1. EXECUTIVE SUMMARY

The Environmental Protection Department/ Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During first quarter 1991 (January through March), EPD/ EMS conducted routine sampling of monitoring wells and drinking water locations.

EPD/EMS established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels; instead, they aid personnel in sample scheduling, interpretation of data, and trend identification. Beginning first quarter 1991, the flagging criteria are now based on EPA drinking water standards and contract detection limits. A detailed explanation of the current flagging criteria is presented in the **Flagging Criteria** section of this document.

All analytical results from first quarter 1991 are listed in this report, which is distributed to all site custodians. One or more analytes exceeded Flag 2 in 90 monitoring well series. Analytes exceeded Flag 2 for the first time since 1984 in 38 monitoring well series.

Those sites with constituents in the groundwater above Flag 2 in first quarter 1991 are listed in Table 1, organized by location and well series. Results from all laboratory analyses above Flag 2 are used to generate this table. (In quarterly reports prior to the Third Quarter 1988 Report, the table was generated using data only from the former primary laboratory, Envirodyne Engineers.) Also, specific conductance and pH data from the field are included in this table. (In quarterly reports prior to the Third Quarter 1988 Report, the table was generated using specific conductance and pH data only from the laboratory.)

NOTES

2. INTRODUCTION

This report summarizes the SRS groundwater monitoring program conducted by EPD/EMS in the first quarter of 1991. It includes the analytical data, field data, data review, quality control, and other documentation for this program, provides a record of the program's activities and rationale, and serves as an official document of the analytical results.

EPD/EMS is responsible for monitoring for constituents in the groundwater at approximately 135 waste sites in 16 areas at SRS (see Figures 1 and 2, pp. 14–15). The majority of this monitoring is required by U.S. Department of Energy (DOE) orders and by federal and state regulations administered by the U.S. Environmental Protection Agency (EPA) and the South Carolina Department of Health and Environmental Control (SCDHEC). The groundwater monitoring program includes the following activities:

- installation, maintenance, and abandonment of monitoring wells
- environmental soil borings
- development of the sampling and analytical schedules
- collection and analyses of groundwater samples
- review of analytical and other data
- maintenance of the databases containing groundwater monitoring data
- quality assurance (QA) evaluations of laboratory performance
- reports of results to waste-site facility custodians and to the Environmental Protection Section (EPS) of EPD

EPD/EMS is responsible for monitoring wells but not for the facilities that are monitored. It is the responsibility of the custodian of each waste site to ensure that EPD/EMS is informed of sampling requirements and special requests for the sampling schedule, to assist in reviewing the data, and to make any decisions regarding groundwater monitoring at the waste site.

Each custodian receives a copy of this report; also, each custodian receives site-specific data upon request, including the following:

- a computer printout of the analytical data for this quarter and for the previous seven quarters, designed to assist in identifying trends
- a computer printout of analytical values at or above Flag 1 and Flag 2 criteria for the quarter, designed to assist in identifying elevated analytical values

ORGANIZATION OF THIS REPORT

This report is divided into sections that focus on specific aspects of the SRS groundwater monitoring program. The **Executive Summary** section presents a tabular listing by waste site and well series of all analytes detected at or above Flag 2 criteria during the quarter. Analytes detected at or above Flag 2 criteria for the first time since 1984 are indicated in bold type. The flagging criteria were revised during first quarter 1991. The **Corrections** section lists omissions and corrections to previous quarterly reports.

The next four sections address the sampling and assessment of groundwater quality at SRS. The **Sample Scheduling** section discusses the preparation of the sampling schedule and the criteria for analyte selection, including flagging criteria.

INTRODUCTION

During sample collection, samplers often write comments in the field-data books that may be pertinent to the analysis of the sample. Many of the comments concern the appearance of water that is colored or turbid and wells that went dry during sampling. These comments are given in the **Sample Collection** section.

Samples are analyzed by the EPD/EMS and M-Area laboratories at SRS and by two off-site laboratories, General Engineering and IT Analytical Services. The **Analytical Data Review** section contains two subsections. The **Review of the Analytical Data for Errors** is a discussion of discrepancies in each laboratory's analytical data, including results that are considerably higher or lower than previous results, analyses that were omitted, blanks that showed elevated results and their associated samples, and samples that were held past the allowable holding time. The **Analytical Methods** subsection lists the methods that General Engineering and IT Analytical Services laboratories used for measuring concentrations of each analyte.

A select number of replicate samples are analyzed by the off-site laboratories as part of the EPD/EMS quality control program. The **Quality Control Samples** section contains four subsections. The **Replicate and Duplicate Analyses of Samples** subsection explains the replicate analysis program, gives the statistical methods used for comparison, and lists the results of the comparisons. The **Comments on the Replicate and Duplicate Analyses** subsection discusses the replicate and duplicate analyses comparison results and their meanings. The accuracy of analyses is tested using solutions with known analyte concentrations; the results and percentages of accuracy are found in the **Quality Control Standards** subsection. The **Blanks** subsection lists analytical results of laboratory tests on samples of deionized water to aid in determining if constituents were in the rinsewater, in sample containers, or introduced during analysis.

The **Flagging Criteria** section lists flagging criteria for analytes and provides short descriptions of how the criteria were derived. The **Analytical Results** section includes tables listing all the analytical results from all the laboratories and field data for all wells sampled during the quarter. The tables are listed in alphabetical order by well name. The **Water-Level Data** section includes field data obtained for a special project on concurrent water elevations in the A/M Areas; these data are used by site custodians in hydrogeologic interpretation.

The **Site Index by Well Series** assists the reader in finding the site names. A glossary of abbreviations and acronyms used in this report can be found in the **Glossary** section. References cited in this and previous quarterly reports are listed in the **References** section.

NOTES

3. CORRECTIONS

In previous quarterly reports, all analyses of alkalinity should have been reported as $CaCO_3$.

The term *phenols* previously has been used incorrectly to refer to the specific Appendix IX and Priority Pollutants constituent phenol, as well as correctly for the class of compounds analyzed as part of comprehensive analyses. Beginning this quarter, phenol and phenols are reported separately.

Results for benzo[*b*]fluoranthene have sometimes been reported as benzo bifluoranthene due to metaTRACE's use of an incorrect test code.

CORRECTIONS TO THE THIRD QUARTER 1990 REPORT (ESH-EMS-900133)

The units for alkalinity reported in the field data of the **Analytical Results** section were erroneously reported as meq/L, but should have been reported as mg/L.

CORRECTIONS TO THE FOURTH QUARTER 1990 REPORT (ESH-EMS-900134)

The units for alkalinity reported in the field data of the **Analytical Results** section were erroneously reported as meq/L, but should have been reported as mg/L.

Due to a printer problem, the letter S was replaced by T, and the letter T was omitted, on pp. 191, 194, 197, 205, and 206 of the **Analytical Results** section.

NOTES

4. SAMPLE SCHEDULING

The SRS groundwater monitoring program conducted by EPD/EMS is scheduled according to comprehensive analyses, flagging criteria, indicator parameters, regulatory requirements, and special requests. This information is used to generate *The Savannah River Site's Groundwater Monitoring Program 1991 Sampling Schedule*. The scope of this program showing the breakdown of analyses by laboratories for first quarter 1991 is demonstrated in Figure 3.

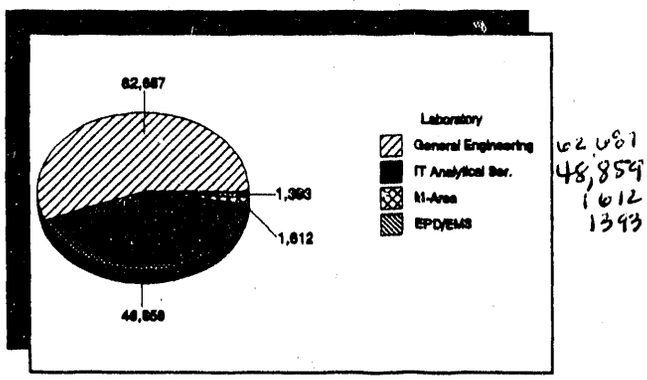

Figure 3. The Number of Analyses Performed During First Quarter 1991

COMPREHENSIVE ANALYSES

All new wells are automatically scheduled for 4 quarters of comprehensive analyses (arsenic, barium, cadmium, calcium, chloride, chromium, fluoride, gross alpha, iron, lead, magnesium, manganese, mercury, nitrate as nitrogen, non-volatile beta, pH, phenols, potassium, selenium, silica, silver, sodium, specific conductance, sulfate, total dissolved solids, total organic carbon, total organic halogens, total phosphates [as P], total radium, and tritium) when they are first sampled as part of the groundwater monitoring program. Herbicide/pesticide analyses are only scheduled during the first quarter of sampling in conjunction with comprehensives.

Comprehensive analyses and herbicide/pesticide analyses are scheduled every 2 years after the initial 4 quarters for each well series. Wells that are exclusively sampled for radionuclide analyses are not included in these biennial comprehensive analyses.

FLAGGING CRITERIA

Wells are grouped for scheduling by the site monitored or investigation for which they are being used. If any well in a scheduling group has an analyte detected above a flagging level, the entire well group is assigned a flagging value for that analyte. The flagging values are 0, 1, or 2. Analytes detected at Flag 0 do not trigger scheduling. Analytes detected at or above Flag 1 are scheduled to be analyzed once a year (first quarter), and those detected at or above Flag 2 are scheduled to be analyzed twice a year (first and third quarters). Criteria for Flag 1 and Flag 2 designations are listed in the **Flagging Criteria** section of this report.

Certain wells in the A/M Areas are sampled by special request for GC VOA by the M-Area Laboratory as part of the groundwater monitoring program. If any of these wells yield an analyte equal to or exceeding Flag 2, GC VOA analysis is scheduled for an off-site laboratory for verification.

Flags are cleared from the schedule using the following rules. If an analyte from a well is scheduled as Flag 2 and yields three subsequent results that do not equal or exceed Flag 2, then the flag for that analyte in that well is reduced to Flag 1. Similarly, if an analyte from a well is scheduled with Flag 1 and yields three subsequent results less than Flag 1, then the flag for that analyte is removed from the schedule.

SAMPLE SCHEDULING

INDICATOR PARAMETERS

When any one of the six constituents of the herbicide/pesticide suite (2,4-dichlorophenoxy-acetic acid, endrin, lindane, methoxychlor, toxaphene, and silvex) is flagged, the entire suite is flagged for analyses according to the conventional flagging scheme. The GC VOA and GCMS VOA suites follow the same rule as the herbicide/pesticide suite; if one compound is flagged, the whole suite of GC VOA or GCMS VOA analytes is flagged.

The GC VOA suite is encompassed in the GCMS VOA suite, and analyses are scheduled in an effort to avoid duplication of the GC VOA analyses and unnecessary analysis of GCMS VOA compounds. For example, if only GC VOA compounds are equal to or exceed Flag 1, GC VOA is scheduled for Flag 1 analysis. Likewise, if only GC VOA compounds exceed Flag 2, GC VOA is scheduled for Flag 2 analysis. If GC VOA compounds exceed Flag 2 and the other GCMS VOA compounds exceed Flag 1 only, GCMS VOA analysis is scheduled for 1 quarter and GC VOA analysis is scheduled for a different quarter. This allows the GC VOA compounds to be analyzed twice, fulfilling the Flag 2 requirement.

Twice a year, GCMS VOA analysis is scheduled for individual wells that have had two results for total organic halogens (TOH) greater than 10 μg/L (excluding the first TOH analysis) and have never received GCMS VOA analysis.

REGULATORY REQUIREMENTS

All regulatory requirements such as RCRA requirements are scheduled by special request.

SPECIAL REQUESTS

Many other analyses are scheduled because of special request from various SRS groups. The person or group requesting the analyses must submit a sampling request form to EPD/EMS. If the request is within the scope of the groundwater program and is included in the current laboratory contract, the analyses will be added to the sampling schedule.

5. SAMPLE COLLECTION

Sample collection was performed by EPD/EMS personnel and Ge-Hy Environmental Sampling of New Ellenton, SC.

Each sampler maintained a field notebook. These field books are located in the first quarter 1991 section of the EPD/EMS Groundwater Monitoring Library. Field measurements were taken for alkalinity, pH, temperature, specific conductance, air temperature, depth to the water prior to pumping, and volume of water pumped prior to sampling.

All sample collections were routine during the first quarter of 1991, except as indicated in Table 2. The samplers' observations about the water sample, well condition, and any special method of collecting are noted in the table. All wells were pumped, except for the wells from the following series, which were bailed: F, FAC, the FCA series except FCA 19D, FTF, H, HTF, MGA, MGC, MGE, MGG, RSA, RSB, RSC, RSD, RSE, SSS, and the ZW series. The following individual wells were also bailed, although the other wells in the series were pumped: BG 52, BG 67, BG 121, BG 125, CSD 1D, K 301P, MSB 13C, MSB 15C, MSB 17C, MSB 44C, SCA 3A, Z 9, ZBG 1A, and SCA 4A.

Sampling events can cover up to 24 hours. For example, if a well is pumped dry before a sample is collected and the well is revisited within 24 hours, this is considered one sampling event. If the second visitation is made after 24 hours, this is considered a separate sampling event. For those wells that required a second visitation, only the volume purged before the well went dry is given in this section. The total amount of water purged from each well in one sampling event is given in the **Analytical Results** section for each sampling event.

Additional comments about dry wells, continuously pumping wells, and malfunctioning wells can be found in the **Analytical Results** section.

6. ANALYTICAL DATA REVIEW

The following laboratories performed the sample analyses for EPD/EMS during first quarter 1991. All analyses were conducted by EPA-approved methods except as noted in Table 18 on page 64.

General Engineering (GE) of Charleston, SC, and IT Analytical Services (IT) of St. Louis, MO, the primary SCDHEC-certified subcontracting laboratories for sample analysis, performed all analyses, with the following exceptions:

- The M-Area Laboratory (MA) at SRS performed chloroform, tetrachloroethylene, trans-1,2-dichloroethene, 1,1-dichloroethylene, trichloroethylene, and 1,1,1-trichloroethane analyses for certain wells in the A/M Areas.

- The EPD/EMS Laboratory (EM) operated by EPD/EMS at SRS conducted total activity analyses of samples for shipping clearance. The EPD/EMS Laboratory also conducted tritium, gross alpha, nonvolatile beta, and selected radionuclide analyses of samples from specified well series.

Both GE and IT performed analyses of gross alpha, nonvolatile beta, tritium and total radium; IT performed most other scheduled radioisotope analyses.

REVIEW OF THE ANALYTICAL DATA FOR ERRORS

EPD/EMS reviews analytical data from the laboratories for errors and unusual results before entering this information into the database. All suspect data are brought to the attention of the laboratories for review, corrections, and comments. Types of errors that were corrected include the following:

- Several well names and sample dates were incorrect in the analytical and field data.

- Several laboratory sample identifications were assigned incorrect well names.

- Several analytical units, analytical methods, run dates, and detection limits were entered incorrectly.

- Several analytical results appeared different from historical data collected since 1988. A review of the laboratory records revealed problems with some of these analyses, such as data entry errors or incorrect dilution factor calculations. The original values were corrected in the data files by EPD/EMS after receiving written notification from the laboratory.

Specific details concerning the corrections can be found in the *EMS Groundwater Monitoring Program Changes to the Database Log Book*, where the corrections are also recorded.

The laboratories notify EPD/EMS when analyses are performed out of holding time, since this affects the reliability of the data.

Well names followed by (R) in the tables in this and the following section (**Quality Control Samples**) indicate a blind replicate sent by EPD/EMS to one or more of the laboratories. If a statement in these chapters is true of both the well under its own name and its replicate, only the well name is used.

Samples from RSA 10, RSB 7, RSD 1, RSE 9, and RSE 10 were analyzed past the 7-day holding time for total organic halogens because the laboratory received the samples after the holding time expired.

Samples from AMB 7, FCB 3, MSB 16A, MSB 38B, MSB 38C, and MSB 38TA were extracted past the 7-day holding time for herbicides, although the laboratory received the samples before the holding time expired. In addition, samples from FSB 78B, KAC 1, and HAC 2 should be treated as suspicious due to surrogate failure. The duplication of these samples for quality control left insufficient sample for reextraction.

Samples from the following 6 wells were extracted for pesticides past the 7-day holding time, although the laboratory received the samples before the holding time expired: FCB 3, MSB 24A, MSB 25A, MSB 27, MSB 27B, and MSB 32.

Samples from the following 132 wells were analyzed past the 48-hour holding time for total phosphates as phosphorus, although the laboratory received the samples before the holding time expired.

Samples from the following 7 wells were analyzed after the 7-day holding time for total dissolved solids expired because the earlier analyses did not meet quality control criteria: IDB 1A, IDB 2B, IDB 2C, IDP 1, IDQ 3A, KDB 1, and KDB 2.

Samples from the following 11 wells were analyzed past the 48-hour holding time for nitrite as nitrogen, although the laboratory received them before the holding time expired: BG 94, BG 95, BG 96, CSD 1D, FSS 1D, FSS 2D, FSS 3D, FSS 4D, HSS 1D, HSS 2D, and HSS 3D, as well as the spike for IDQ 5.

Samples from the following 34 wells were analyzed past the 28-day holding time for nitrate as nitrogen, although the laboratory received them before the holding time expired.

A need for reanalysis caused the sample for ASB 6AA to be analyzed past the 14-day holding time for GC VOA, although the laboratory received the sample before the holding time expired.

Samples for KDT 1D and TBG 6 were analyzed past the 14-day holding time for GCMS VOA, although the laboratory received the samples before the holding time expired.

The internal laboratory blanks in Table 3 showed elevated results. General Engineering confirmed these results after review of the laboratory's records. The samples that accompanied the laboratory blanks in their respective analytical batches are listed in the table.

The sample for sulfide from LFW 22 was analyzed after the 7-day holding time, although the laboratory received it before the holding time expired.

Samples from FSB 94C, HSB145C, HSB145D, and NBG 2 were analyzed or reanalyzed past the 14-day holding time for GCMS VOA, although the laboratory received the samples before the holding time expired. In addition, FSB 76B(R) and FSB 76C were reanalyzed 1 day outside holding time for an unspecified reason, and HSB131D was reanalyzed late due to a high surrogate recovery.

Samples from MSB 47C and MSB 72B were analyzed after the 14-day holding time for GC VOA, although the laboratory received them before the holding time expired.

Samples from the following 194 wells were analyzed past the 7-day holding time for total dissolved solids, although the laboratory received the samples before the holding time expired.

Samples from ABP 1A(R) and BGO 15D were extracted for bases/neutrals/acids after the 7-day extraction time, although the laboratory received the samples before the holding time expired.

Samples from the following 18 wells were analyzed past the 28-day holding time for chloride, fluoride, and sulfate, although the laboratory received the samples before the holding time expired.

In addition, DBP 2 was reanalyzed outside of holding time.

Samples from CSD 12D, DCB 6, and DCB 7 were analyzed past the 28-day holding time for dissolved organic carbon, although the laboratory received the samples before the holding time expired.

The sample from LFW 22 was analyzed past the 28-day holding time for iodine, although the laboratory received the sample before the holding time expired.

Samples from the following 5 wells were analyzed past the 28-day holding time for nitrate, although the laboratory received the samples within the holding time: BRR 1D, FNB 4(R), FSB 76A, FSB 76C, and SBG 2. In additional, BGO 32D and MSB 55C were reanalyzed outside of holding time for an unspecified reason.

The samples from the following 6 wells were extracted past the 7-day holding time for pesticides, although the laboratory received the sample before the holding time expired: BGO 15D, BGO 28D, FCA 19D, KSB 3, KSB 4A, and HSB138D.

Samples from BG 94 and DCB 7 were analyzed past the 28-day holding time for total carbon and for inorganic carbon, although the laboratory received the samples before the holding time expired.

The samples from the following wells were filtered before being analyzed for gross alpha: FTF 4, FTF 7, FTF 18, FTF 24A, FTF 25A, FTF 26, and FTF 27.

IT Analytical Services was unable to obtain accurate results for cerium-141 when analyzed with uranium-235, due to interference, for wells FSB 79C and FSB110D.

Matrix interference caused differing chloride values between sample FSB105C and its laboratory duplicate.

The following internal laboratory blanks showed elevated results. These results were confirmed by IT Analytical Services after review of the laboratory's records. The samples that accompanied the laboratory blanks in their respective analytical batches are listed in Table 8. Sample ERA191P is a purchased quality control standard.

A technical review of the quarter's radioactive results identified the analyses in Table 15 as high in comparison to historical data. A review of the EPD/EMS Laboratory records did not reveal any problems with the analyses. No review of the records was done on total activity analyses, as records had been turned over to the Groundwater group.

Analyte	Wells
Nonvolatile beta	RCS 3, RSE 2, RSE 4A, RSE 4C, RSE 13, RSE 19

Tritium	BG 52, MGG 36

A technical review of the quarter's radioactive results identified the analyses in Table 16 as low in comparison to historical data. A review of the EPD/EMS Laboratory records did not reveal any problems with the analyses. Total activity results were not reviewed, as hardcopy records had been turned over to the Groundwater group.

ANALYTICAL METHODS

Laboratories performed analyses using the EPA methods listed in Table 18, with the following exceptions:

- The EPD/EMS Laboratory at SRS conducted selected radionuclide analyses of samples required by the groundwater monitoring program. The gross alpha and nonvolatile beta analytical methods used by the EPD/EMS Laboratory are in-house methods based on applicable EPA methods. Methods used by EPD/EMS for testing other radioisotopes are also in-house analytical methods. The EPD/EMS Laboratory radioactivity determinations are reported as the absolute concentrations calculated from the analytical tests.

- The M-Area Laboratory at SRS analyzes certain wells in the A/M Areas only for chloroform, tetrachloroethylene, trans-1,2-dichloroethene, 1,1-dichloroethylene, trichloroethylene, and 1,1,1-trichloroethane by EPA methods 601 (Gas Chromatography) and 624 (Gas Chromatography/Mass Spectrometry).

- Methods that are not EPA methods are referenced in the footnotes in Table 18.

For each method and analyte, the detection limit given is equal to or higher than the detection limit used for at least 90% of the analyses.

If more than one analytical method is listed for one analyte, the methods are listed in descending order according to which method was used most often. Generally, the method listed first was used for at least half of the analyses.

7. QUALITY CONTROL SAMPLES

REPLICATE AND DUPLICATE ANALYSES OF SAMPLES

Blind replicate samples and duplicates are analyzed by the primary laboratories, General Engineering (GE) and IT Analytical Services (IT), in order to satisfy quality assurance standards. For intralaboratory comparisons, each laboratory generally analyzes 10% of the samples in duplicate. In addition, EPD/EMS sends blind replicates of approximately 5% of the total samples to both laboratories for analysis. The results of the blind replicate analyses are used for both intralaboratory and interlaboratory comparisons.

The replicate and duplicate analytical results are used to generate Mean Relative Difference (MRD) indexes, which are used along with *t*-test results (Steel and Torrie, 1980) to evaluate the laboratories' performance. All of these results are included in the **Analytical Results** section of this report. Results from duplicate samples are included in the main table for a given well and sample date. Results from analyses of replicate samples, and from any duplicate analyses made on the replicates, are reported in a second table for the same well and sample date.

Table 19 lists the names and sample dates of the wells that were used as blind replicates for General Engineering and IT Analytical Services.

QUALITY CONTROL SAMPLES

Certain analytes were not present in concentrations above detection limits at either laboratory in any well samples having replicates or duplicates. These analytes, listed in Table 20 with each laboratory's reference detection limit (RDL), which is the 90th percentile value from the array of detection limits, are not considered in further evaluation of replicate and duplicate analysis.

Intralaboratory Comparisons

There are two types of intralaboratory comparisons: in-house duplicate and blind replicate. The MRD, devised by EPD/EMS personnel to assess the reproducibility of identical chemical analyses, is calculated as

$$MRD = \left\{ \frac{\sum_{i=1}^{n} \left(|x_i - y_i| \,/\, [(x_i + y_i)/2] \right)}{n} \right\} \times 100,$$

where

x_i = an analyte's concentration in a water sample for the i^{th} well,

y_i = the analyte's concentration in the replicate or duplicate, and

n = the number of pairs of observations.

For the in-house duplicate comparisons, the quantities x_i and y_i represent the results for the original sample and the in-house duplicate, respectively. For the blind replicate comparisons, x_i and y_i represent the results for the known sample and the EPD blind replicate, respectively.

For both intralaboratory comparisons, the MRD is defined as the average absolute difference between an original sample and its duplicate or blind replicate expressed as a percentage of the mean of those two values. Generally, the closer the original results and their replicate or duplicate results are to each other, the lower the MRD.

Normalizing Data to the RDL

Because some detection limits may be anomalously high (due to dilution or other effects, for example), it is necessary to establish a reference detection limit (RDL) for each laboratory. This is set as the 90th percentile value. All of the results less than the RDL are adjusted up to that value. Results that are detection limit values above the RDL are eliminated from the MRD index calculations. By definition, fewer than 10% of the detection limit values are above the RDL.

The intralaboratory MRD index for General Engineering is listed in Table 21.

Interlaboratory Comparison

Choosing a Reference Detection Limit

For interlaboratory comparisons, a new reference detection limit (RDL) must be established for calculation of the MRD. The interlaboratory RDL is chosen as the 90th percentile value from the array of detection limits from both laboratories; i.e., that detection limit value at or below which are 90 percent of the detection limit values from both laboratories.

Normalizing Data to the RDL

All of the results less than the RDL are adjusted to the new RDL value. Results that are detection limit values and are above the RDL are eliminated from the MRD index comparison and from the *t*-tests. By definition, fewer than 10% of the detection limit values are above the RDL.

For interlaboratory comparisons, the MRD is calculated as the average absolute difference between laboratories for the i^{th} well expressed as a percentage of the mean of both laboratories. For interlaboratory comparisons, x_i and y_i represent the mean analyte concentrations for the i^{th} well; x_i represents the mean from one laboratory; y_i represents the mean from the other. The means are calculated from the known sample results and the EPD blind replicate results.

In addition to the interlaboratory MRD calculations, paired *t*-tests are performed to see if the difference between the mean concentrations of an analyte from the same well reported by each laboratory is significant. The *t*-test tests the null hypothesis that there is no significant difference in the concentrations given by the two laboratories. The MRD and *t*-test results for the analytes with at least one result above the interlaboratory RDL are listed in Table 23.

Analytes with significance of probability values of less than .05 (see Table 23) have a 95% chance that one laboratory's results are significantly higher than those from the other laboratory. Total organic halogens, pH and tritium results are significantly higher for General Engineering than for IT Analytical Services. Results for potassium, total organic carbon, and total phosphates as phosphorus are significantly higher for IT Analytical Services than for General Engineering.

QUALITY CONTROL STANDARDS

During the first quarter of 1991, EPD/EMS conducted quality assessments of the two primary laboratories used for sample analysis: General Engineering (GE) and IT Analytical Services (IT). The laboratories were sent three sets of certified environmental quality control standards (Batch Numbers 2528, 2602, and 409). The following analyses are listed: common analyses in Table 29, Appendix IX analyses in Table 30, and priority pollutants analyses in Table 31. All three sets of standards were purchased from Environmental Resource Associates (ERA) of Arvada, CO.

Although the laboratories submitted two results for some analytes, only the first result obtained was recorded for each analyte. The standards analyses were reviewed by comparing the laboratory results with the ERA-certified values and advisory ranges. A comparison of their performances is shown in Figure 4.

BLANKS

To meet the guidelines of the RCRA Groundwater Monitoring Technical Enforcement Guidance Document (EPA, 1986d), three types of field quality control blanks were sent to the laboratories during first quarter. Trip blanks (BLANK) are defined as sample containers of deionized water that are transported to the well sample location, treated as well samples, and sent to the laboratory for analysis. Field blanks (FB) are generated by filling sample containers at the sample location with deionized water. They are treated as well samples and sent only to the M-Area Laboratory for analysis. Equipment blanks (EPT), new field quality control blanks initiated during third quarter 1990, are samples of deionized water that have been pumped through or have filled sampling devices and are sent to the General Engineering and IT Analytical Services laboratories for analysis. Results from these blanks are used to identify potential contaminants in the water, sample containers, or analytical equipment. The blanks tables list the dates, field measurements, and analytical results for these blanks.

The internal laboratory blank in Table 32 showed elevated results. General Engineering confirmed these results after review of the laboratory's records. The equipment blanks that accompanied the laboratory blank in its respective analytical batch are listed in the table.

General Engineering found no errors upon review of the records of the following EPD/EMS blind blanks that showed elevated results. Table 33 lists the equipment blanks that accompanied the blind blanks in their respective analytical batches.

8. FLAGGING CRITERIA

The guidelines for flagging constituents were changed by EPD/EMS beginning first quarter 1991. The new flagging criteria in Table 36 were determined by the following rules.

Flag 0: Analysis for a constituent below Flag 1 is classified as Flag 0. Constituents classified as Flag 0 in each well series will be scheduled for analyses only by custodian request or as part of the biennial comprehensive analysis program.

Flag 1: The Flag 1 criterion for a constituent equals half of the Environmental Protection Agency (EPA) primary drinking water standard, the EPA proposed primary drinking water standard, or the EPA secondary drinking water standard for that constituent. If a constituent does not have an EPA drinking water standard, the Flag 1 criterion equals 5 times the contract-specified or the observed average detection limit. If a constituent exceeds Flag 1, all wells in the monitoring series from which samples were collected will be sampled and analyzed for that constituent once a year. If a constituent falls below Flag 1 for three consecutive sampling episodes, the well's flag will be reduced from Flag 1 status to Flag 0 status and will follow the rules for Flag 0.

Flag 2: The Flag 2 criterion for a constituent equals the EPA drinking water standard, the EPA proposed primary drinking water standard, or the EPA secondary drinking water standard for that constituent. If a constituent does not have a drinking water standard, the Flag 2 criterion equals 10 times the contract-specified or the observed average detection limit. If a constituent exceeds Flag 2, all wells in the monitoring series from which samples were collected will be sampled and analyzed for that constituent twice a year. If a constituent falls below Flag 2 for three consecutive sampling episodes, the well's flag will be reduced from Flag 2 status to Flag 1 or Flag 0 status, depending on the results, and will follow the rules for the lower flag.

If a constitutent has ever been flagged in a well series, it is automatically flagged for all new wells of that series. For removal from a new well, a constituent's flag must follow the rules referred to earlier.

The following constituents are exceptions to the flagging rules but will still receive analyses by custodian request or during biennial comprehensive analyses:

- Aesthetic constituents such as odor, color, and surfactants will always be set at Flag 0 and will not trigger the scheduling mechanism.

- Some indicator constituents and major cations (specific conductance, pH, turbidity, total dissolved solids, silica, calcium, magnesium, sodium, and potassium) and common laboratory contaminants and cleaners (phthalates, methylene chloride, ketones, and toluene) will have flagging criteria but will not trigger the scheduling mechanism.

9. ANALYTICAL RESULTS

This section presents the field and analytical results for samples collected during first quarter 1991. The tables are presented in alphabetical order by well series and in numerical order within each series. The **Site Index by Well Series** following this section contains the area name(s) for each series. The tabular data contain all the analytical results for samples collected during this quarter except for those analyses described in the **Analytical Data Review** and **Quality Control Samples** sections. Some samples are analyzed for field data only and have no laboratory analyses.

The following codes may appear in the tabular data.

B = analyte detected in associated blank as well as in sample
