: 384 N SRF:1789N Temp: 281

# Putting the “Conditional” in CDM

- **40 individual conditions numbers** determined based on thermo-mechanical responses of 28k training samples
- Based on magnitude and ratio of tensile and shear resultant force and average bottom surface nodal temperature

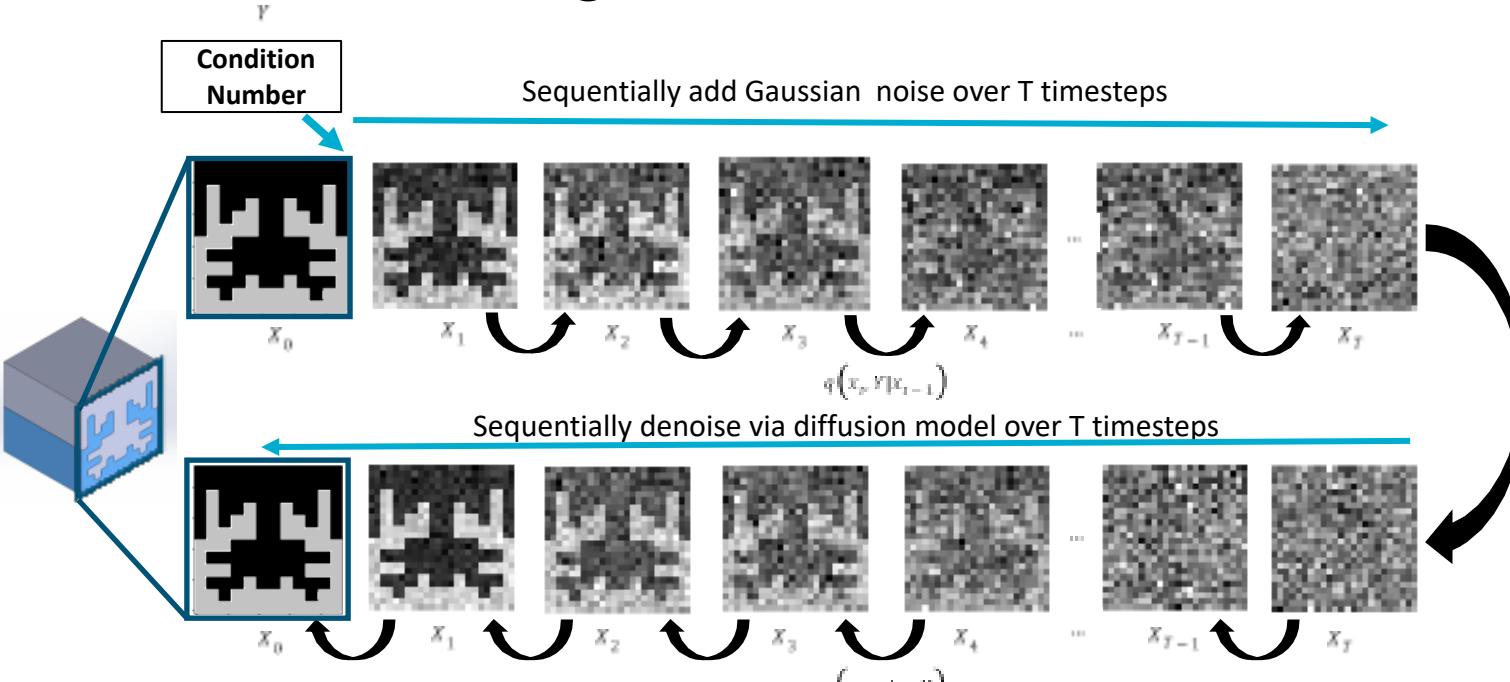

# CDMs as an Engineering Design Tool

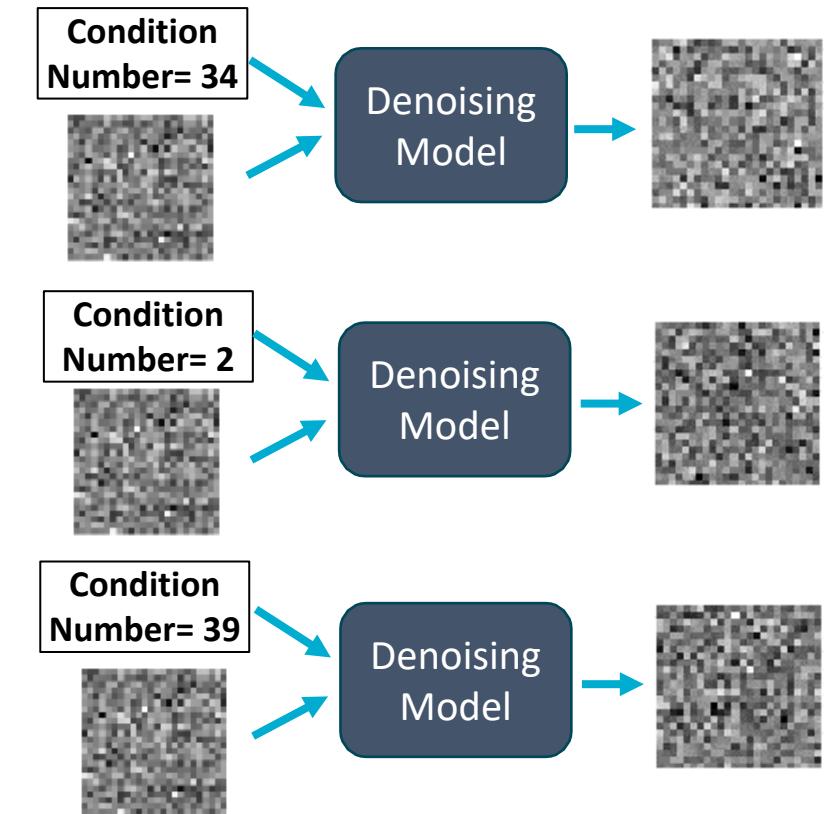

- Feed the 28k unit cell designs and accompanying condition number through the noising and denoising process

## Model Training w/ 28k randomly generated unit cells

## Model Testing

- Pick condition # based on desired thermo-mechanical properties

# Generalized Design Generation

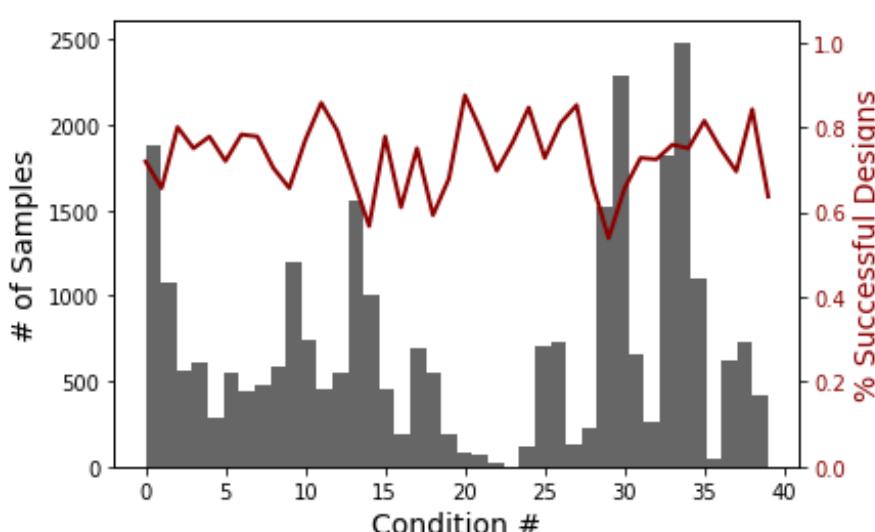

- The model was prompted to generate designs based on 1000 random condition numbers
  - Generate design via CDM → Tested Design via FEA → Compare FEA result to condition bounds

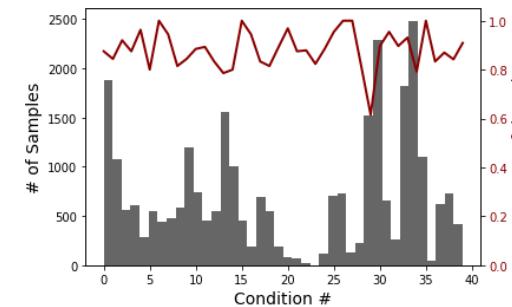

Conditions	Avg. Success Rate
All Conditions	73.3%
Angle	86.0%
Magnitude	88.2%
Thermal	95.6%

- The ability to achieve desired properties does not appear to be condition number dependent!

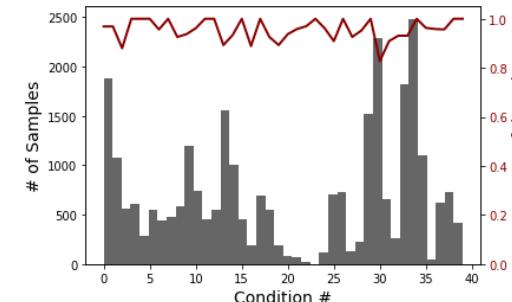

All Conditions

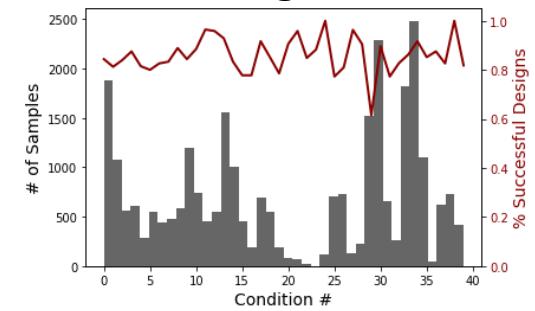

Magnitude

Heat Transfer

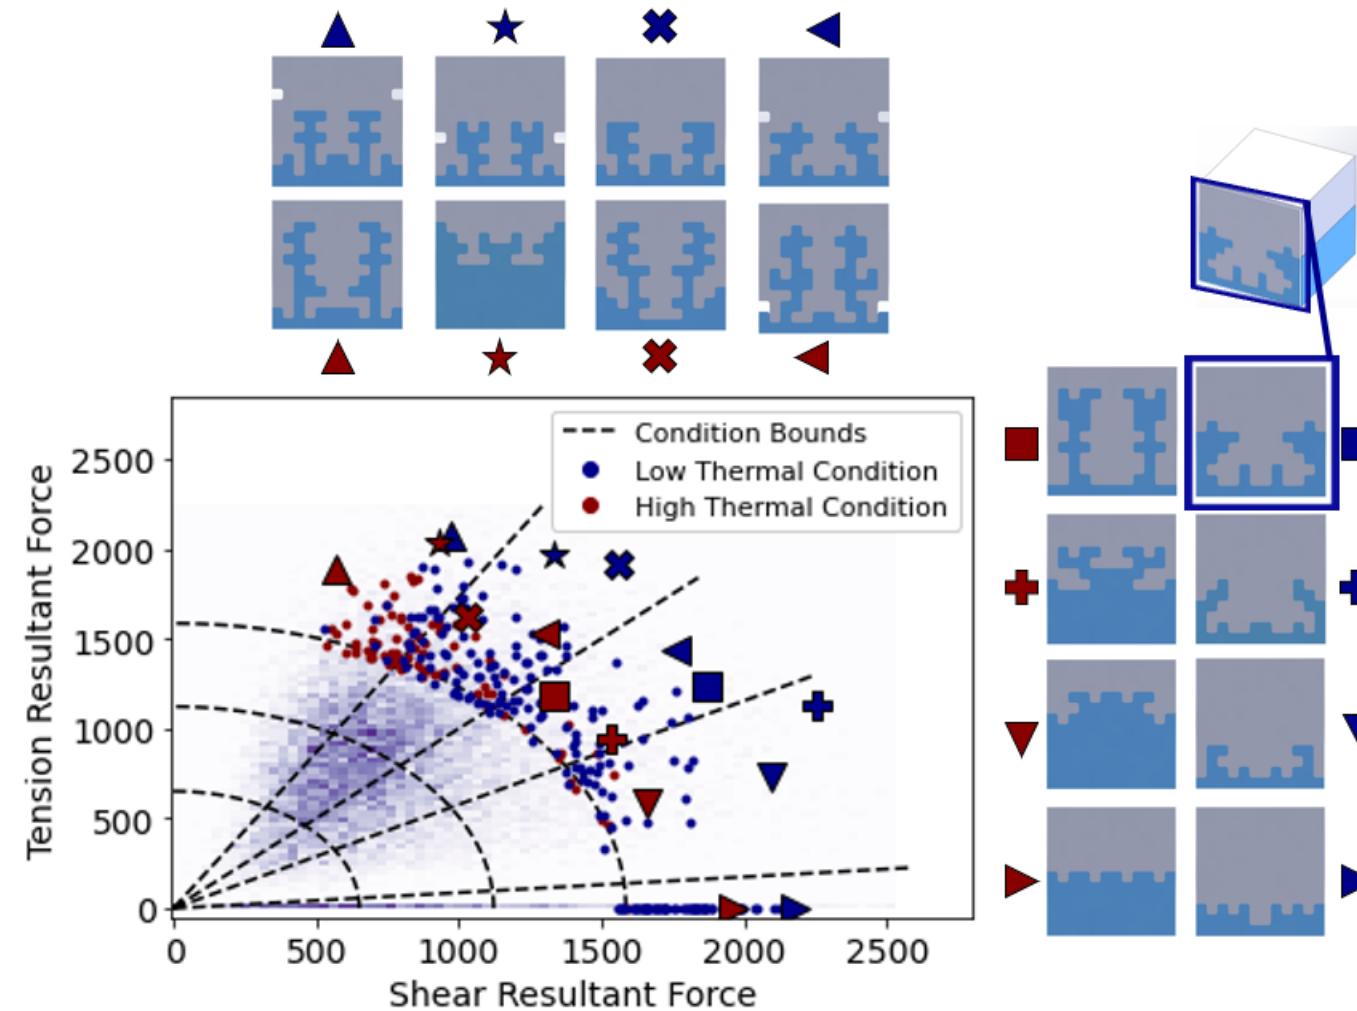

Angle

# “Pareto Front” Approach – 40 conditions

- Testing the model to produce extremes results in plethora of high performing design solutions
- Able to produce designs with high mechanical strength while satisfying various thermal responses

# Design Methodology Comparison

- Evaluate ILM unit cell performance and capabilities of 5 distinct methods

## Human Intuition

- Expertise
- Experiences
- Nature

## Parametric Opt

• Ge  
**Conclusion: The unit cells of ILMs can be optimized to achieve considerable increases in strength for various tessellation sizes**

## Genetic Algorithm

• Ge  
ntally Discrete  
xelized  
algorithm.  
ulating and  
mutations

## Conditional Conclusion

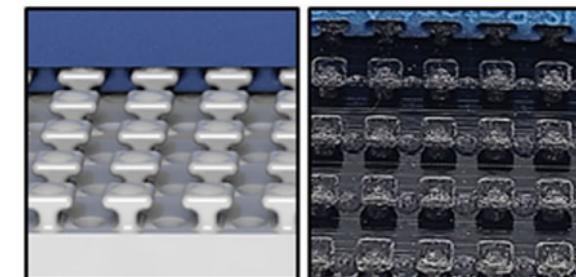

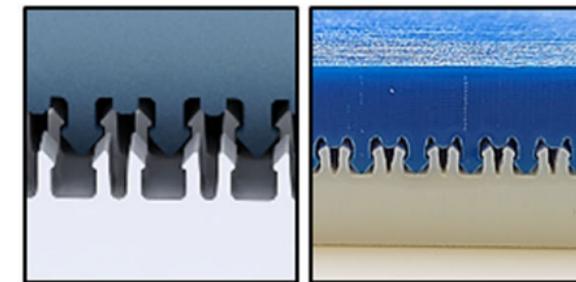

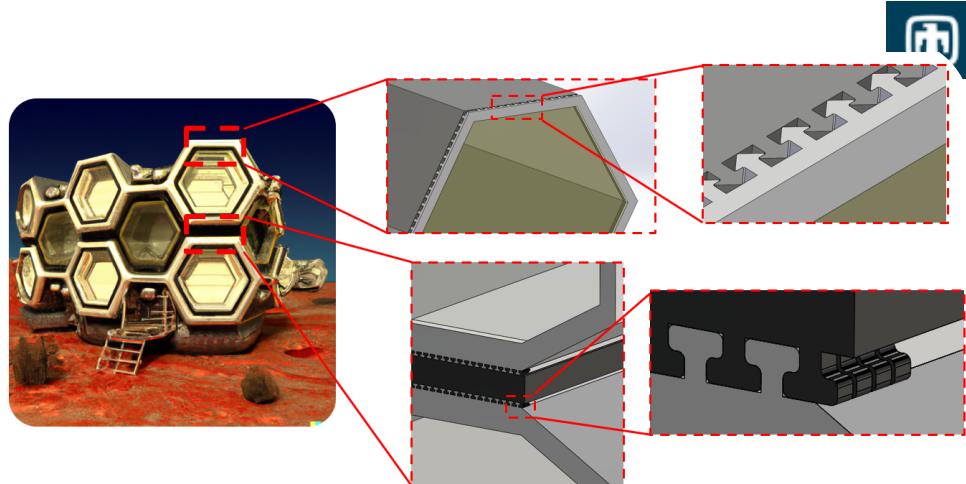

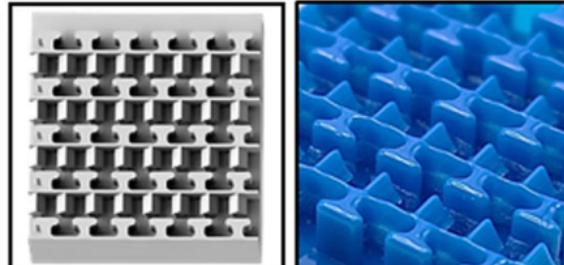

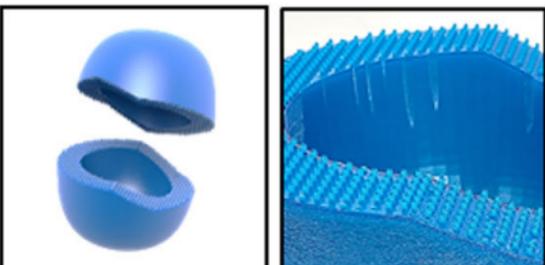

**Conditional Diffusion Models can serve as a generalized engineering design tool, accommodating design rules**

Direct design comparison in tension and shear, including experimental validation

Rapid unit cell generation with emphasis on rematability

# Conclusions

- Interlocking metasurfaces (ILMs) are a mechanically robust, non-permanent, environmentally durable alternative to traditional joining technologies
- ILMs' mechanical (and thermal) properties are dependent on feature topology
- ILMs can be optimized using a host of design methodologies
  - **Human intuition:** Fastest
  - **GA and PO:** Well established methods to achieve high performing solutions
  - **CDM:** Serve as generalizable tools for complex design

# Thank you!
