TABLE OF EIGENVALUES FOR PURE QUADRUPOLE SPECTRA, SPIN 5/2

Ralph Livingston and Henry Zeldes

INTRODUCTION

The table in this report contains eigenvalues for use in nuclear quadrupole spectroscopy for the spin $\frac{5}{2}$ case and allows asymmetries and quadrupole couplings to be obtained from experimentally measured frequencies. The roots of the spin $\frac{5}{2}$ secular equation¹

$$E^3 - (84 + 28\eta^2)E - 160 + 160\eta^2 = 0$$

have been calculated for preset values of η ranging from 0 to 1 in increments of 0.001, where η is defined in the usual way with respect to derivatives of the electric field along the principal axes directions,

$$\frac{(\partial E_x / \partial x) - (\partial E_y / \partial y)}{\partial E_z / \partial z}$$

Each of the roots has been multiplied by the factor $1/[4I(2I - 1)] = \frac{1}{40}$ for $I = \frac{5}{2}$; this gives tabular entries that can be applied to experimentally measured frequencies in a very direct manner, as outlined below.

The calculation was coded for the high-speed digital computer (the Oracle) at the Oak Ridge National Laboratory by the Mathematics Panel. E. C. Long and A. S. Householder handled the main burden of the work. The problem was coded so that for a given η value each of the three roots was separately calculated and then tested to see that the three summed to zero, as required by the secular equation, before the next η value was used. As a further check, the entire calculation was performed twice, and the output tapes were compared. The calculations are tabulated essentially as they were printed from the machine output tape, so as to involve a minimum of labor and eliminate chances of error. Consequently, some interpretation of the printed numbers is required, as explained below.

USE OF THE TABLE

The numbers in the E_1 , E_2 , E_3 , and R columns must be interpreted as follows:

1. The last digit (zero) is not significant and should be ignored.
2. All entries are the significant figures after the decimal point; hence every entry should be regarded as having a decimal point preceding it.
3. Although the entries are used for magnitudes of couplings, E_1 and E_2 must be regarded as having the same sign, and E_3 as having the opposite sign. Thus

$$E_1 + E_2 + E_3 = 0$$

for every value of η .

4. Unity should be added to every value in the R column. Thus the value of R for $\eta = 0$ is 1.999999999 or 2; R is the magnitude of $(E_3 - E_2)/(E_2 - E_1)$.

The following example should make the use of the table clear. An iodine ($I = \frac{5}{2}$) quadrupole resonance in a crystalline solid was found to have resonant frequencies at 202.8696 and 325.8298 Mc. The frequency ratio is 1.6061046. The R column immediately gives $\eta = 0.451$. The magnitude of the z component of the coupling is found by dividing 202.8696 Mc by $|E_2 - E_1| = 0.180087105$, giving 1126.508 Mc, or, alternatively, by dividing 325.8298 Mc by $|E_3 - E_2| = 0.289238701$, giving 1126.508 Mc, the same answer as before. In the above example the frequencies were adjusted so that interpolation was not needed.

¹See, for example, R. Bersohn, *J. Chem. Phys.* 20, 1505 (1952).
