16. ABSTRACT

This Document is the Final Report of the Solar Energy Heating and Hot Water System installed at the Kansas City Fire Station, Number 24, 2309 Hardesty Street, Kansas City, Missouri. The solar system was designed to provide 47 percent of the space heating, 8,800 square feet area and 75 percent of the domestic hot water (DHW) load. The solar system consists of 2,808 square feet of Solaron, model 2001, air, flat plate collector subsystem, a concrete box storage subsystem which contains 1,428 cubic feet of ½ inch diameter pebbles weighing 71½ tons, a DHW preheat tank, blowers, pumps, heat exchangers, air ducting, controls and associated plumbing. Two 120-gallon electric DHW heaters supply domestic hot water which is preheated by the solar system. Auxiliary space heating is provided by three electric heat pumps with electric resistance heaters and four 30-kilowatt electric unit heaters. There are six modes of system operation.

This project is part of the Department of Energy PON-1 Solar Demonstration Program with DOE cost sharing $154,282 of the $174,372 solar system cost. The Final Design Review was held March 1977, the system became operational March 1979 and acceptance test was completed in September 1979.

I. INTRODUCTION

Fire Station 24 is a 3 bay fire station located in the central portion of Kansas City, Missouri; however, the original design for this project was for a different site and for a 2 bay station. For this semi-rural site the City retained Midgley Shaughnessy Fickel and Scott Architects to provide architectural services.

Towards the end of completing the contract documents for this station, the Gas Company notified the City that it would cost them approximately $35,000 to have a gas line installed to service the site. The City began looking at alternate energy sources and through the initiation and encouragement of Cleve Humbert, Assistant City Architect in charge of Maintenance, solar energy became a viable option to be investigated.

The most important criteria that the architects looked for in a solar system was simplicity and reliability. It was determined that an air system met the requirement better than a liquid system and that the Solaron Corporations experience and quality product gave them an edge over other companies. In November of 1975 a response was submitted to PON 1 requesting funding for a solar heating system. In April of 1976 the City was notitied the proposal was one of 34 proposals selected. Preliminary design was started in October 1976 and construction documents completed in March 1977. In June 1977 City requested approval from DOE to relocate the fire station to 22nd and Hardesty. The revised drawings were completed and released for bids in September 1977. In December the City awarded a contract for construction and construction started in February 1978. The building was occupied by the City in April of 1979.

II. SUMMARY OF PROJECT INFORMATION

A. General Information

Owner: City of Kansas City, Missouri

Contractor: D.F. Cahill Construction Co.
4721 Denver Avenue
Kansas City, Missouri 64130

Operational Date: August, 1979

Building:

Type: Fire Station

Area: 8,800 sq. ft.

Location: 22nd & Hardesty, Kansas City, Missouri

B. Meteorological Data

Latitude: 29° N

Climate Data:	Winter	Summer
Avg. temp. (°F)	41.0	71.7
Avg. insolation (ly/d)	298	545
Degree days (heating):	4711	

C. Solar Energy System

Application: Heating, 47%; hot water, 75%

Collector:

Type: Air cooled, flat plate

Area: 2808 sq. ft.

Manufacturer: Solaron Corporation
Denver, Colorado 80222

Storage:

Type: 1/2-inch diameter rock

Capacity: 1,428 cu. ft.

Auxilliary/Back-up System:

Heat pumps and resistance heating (operations area)

Resistance heaters (apparatus bay)

Electric heater (water)

III. DESCRIPTION OF THE SOLAR HEATED FIRE STATION

The fire station consists of two basic areas. The operations area (which is also air conditioned) occupied by the firemen, and the apparatus bay occupied by the fire equipment. The operations area contains 2,800 sq. feet and the apparatus bay 6,000 sq. feet. A winter design temperature of 50^{0} was established for the apparatus bay and 70^{0} for the operations.

The solar energy system is based on a prototype model which has been in continuous successful operation since 1957. There are three arrays of collectors, two mounted on the roof and one large array attached to the building. There are a total of 144 factory assembled modules 36 in. by 78 in. Each module has double tempered glass covers and a sheet absorber, with an air duct below the permanent black absorber surface.

The solar collectors were designed as an intergral part of the apparatus bay. East and west screen walls were used to eliminate the awkward profile created by the three rows of roof mounted collectors. The fire station architect has been awarded a certificate of design excellence by the Midwest Concrete Industry Association for his conceptual development.

The extent of collector shading caused by the screen walls was measured at Kansas State University with equipment capable of providing sunpath and solar angle information relative to radiant energy and shading calculations. From these measurements, it was established that throughout the entire heating season between the hours of 10:00 a.m. and 3:00 p.m., the maximum shading was 1.5 per cent and between the hours of 9:00 a.m. and 4:00 p.m., the maximum shading was 7.6 per cent.

The solar heating hardware installation was met with few difficulties. Adapting the collectors and related equipment to the building structure

was carefully engineered during the development of construction plans. Other than a few sealant failures that allowed storm water to enter the building through the roof collectors, the installation has proved satisfactory. Vandalism has occurred in that collector glass has been broken. Replacement was readily effected as the glass panels are of standard manufacture.

Due to the hybrid temperature control installation, the facility users have experienced occasional difficulty in setting room thermostats which control three sources of heat i.e., solar heat, heat pump operation and direct resistance electrical duct heaters. Future solar heating installations should provide for single unit temperature control without regard to setting of multiple thermostats in each room or zone.

Floor plans and building details can be found in Appendix A.

IV. DESCRIPTION OF THE SOLAR HEATING SYSTEM

A. Solar Collector

1. There are 3 separate arrays of collectors. Two of these arrays are mounted on the roof and consist of 24 collectors each. One large array extends from the roof to the ground forming the south wall of the apparatus bay. This array consists of 96 collectors.
2. Total No. of Collectors: 144

   Total Sq. Ft. of Collectors: 2,808 sq. ft.

B. Storage System

1. Space Heating Storage consists of an insulated reinforced concrete box 35'-4" long x 8'-7" wide x 8'-3-1/2" high containing 71.5 tons of 1/2" diameter crushed limestone.
2. Hot water storage consists of 1 - 120 gallon glass lined steel tank.

C. Air Handling Systems

1. A.H.U. #1 (5600 CFM): moves air through collectors and storage.
2. A.H.U. #2 (4200 CFM): moves air AHU #1 to operations area.
3. A.H.U. #3 moves air from AHU #1 to the apparatus bay.

D. Solar Hot Water Heating

1. An air-water heat exchanger built into the ductwork preheats water for two 120 gallon electric water heaters. Water is stored in one 120 gallon tank.

E. Automatic Control System

1. Thermostats and other temperature sensing devices automatically regulate the water pump, air handling units, and the motorized dampers used to operate the system.

F. Auxiliary Heating Systems

1. The operations area has three split system heat pumps with auxiliary electric resistance heaters.

2. The apparatus bay has four 30 KW electric unit heaters.

G. Data Acquisition System

Fifty-Five sensors located throughout the installation provide data on parameters such as air flow, air temperature, water temperature and sunlight striking the collector. These data are automatically stored on tape and sent daily to a data processing center for reduction, evaluation, printing and distribution. This monitoring subsystem will provide answers to such key questions as system efficiency and reliability, operating costs and approximate fuel savings.

H. Modes of Operation

The system has six modes of operation.

1. Heating the building with hot air from the collector.

2. Storing heat by drawing heat from the collector through the rock box.

3. Heating the building with heat stored in the rock box.

4. Heating water by drawing air from the collector past heat exchange coils and back to the collector. In this mode the building and the rock box are bypassed. Water heating also occurs during modes (1),(2) and (3).

5. Heating with the heat pumps. When the heating requirements of the building are more than can be supplied by the solar heating system, the auxiliary heat pumps automatically come on and provide the needed heat.

6. Heating with electric resistance. When the heat pumps can no longer provide the heating required, the auxiliary resistance heaters come on.

A schematic of the heating system and the six (6) modes of operation are shown in figures 1 - 6. Dashed lines indicate air flow.

Further details of the solar heating system, including as-built drawing and diagrams, a description of hardware, a detailed sequence of operations, and maintenance instructions are found in Appendixes B - E.

V. HISTORICAL NARRATIVE OF THE PROJECT

In June of 1976 a contract was awarded to the City by ERDA. The following is a summary of the sequence of events:

A. Design

1. Preliminary Design of the fire station and solar system started in September and was finished in October.

2. Preliminary Design Review was held on October 20, 1976. As a result of the preliminary design review the City decided to investigate adding the capability of providing domestic hot water heating utilizing the solar system.

e. Construction documents were started in September 1976 and completed in March 1977.

4. Final Design Review was held on March 8, 1977.

5. The City did not release the drawings for bidding due to a re-evaluation of their priorities within the Fire Department.

6. In June 1977 the City asked ERDA for permission to relocate the fire station to another site with the stipulation that the solar system would remain basically unchanged. ERDA granted this request and new construction drawings were started.

7. The revised construction documents were completed and released for bidding the 1st of September.

8. The City awarded a contract for construction in January 1978/

9. Construction was delayed two months due to weather conditions. By the 1st week in May the footings and foundation walls were poured.

10. Collectors arrived in May and were stored in a warehouse.

11. Structural steel was set in place during July and August.

12. The storage box was completed with the exception of the insulated wood lid in October.

13. Collectors were installed during November.

14. During January and February 1979 completion of the solar system was delayed due to the discovery that the rocks as installed did not meet the sizes as specified.

    Approximately 75% of the rock that was installed was 3/8" to 1/2" in diameter in lieu of 3/4" which was specified. After recalculating the static pressure and the contractor agreeing to install larger motors on the fans authorization was given to complete the solar system.

15. In May 1979 the building was completed. However, through the summer months final adjustments were made to the solar system with the acceptance test taking place in July.

VI. DESCRIPTION OF THE DATA ACQUISITION SYSTEM

In order to obtain information necessary for evaluation of the performance and operation of the solar heating system throughout the year, 55 sensors were installed within the system. These sensors were furnished by the government and installed at government expense in accordance with the document, "SHC-1006, August 3, 1976; Instrumentation Installation Guidelines for the National Solar Heating and Cooling Demonstration Program." In Table 2, each sensor is listed by a code designation and by the parameter measured. The number sequence in the code indicates the data groups in accordance with the following table:

Number Sequence	Data Group
001 to 099	climatological
100 to 199	collector
200 to 299	thermal storage
300 to 399	domestic hot water
400 to 299	space heating
500 to 599	space cooling
600 to 699	building/load

Each sensor provides data to a Site Data Acquisition Subsystem (SDAS) every 5 minutes around the clock. The SDAS digitizes the data and stores it on tape. Once a day the data is sent by telephone to a Central Data Processing Facility where it is reduced. Monthly reports are prepared, one of which is sent to the City of Kansas City, Missouri.

The monitoring system will permit the government to determine the following kinds of information:

* Savings in conventional energy resulting from the use of solar energy for heating and/or cooling.
* Portion of the total heating and/or cooling load supplied by the solar energy.
* Efficiency of the system in converting solar radiation into useful thermal energy.

* Thermal performance and reliability of major subsystems or components over the demonstration period.

Table 2 describes each sensor in terms of its general location and the parameter that is being measured. The specific location of each sensor can be found in the as-built drawing of the system found in Section IV Figure 1 Schematic Drawing of Solar Heating System.

VII. COSTS OF THE FIRE STATION #24 SOLAR HEATING SYSTEM

Given in Table 3 are the estimated and the actual costs of the various phases of the project.

Overall, the construction costs were $130,369. This figure is $18,710 or about 16.76% more than the original estimates. Most of the additional cost was for general construction cost, and can be attributed to the lack of detailed drawings and lack of experience to draw on in forming the original estimate.

Costs were shared by the federal government and the city government. The Department of Energy provided 88.48% of the total costs associated with the solar heating system. Thus, of the total amount of $174,372, the Department of Energy paid $154,282 and the City of Kansas City, Missouri, $20,090. The difference in the two sets of cost data (construction and total) is made up of architects fees, instrumentation cost, travel cost and miscellaneous city personnel costs.

The contract was modified twice to cover cost increases. In May 1978, the dollar amount was increased by $18,710 (government share, 60.24%) to cover additional costs associated with the construction of the solar heating system. In July 1978, the contract was increased by $13,526 (government share, 100%) to cover costs associated with the Site Data Acquisition Subsystem. The City is grateful to the Department of Energy for its willingness to bear these additional costs.

APPENDIX C

APPENDIX D

SEQUENCE OF OPERATIONS OF THE SOLAR HEATING SYSTEM

HEAT PUMP
ENERGIZE F/HEATING OR COOLING

SOLARON CONTROL PANEL HC0116
WITH HC0022 OR HC0023 THERMOSTAT AND HC004 SUB-BASE

SEQUENCE OF OPERATION

I. SOLAR ENERGY AVAILABLE - when 40°F (±7°F) differential is achieved between sensors Tco (in collector) and Tci (in return air duct - see specific plans), the following events take place:

A. Storing Heat - Room thermostat not calling for heat.

1. Differential thermostat in Solaron controller will activate "COLL" (collector) relay.

a. MD1 (motorized damper) - will be energized and powered open to allow air to flow to the inlet of the solar air handler blower (BWR), which is energized at the same time.

b. HWP (hot water pump) is also energized at this time if the Tw sensor (aquastat on water storage tank) is not satisfied (i.e. tank is less than 140°F).

c. MD2 (motorized damper) will be energized and powered closed to prevent air from flowing to the auxiliary heating unit.

B. First Stage Heating is called for by room thermostat - W_1 & R_H and sub-base system switch is set on "Auto" or "Heat".

1. "H1" (first stage solar heating) relay is energized.

a. "G" and "R" (fan auxiliary furnace) are energized, bringing on the heat pump indoor fan.

b. MD3 circuit is energized, closing the damper from its fully open position to its partially open or fully closed position (field balancing required).

c. MD2 opens as power through N.C. contacts in relay "HI" are interrupted.

d. Relay contacts close circuit to Ts sensor which is still in an open circuit via the "COLL" relay contacts position.

*C. Second Stage Heating is called for by room T-stat. First stage is still "made". If solar heat is available (i.e. "COLL" relay energized) when "H2" relay is energized, solar system will store heat while heat pump provides space heat.

1. "H2" (second stage auxiliary heat) relay is energized, completing the following circuits:

a. MD2 is powered closed.

b. MD3 is unpowered - opens full.

c. "R_C" circuit is completed to "Y" bringing on compressor in heat pump.

d. "R_C" circuit to "G" is still made keeping on auxiliary indoor unit blower.

e. "R_C" circuit to "R3" is completed. No additional auxiliary relays are energized at this time.

D. Third Stage Heating is called for by second room T-stat (or outdoor thermostat). "R3" circuit to "W3" is completed, bringing on resistance electric heating elements in the indoor auxiliary unit ("R" to "W_1" circuit and "R" to W_2 circuit in HC0116 are "made").

E. "Emergency Heat" (to be used only if directed to do so by your service repairman, in the unlikely event of a heat pump malfunction). When the sub-base switch is put in this position the "Emergency Heat" relay will be energized.

The "EA" relay will complete the circuit between "R" and "E" allowing the indoor auxiliary unit to bring on the electric resistance heat when there is a call for heat from the heat pump (H2 energized).

II. SOLAR ENERGY NOT AVAILABLE. When differential between Tco and Tci drops to 25°F (±5°F) or less, the following takes place:

A. "COLL" relay - de-energized.

1. HWP de-energized, pump off.

2. BWR de-energized, solar blower off.

3. MD1 de-energized and closed.

4. MD2 de-energized and open.

B. Circuit completed to Ts sensor if "H1" relay is still energized. If Ts sensor is above 90°F set point, system will heat space from heat storage unit. If Ts sensor is below 90°F set point circuit will be completed to "H2" relay and bring on the auxiliary heating unit without the need for the second stage of the T-stat to make.

III. Sub-base Switch Modes.

A. Fan - "On-Auto".

1. "Auto" position will permit auxiliary indoor unit fan to cycle on and off to meet the heating demands of the system.

2. "On" position will allow the auxiliary indoor unit fan to run constantly and allow MD3 (by-pass) damper to open fully, except when first stage heating is required.

B. Thermostat calling for Cooling (Summer Operation) System switch on "Auto" or "Cool".

**1. First stage cooling:

a. "R_C" circuit to "Y_1" is "made", on heating/cooling thermostat energizing reversing valve in outdoor unit (for units with reversing valve energized for cooling).

b. "R_C" to "G" made; "R" to "G" made in HC0116 panel, brings on heat pump indoor unit fan.

2. Second stage cooling.

"R" to "Y" contacts close. Compressor circuit is energized to provide cooling.

NOTES

* Heat Pump Systems with reversing valve energized for heating can generally be wired as follows:

HC0116 Terminal Strip	Heat Pump Terminal Strip Equivalent
Y	W_1
W	W_2
O	Y

**Heat pumps where the reversing valve is not energized for cooling use only one stage of cooling.

DOMESTIC WATER HEATING

Switch "Winter" Position

Domestic water will be preheated anytime the system is storing heat or heating from collector.

Switch "Summer" Position

Domestic water will be preheated whenever enough solar energy is available to activate the system. When the stored water temperature reaches the set point of Tw sensor (about 140°F) the system will shut-down until the stored water temperature drops about 10°F.

APPENDIX E

MAINTENANCE INSTRUCTIONS

FOR THE

SOLAR HEATING SYSTEM

MAINTENANCE INSTRUCTIONS

The following items should be performed semi-annually:

1. Inspect V-belt and sheaves for wear, check belt tension.
2. Inspect damper linkage.
3. Clean or replace filters (more frequent if required)
4. Oil pump motor with #20 non-detergent oil - do not over lubricate.
5. Oil AHU blower motor with #20 non-detergent oil - do not over lubricate.
6. All thermostats in the operations area must be placed in either the "heat" or "cool" position appropriate for the season. (If the thermostats are placed in the "auto" position, an undesirable condition can occur in which the solar system is attempting to heat while the A/C is trying to cool if the temperature levers are "jammed together").
7. Slide gate (D-1) is removed for summer operation. The gate is replaced for heating season operation.
8. Switch (summer/winter) on the solaron control box must be placed in the appropriate position for the desired operation of the system.
9. "Walk through" - A total system examination should be conducted at the beginning and at the end of each heating season to determine condition of the following:
    1. Damage to collector glazing
    2. Water in the collectors due to precipitation leaks
    3. Physical damage to thermal insulation of duct work
    4. Cleanliness of collector glazing - Clean if necessary, with mild soap and water solutions using soft window brush and rinse well
    5. DHW leaks under the storage tank, hot water heaters and the heat exchanger.

APPENDIX G

ACCEPTANCE TEST

OF THE

SOLAR HEATING SYSTEM

FIRE STATION 24 ACCEPTANCE TEST PLAN

A visual inspection shall be made to assure ducting functionally conforms to the plans. Manual dampers D-1 and motor driven dampers D-2 and D-3 should be closed. Space thermostat heat anticipators shall be set with first stage at 0.10 amp and second stage at 0.10 amp. Set thermostat so there is no call for heat. "Summer-Winter" switch on control panel shall be placed in the "Winter" position. System power shall be turned on. If solar energy is sufficient to activate the ΔT controller the AHU fan and water pump will start and run in the storing heat mode. (If solar energy is not available disconnect Tco lead to simulate). Static pressure and temperature shall be measured in the collector inlet and outlet udcts and at the heat storage inlet and outlet ducts. The collector ΔP will be used to estimate the flow and the fan speed will be adjusted accordingly if required. Fan motor amperage shall be measured.

The space thermostat shall be set to make the first stage of heating. This will reposition the dampers shifting the solar heated air into the building space. Static pressures, temperatures and amperage shall be measured in this mode.

Jumpering Tco terminals (or opening Tci) will simulate no solar energy available at the collector. The system will then go into the heat from storage mode. Static pressures, temperatures and amperage will be recorded. Adjusting the set point of Ts upward to the air temperature out ot storage will simulate the storage temperature dropping to the normal set point of 90^{o} F. When Ts switches the solar AHU will stop and the unit heaters will start and maintain the set point of the first stage of the thermostat. Ts shall then be reset down to place sytem back in the heating from storage mode. Increasing the set point of the space thermostat to make the second stage of heating simulates a further drop in space temperature indicating the heat taken from storage is insufficient to offset the building heat loss. This will shut down the solar AHU and start the unit heaters.

THIS PAGE

WAS INTENTIONALLY

LEFT BLANK

Jumper shall be removed from Tco.

"Summer" operation for preheating water shall be tested by removing manual damper D-1 to by-pass the heat storage unit and placing the "Summer-Winter" switch in the "Summer" position. Static pressures, air temperatures and amperage shall be recorded. The aquastat, Tw, shall be reset down so that the set point is below the water temperature (if water temperature is below the minimum set point a lead can be disconnected). This will simulate the water temperature rising to the set point and will stop the pump and AHU fan.

RE: K.C. Fire Station No. 24

Gentlemen:

We have reviewed the air balance report submitted for this project and it appears fan numbers 2 and 3 need rpm adjustment to comply with design criteria. Fan no. 2, which serves distribution to operations area units, should be speeded up such that circulated air is plus or minus 5% of 4300 cfm design in lieu of 3560 cfm which is only 82% of design. Motor amp readings included in report indicate this should be possible without changing motor, however motor sheeves may have to be replaced. Fan no. 3, which serves apparatus bay only could be left as is without detrimentally affecting this or other systems operation, however air quantity being supplied, 7575 cfm is approximately 150% of design.

Fan no. 1 serving the solar loop is circulating 7% more air than as designed or the diffence between 5000 and 5360 cfm, but this should be satisfactory.

The indoor units nos. 1, 2, and 3 are all delivering more air than design, from 13 to 19% which should not pose any particular problem. There is quite a disparity between the four outlets served by unit no. 3, but all these outlets are in the same room. If these outlets are unusually disturbing to the occupants with regard to noise they should be adjusted but otherwise can remain as is and should function satisfactorily concerning heating or cooling.

Please contact us if you have any questions.

Sincerely,

David A. Davidson

APPENDIX H

SYSTEM INSTALLATION

AND

CHECKOUT PROBLEMS

SYSTEM INSTALLATION AND CHECKOUT PROBLEMS

A continuing problem with the instrumentation installation was rainwater seepage into the area where the SDAS was located. The water on the floor made it difficult and dangerous to check out the instrumentation wiring. After various methods had been tried to overcome the seepage problem, it was finally solved primarily by elevating and recontouring the soil outside the wall and installing drain tile at the base of the wall. This was achieved just prior to completion of the Acceptance Testing.

Changes in the instrumentation contractor's personnel after the initiation of this work at the fire station contributed to a major problem of wiring errors between the junction box, transformers, and the SDAS. As with all relatively new developments such as solar energy, much of the technology is conveyed verbally. Consequently, when there is a personnel change, some loss of system understanding is to be expected. The wiring problems were resolved with the assistance of an instrumentation engineer from the Marshall Space Flight Center.

During the acceptance testing, it was noted that one of the collectors had a broken inner glass. The glass was subsequently supplied by the collector system vendor and installed by the city.

The system evaluation test determined that one motor-driven damper was the wrong type. Item should have been spring loaded to shut after power was removed but it was electrically driven in both directions. Device was replaced by proper configuration after the acceptance test.

During the system operational airflow measurements, it was discovered that AH#2 was flowing about 82 percent of the design requirement. The adjustable pulley was changed to give the required system design speed. Additionally, the airflow rate of AH#3 exceeded the design requirements; however, because of the smaller than recommended pebble size in the rock box, it was decided to leave the flow rate at the higher level.

Considerable difficulty has been experienced with fire personnel changing the thermostat settings which causes the control system to bypass the solar heat and go into the heat pump or the electrical heat strip mode. This, of course, plays havoc with system efficiency as determined by the data system. Some thought has been given to placing "locks" on the thermostat to prevent changes to the selected temperature levels. A more expensive change would be to replace the thermostats with the type that would use available solar heat before the auxiliary heat system would be energized.

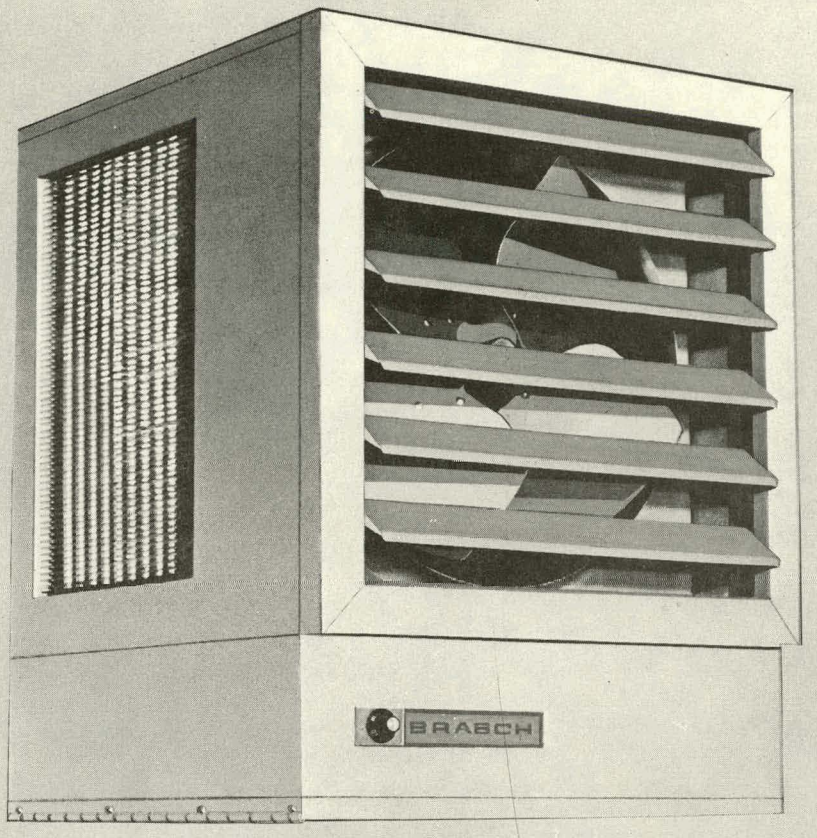
Some minor insulation discrepancies were noted during the "walk through". The water pipes near the hot water heat exchanger and near the water heaters had not been insulated. This was accomplished at a later date. The "walk through" showed that the overall mechanical work was excellent including duct work placement and insulation workmanship. The solar system was deemed operational and functionally acceptable in September 1979.

APPENDIX I

PRODUCT LITERATURE

FOR COMPONENTS OF

THE SOLAR HEATING SYSTEM



BRASCH

Electric Unit Heaters

72

applications

For complete or supplementary heating of entryways, storerooms, kitchens, garages, shipping rooms, warehouses, factories, hangers, power generating plants, pump houses and stores.

Eliminates piping, valves, traps, freezeups, water leaks, vagrant heat waste, vents, stacks, gas piping and pilot lights.

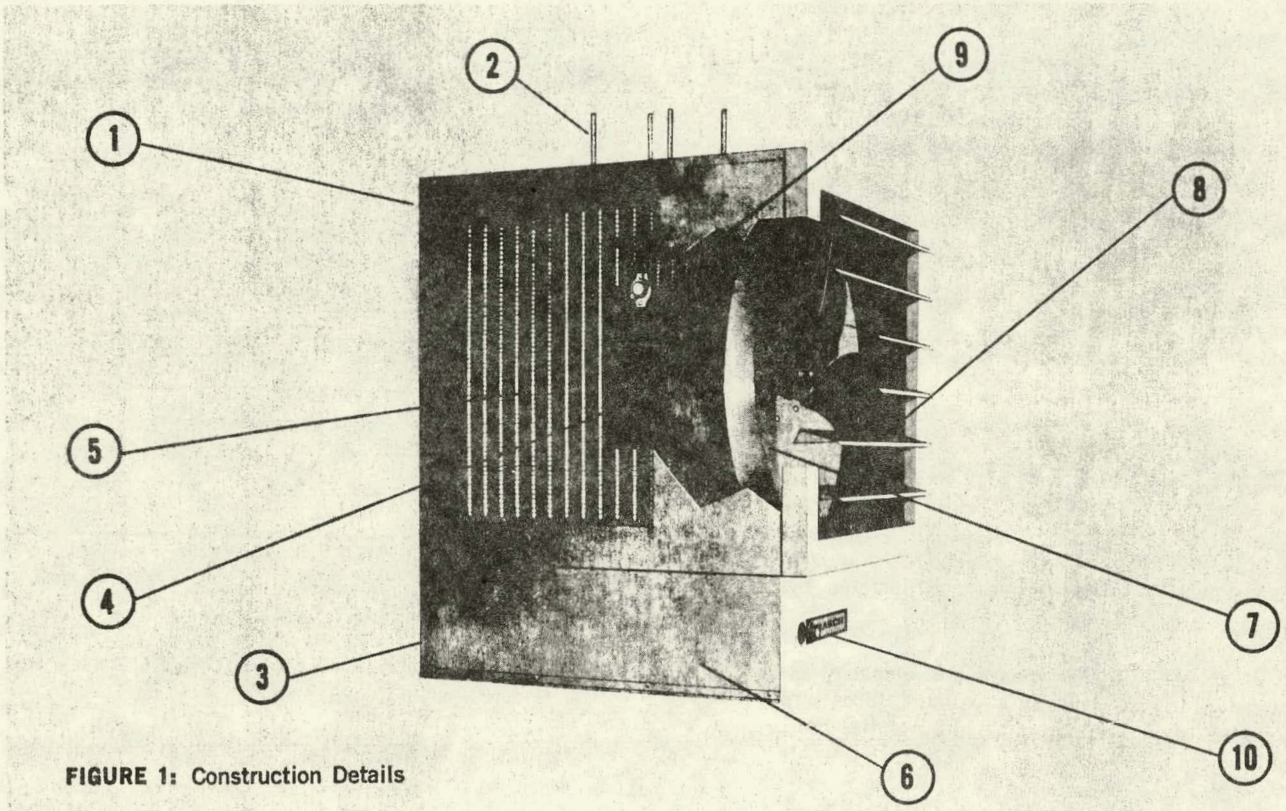


FIGURE 1: Construction Details

construction details

1. **HEAVY DUTY CONSTRUCTION**—cabinets are made of heavy gauge welded domestic steel for durability and trouble-free operation.

2. **MOUNTING**—recessed welded fasteners on top and back of housing for threaded rod-type hangers are standard. Optional swivel-type combination wall or ceiling mounting brackets allow up to 180° adjustment of discharge air direction. *All models are suitable for either horizontal or vertical airflow.*

3. **SUPPLY CONNECTION**—single connection eliminates separate fan motor circuit.

4. **MOTOR**—fan motors have built-in automatic reset thermal overload protection. Heaters with motors 1/4 hp or greater have permanently lubricated ball bearings. Motor is ventilated with unheated air.

5. **PLATE FIN ELEMENTS**—rugged, copper plated steel tubular elements are brazed to multiple fins for extra strength and maximum heat dissipation. Fins are protected against corrosion by high temperature paint. Automatic reset thermal cutout protects heater elements from overheating.

6. **SERVICE COMPARTMENT**—hinged service door allows easy access to line terminals, contactors, fuses and transformers.

7. **FAN**—dynamically balanced aluminum fan. Draw-through design assures even air distribution over elements and uniform outlet temperatures.

8. **LOUVERS**—each louver is adjustable for positive control of discharge air.

9. **HOUSING**—contemporary styling, heavy gauge steel. Tough, durable neutral grey, baked enamel finish resists corrosion and assures long life, even in fume laden industrial atmospheres.

10. **THERMOSTAT**—optional built-in thermostat for 1 or 2 stage control with knob adjustment.

energy savers

THERMOSTATIC FAN SWITCH — built into each 5 KW and larger unit, dissipates residual heat to recirculate ambient air until temperature drops to 90F.

TWO STEP CONTROL — provides smaller KW steps for finer control and less operating cost (standard on many models).

NIGHT SETBACK THERMOSTAT — conserves energy with separate temperature settings for daytime comfort and nighttime economy (remote horizontal mounting).

built-in controls

MAGNETIC CONTROL CONTACTOR – disconnecting break contactors provided as standard unless heater is single phase and operated by load-carrying thermostat.

SUBCIRCUIT FUSING–when heater ampacity exceeds 48 amps, built-in subcircuit fuses are supplied to meet Paragraph 424-22 of the 1975 NEC.

FAN DELAY – dissipates all residual heat from elements and recirculates entering ambient air until temperature drops to 90F for maximum energy conservation. Provided in 5 KW units and larger.

MOTOR OVERCURRENT PROTECTION – motor fusing is built-in for unit heaters over 40 amperes when the motor is greater than 1/8 HP. All units incorporating a stepdown transformer to drive the fan motor have built-in transformer primary fusing.

CONTROL THERMOSTAT – optional built-in or wall mounted thermostat kits to achieve best area comfort level. Built-in thermostat eliminates control wiring and is adjustable from the front of the heater. (see page 8).

CONTROL TRANSFORMER— Optional 24V control transformer available on all units (see Fig. 4).

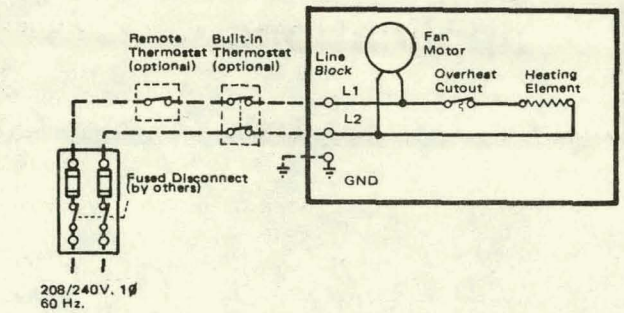

FIGURE 2: 240V, Single Phase, 2.5 KW Circuit Diagram

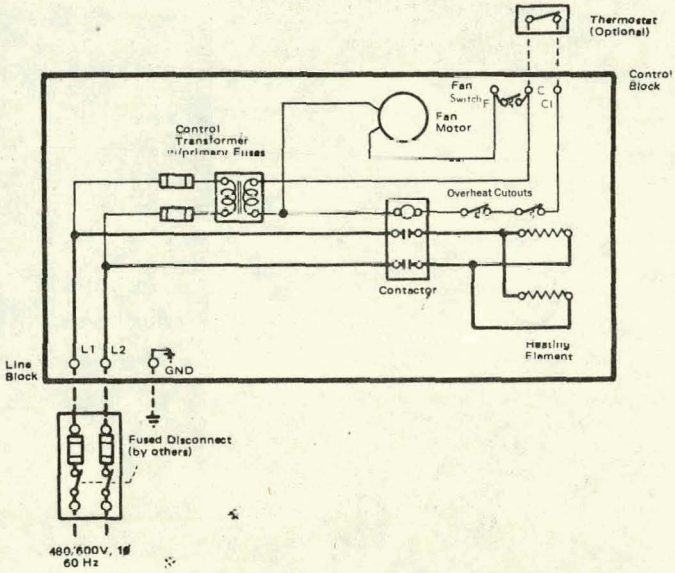

FIGURE 3: 480V, Single Phase, 10 KW Circuit Diagram

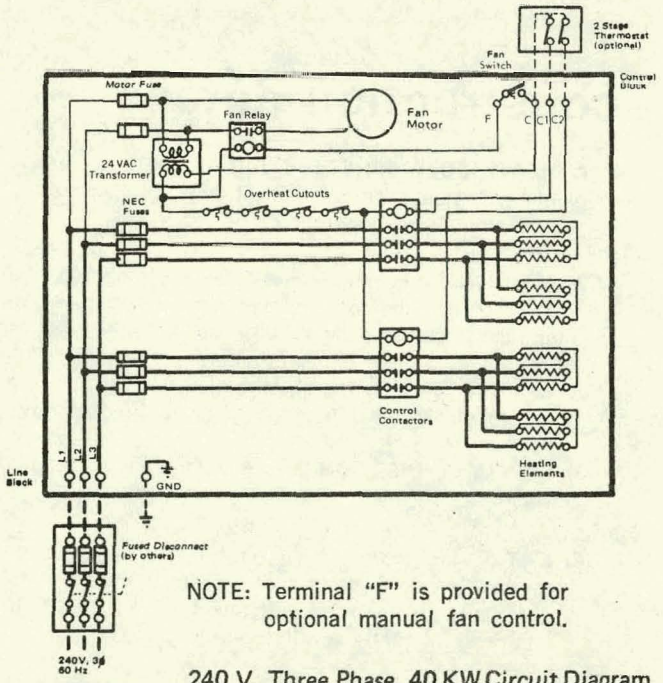

NOTE: Terminal "F" is provided for optional manual fan control.

FIGURE 4: 240 V, Three Phase, 40 KW Circuit Diagram with optional 24 V control.

TABLE 4: TEMPERATURE CONTROL KITS

CATALOG NUMBER	DESCRIPTION
TK-1	Integral Thermostat Kit, 1 Stage Heating (SPST, 24-277V) shipped separately as kit
TK-1FM	Same as TK-1, except factory mounted
TK-2	Integral Thermostat Kit, 1 Stage Heating, (DPST, 24-277V) use where full line break is required, shipped separately as kit
TK-2FM	Same as TK-2, except Factory Mounted
TK-3	Integral Thermostat Kit, 2 Stage Heating (S-SPST, 24-277V) shipped separately as kit
TK-3FM	Same as TK-3, except Factory Mounted
TK-4	Wall Thermostat Kit, 1 Stage Heating (SPST, 24-277V)
TK-5	Wall Thermostat Kit, 1 Stage Heating (DPST, 24-277V) use where local codes require a full line break
TK-6	TK-6 Wall Thermostat Kit, 2 Stage Heating, Auto/On and Heat/off/Cool Switches on subbase (2-SPST, 24V only)
TK-8	Wall Thermostat Kit, 1 Stage Heating, 1 Cooling (2-SPST, 24-240V)
TK-9	Subbase for TK-8, Fan/Off/Auto Switch
TK-10	Wall Thermostat, 2 Stages Heating (2-SPST, 24-240V)
TK-11	Summer/Winter Switch Kit, (SPST, 24-277V) shipped separately as kit
TK-11FM	Same as TK-11, except Factory Mounted
TK-12	Wall Thermostat Kit, Night Setback with 24 Hour Timer, 1 Stage Heating (SPST, 24V only), does not require separate power supply
Suffix-24	24V Control With Contactor if Required (add suffix to unit catalog number)
Suffix-2S	Two Step Operation in lieu of single step (add suffix to unit catalog number)
Suffix-MR	Manual Reset Thermal cutout (add suffix to unit catalog number)
Suffix-RC	Remote Control Panel, UL Listed, surface mounted (consult factory) (add suffix to unit catalog number)

TABLE 5: DIFFUSER KITS

CATALOG NUMBER	DESCRIPTION
CD-1	Diffuser Kit, Cone type for vertical discharge (2.5-20 KW)
CD-2	Diffuser Kit, Cone type for vertical discharge (25-50 KW)
LD-1	Diffuser Kit, Four-Way Louvers (2.5-20 KW)
LD-2	Diffuser Kit, Four-Way Louvers (25-50 KW)

CATALOG NUMBER	DESCRIPTION
WB-1	Wall Mount Assembly Kit (for horizontal discharge) wall and swivel brackets
SB-1	Swivel Bracket Kit (for ceiling mounting, horizontal discharge)
TR-1	Rod Hanger Kit, Four, ½-13 x 24 (for horizontal or vertical discharge)

TABLE 3: AIR DISTRIBUTION PATTERNS (VERTICAL DISCHARGE)

APPROXIMATE MOUNTING HEIGHT AND FLOOR COVERAGE (FEET)

SIZE (KW) BTU-	STANDARD LOUVERS (0°)	STANDARD LOUVERS (45°)	4-WAY LOUVERS (45°)	CONE DIFFUSER
2.5- 5	12 / 30 × 21	10 / 20 × 34	10 / 34	9.5 / 34
7.5-10	15 / 46 × 29	13.5 / 29 × 48	13.5 / 48	13 / 48
12.5-20	19 / 59 × 52	15.5 / 37 × 62	15.5 / 62	14 / 62
25-50	23 / 74 × 70	19 / 47 × 78	19 / 78	18 / 78

Note: Height is based upon optimum floor coverage with 50 fpm velocity four feet above the floor. Specific boundary pattern is dependent upon obstacles, drafts and mounting arrangements. Drawings are not to scale.

sample specification

1. Furnish and install Brasch UL Listed unit heaters with voltage, phase, number of steps, heating and air delivery capacities as scheduled. Threaded mounting holes shall be provided and each unit shall be universally suitable for vertical or horizontal mounting.
2. Unit heater shall be draw-thru design to provide uniform temperature across heater element and forced air cooling of motor with ambient air.
3. Heater elements shall be corrosion protected, plate fin type with elements brazed to common fins for maximum strength and heat transfer. Contactor(s) shall provide disconnecting line break. Automatic reset thermal cutout for each element assembly shall provide protection from overtemperature.
4. All motors shall have permanently lubricated bearings, built-in thermal protection and shall be completely enclosed. Motors ¼ HP and greater shall have ball bearings. Separate motor supply circuits shall not be required.
5. All units to have single supply circuit with fuses as required by NEC for element and motor protection.
6. Fans shall be aluminum, directly connected to the fan motor. Units 5 KW and larger shall have thermal fan delay to remove residual heat from heater cabinet and recirculate ambient air until temperature drops to 90F for maximum energy savings. All metal surfaces of the cabinet shall be protected by baked epoxy finish.
7. Brackets shall be furnished for wall (or ceiling) mounting where shown on heating schedule.
8. Individually adjustable louvers shall be furnished to direct discharge air as desired. (Optional: Downflow diffusers shall be provided where shown on schedule. Specify: Cone type, or four-way adjustable louver.
9. Thermostat shall be provided where shown on schedule, to match number of heater control steps. (Specify: Built-in or remote room thermostat.)
10. Other options provided shall include:
    A. 24V Transformer
    B. Two Step Control
    C. Summer/Winter Switch for Ventilation Only
    D. Main Disconnect Switch (Remote)
    E. Heating/Cooling Thermostat with Fan Switch Subbase
11. Manufacturer shall provide one year guarantee against defects in workmanship or material.

mounting arrangements

Any Brasch unit heater can be mounted in either a horizontal or vertical discharge position:

HORIZONTAL DISCHARGE—heaters can be mounted horizontally using four 1/2-13NC threaded rods (provided by others) or the optional swivel and wall mounting brackets. The swivel bracket allows heater to be rotated to face various directions and can be ordered separately for use as a ceiling bracket. The wall mounting bracket provides minimum spacing required for the heater in all directions. A 1-8NC threaded bolt with locknut attaches the swivel bracket to the wall bracket. The wall mounting bracket attaches to the wall using four SAE Grade 5, 1/2-13NC bolts and nuts. Bolts and nuts are provided as part of the wall mount and swivel bracket kits.

TABLE 7: MOUNTING DIMENSIONS

HEATER KW	H	J	K	L	M	W	W¹	V
2.5—20	26¼	26	7	9	5	17	—	15
25—50	35¼	31	7	9	5	—	22½	16

VERTICAL DISCHARGE—heaters are mounted vertically using four 1/2-13NC threaded steel rods (provided by others). Four threaded holes on top of the heater are provided with internal stops to prevent excessive insertion of rods. Additional mounting hardware, if required, is supplied by the installer.

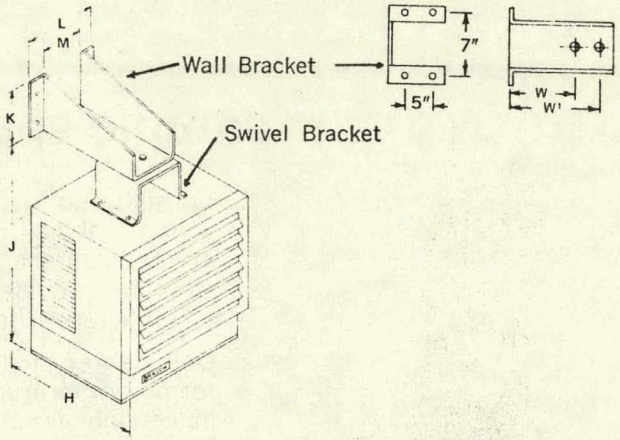

FIGURE 8: Horizontal Discharge

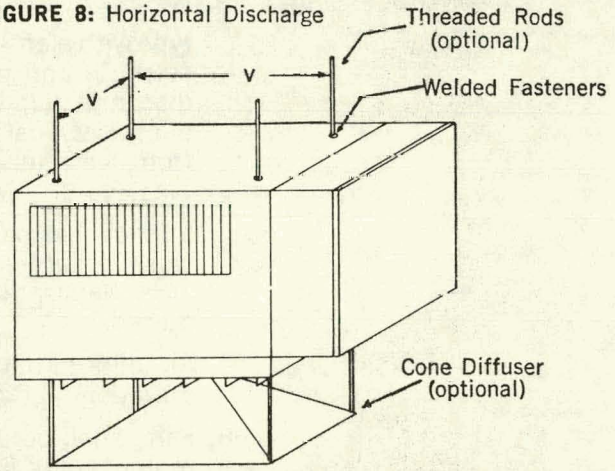

FIGURE 9: Vertical Discharge

application tips

LIMITATIONS—Unit heaters should not be used in potentially explosive atmospheres, nor should they be located where obstructions might block air inlet, motor cooling vents or discharge.

APPLICATIONS—larger rooms require multiunit installations; arrange units to provide perimeter air circulation.

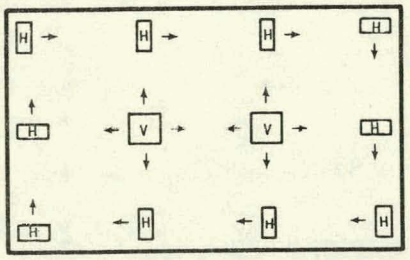

FIGURE 10

To prevent air stratification, the total CFM capacity of all units should circulate the room air volume at least three times per hour.

Unit heaters should be located so their airstreams wipe exposed walls without blowing directly at them. In multiple unit heater installations, it is good practice to locate units so each unit supports the airstream of another, thus setting up a circulatory air movement within the space. Distance between unit heaters should not be less than the throw of one heater nor more than twice its throw; for throw data, see page 5. For interior spaces and for high bay areas, additional unit heaters mounted vertically can be used. In warehouse type applications, where maintaining minimum temperatures is the basic requirement, one or more large unit heaters can be used in order to reduce initial installation expense.

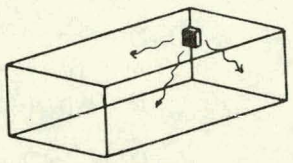

FIGURE 11

Small rooms can be heated by one unit heater. Where two walls are exposed, heater should be mounted as shown.

For individual spaces, total heating capacity is calculated in the conventional way, using formulas in the ASHRAE Guide.

When heating capacity for a pedestrian entryway is unknown, a rule of thumb of 4000 watts per door can be used.

Unit heaters are frequently used to combat cold air inrush when loading dock doors are opened. For such applications, one or more units should be arranged to blow warm air across the opening, not toward it.

other Brasch products

HOT WATER BOILERS – provide hot water for space heating in commercial, industrial and institutional buildings. Recommended for supplying hot water to coils located in hazardous locations. Also used for process applications in industrial plants. UL Listed with ratings to 3600 KW. Ask for Bulletin A120.

STEAM BOILERS – provide steam for space heating in commercial, industrial and institutional buildings or steam for humidification, sterilization and industrial process applications. UL Listed with ratings to 3600 KW, high or low pressure. Ask for Bulletin A124.

ELECTRIC DUCT HEATERS – custom designed for warm air space heating applications in commercial, industrial and institutional buildings, manufactured in unlimited sizes and capacities. Heaters are UL Listed for zero clearance and meet UL and NEC requirements. Ask for Bulletin A102.

ELECTRICAL ENCLOSURES–manufactured to NEMA 1, 3R, 4 and 12 requirements in industry–standard or custom sizes. Available with baked-on epoxy or primer finish. Ask for Bulletin A115.

REMOTE CONTROL PANELS – custom designed, UL Listed, used for the control of Electroduct heating coils and many other types of electric heating equipment. The combination of Brasch panels with Brasch heaters assures you of one-source responsibility and a fully coordinated, prewired, factory tested electric heating package. Ask for Bulletin A105.

STORAGE WATER HEATERS–provide domestic hot water. Standard heaters are available in capacities up to 4000 gallons and 990 KW with lined vessels. Ask for Bulletin A125.

ELECTRIC BASEBOARD HEATERS—provide economical supplementary heat, 187 or 250 watts per lineal foot. UL Listed and NEMA constructed units combine aesthetics with efficiency and strength for comfort heating. Ask for Bulletin A123.

guarantee

BRASCH MANUFACTURING COMPANY, INC. guarantees all electrical components, cabinet and heating elements against defects in material and workmanship for a period of one year from date of purchase. Should any evidence of defects in material or workmanship occur during the guarantee period, Brasch Manufacturing Company, Inc. will repair or replace the part at its own discretion without charge. Brasch Manufacturing Company, Inc. shall not be held responsible for any field charges in connection with the removal or replacement of allegedly defective equipment, nor for incidental or consequential damage. Parts being returned to the factory must arrive prepaid and upon prior approval by the Company.

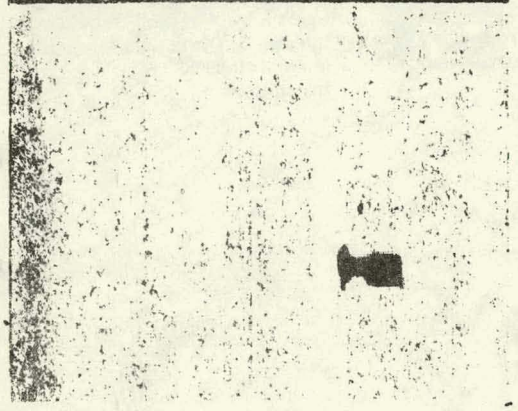
CIRCULATORS & SPECIALTIES



Purpose

Designed to circulate (pump) heated or chilled water, quietly and speedily, in Hydronic Systems for all residences and small commercial establishments. May also be used for zoning large installations and in bronze for fresh water service.

Features

- **Quiet operation**
- **Motor — Rubber Mounted, Overload Protected**
- **One piece, cast impellers for longer life**
- **Leak-proof mechanical seal — two piece type, easily replaced**
- **Stainless steel shaft — hardened and ground**
- **Smooth, safe drive coupling**
- **Easily serviced with ordinary tools**
- **Porous bronze bearings**
- **Permits the use of small size piping**

Operation

1 Supplies heat almost instantly upon a call for heat from the room Thermostat. When the Thermostat is satisfied, the circulator stops and no more heat is delivered to the rooms.

2 When used in conjunction with a Taco Flochek and Water Heater, the same boiler which provides the heating, also supplies domestic hot water all year 'round for kitchen, bath and laundry.

3 For house heating, circulators are available in cast iron construction. For domestic or fresh water circulation, specify bronze construction.

WATTS BACK FLOW PREVENTERS

Tested and Certified under A.S.S.E. Standard 1013

C.S.A. Certified through 1"

No. 900 Series

Reduced Pressure Principle Backflow Preventer

Watts No. 900 Series provides the complete concept in cross connection control for the protection of potable water and it is a unique patented design meeting the specifications of A.S.S.E. Standard 1013 for reduced pressure principle backflow preventers. Also, accepted by U.S. Public Health Service.

Beyond its size, weight, and cost advantages, the No. 900 Series offer many other advantages of value to anyone concerned with efficient cross connection control such as design simplicity, low flow resistance, quiet operation, simplified installation, and servicing.

The No. 900 assembly is the only backflow preventer furnished complete with strainer, test cocks, and gate valves. Its compact, well-balanced, practical design now brings complete protection to thousands of installations which were not economically possible before such realistic considerations were proven and available.

- Union Connections
- Stainless steel internal parts
- Standardly furnished with on body strainer
- Maximum flow at low pressure drop
- Compact size for ease of installation
- Maximum total of 10 parts required for complete service
- Patented double seated First Check Valve

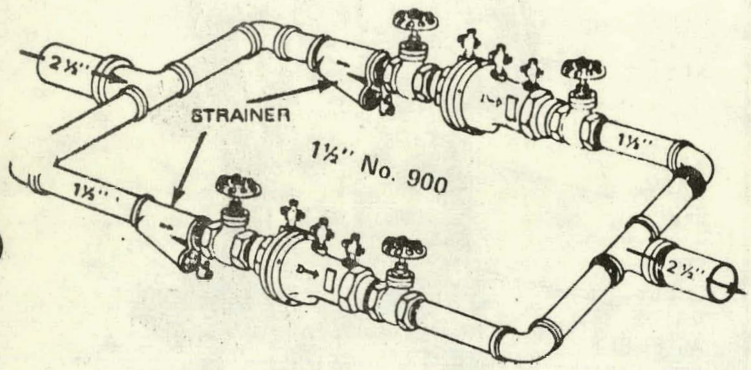
ptional Parallel Installations
using smaller sizes

Optional installation of Series 900 Backflow Preventers is the use of two or more smaller size devices piped in parallel to serve a larger supply pipe main. This type of installation is employed whenever it is vital to maintain a continuous supply of water and where interruptions for testing and servicing would be unacceptable or undesirable. It also has the advantage of providing a total capacity provided by a single larger valve and permits testing or servicing of an individual valve without shutting down the complete line.

For a two valve installation, the total capacity of the devices should equal or exceed that required by the system.

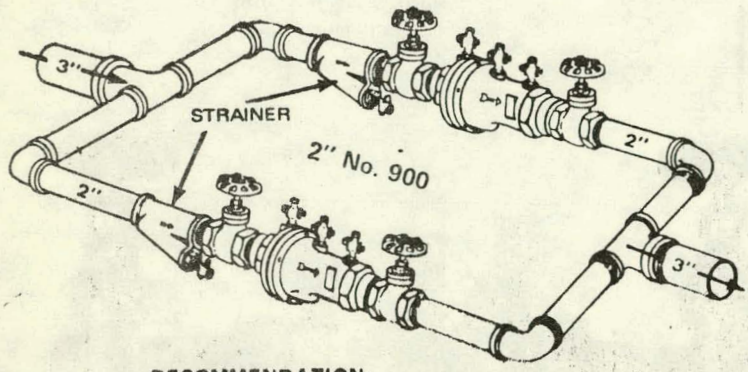
The number of devices and sizes used in parallel should be determined by the engineer's judgement based on the operating conditions of a specific installation.

for 2½" Main Line



RECOMMENDATION:
Install two size 1½" No. 900 to provide a total flow up to 260 GPM. This exceeds the required testing capacity for a single 2½" backflow preventer, based on applicable standards referred to.

for 3" Main Line



RECOMMENDATION:
Install two size 2" No. 900 to provide a total flow up to 350 GPM. This exceeds the required testing capacity for a single 3" backflow preventer, based on applicable standards referred to.

1510.5 HOT WATER HEATERS

(2) 5000 watt heating elements wired for simultaneous operation

208V/1/60

100XL Watts 3/4" T & P relief valve

The attractively styled glass-lined SILVER MONITOR ELECTRIC will deliver an abundant supply of clean, piping hot water throughout years of economical trouble-free service. Its quiet operation and no vent design make it perfect for locating in kitchens, rumpus rooms, finished rooms and the like. Check these advantages.

ECONOMY IN OPERATION!

- Immersed HEATING ELEMENTS transfer heat directly into water for maximum efficiency.
- FIBERGLASS INSULATION forms a positive heat barrier . . . saves fuel!
- COMPACT DESIGN takes less space, enables low-cost installation.

DEPENDABLE LONG-LIFE PERFORMANCE!

- The finest in GLASS LINING for superior tank life and water cleanliness.
- Magnesium ANODE ROD protects tank interior against corrosion.
- Snap-on THERMOSTAT automatically controls water temperature . . . assures continuous trouble-free service.
- UL LISTED All models comply with safety specifications outlined in Underwriters' Laboratories, Inc. Standards for Safety, UL174.
- SUPER STRENGTH TANKS provide long life and that important margin of safety.

CRANE

Five Nonilo

ELECTRIC GLASSLINED WATER HEATERS

■ **GLASSLINED TANKS** The complete inner surface of every tank is lined with an extra thick coating of vitrified glass, permanently bonded under intense heat (1600 F.) to insure clean, rust-free water throughout a longer tank life.

■ **SPECIAL ECO (Energy Cut-Off) FEATURE** A special UL listed, factory installed heat sensitive device cuts off **ALL** power to heater should tank water temperature reach 210 F.

■ **ANODE ROD** Extruded magnesium rod suspended in the tank protects your heater against corrosion.

■ **HIGHLY EFFICIENT THREADED ELEMENTS** Immersion type heating elements put all heat directly into water for greater efficiency. Pressure sealed to prevent leaking.

■ **WELDED STEEL COUPLINGS** No internal threads to cause nipple leaks.

■ **T. & P. VALVE OPENING** Separate ¾" N.P.T. opening provided for installation of Temperature-Pressure relief valve. Maximum Hydrostatic Working Pressure 150 PSI.

■ **TRIPLE TESTED TANKS** Each tank is carefully tested three times during manufacture.

■ **FIBERGLASS INSULATION** An extra dense blanket of non-settling fiberglass surrounds tank and keeps heat loss to minimum — saves fue

■ **SET AND FORGET THERMOSTAT CONTROL** Once the thermostat is properly set, you get a constant supply of hot water at your desired temperature.

■ **UL LISTED** All models comply with Safety Specifications outlined in Underwriters' Laboratories, Inc. Standards for Safety, UL174.

In keeping with our policy of continuous product improvements, we reserve the right to make minor changes without prior notice.

SOLARON CORPORATION

Solar Energy Systems

Solar AIR heating systems produce more usable energy than liquid solar systems. An independent test of side by side air and liquid solar systems at Colorado State University states: ". . . the air system operated 45 percent longer during the day than the liquid system and collected 38 percent more heat." "This is a consequence of stratified heat storage in the pebble bed for the air system and nearly uniform temperature in the water storage tank of the liquid system." This is described in terms of the solar system performance equation on page four of this brochure.

The SOLARON AIR COLLECTOR offers the following advantages:

- 10 Year performance warranty.
- Safe, reliable and virtually maintenance-free operation.
- Freedom from damage by freezing or boiling.
- Absence of pipes which can corrode and leak.
- Requires no antifreeze or stagnation pressure relief controls.
- Approved by HUD and ERDA for Federally funded projects.

MR—MANUFACTURER

Solaron's business is the practical application of solar energy. We design, manufacture and market solar heating systems for industrial, commercial, agricultural process drying and residential buildings. The heart of our system is the air-type solar collector, a design based on over 30 years research and development by Dr. George Löf. To contact the nearest Solaron dealer, call the SWEETS BUYLINE.

Design Assistance: Solaron has a complete design manual covering all aspects of solar system engineering, architectural requirements and economics. Contact Solaron for a copy of the design manual. Experienced and technical personnel are available to assist on any special applications.

The Solar Air Heating System

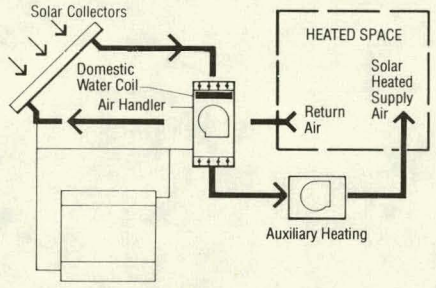
SOLARON CORPORATION T.M.

The Solaron solar heating system is marketed throughout the U.S. by local distributors and dealers who are well established in the HVAC industry. The Solaron distributors maintain a complete stock of Solaron equipment. The distributors, who also handle major brands of heating and air conditioning equipment, work with dealers who are HVAC installing contractors. The Solaron dealers are established and reliable contractors who are familiar with installing heating equipment and associated ductwork. Both the distributors and dealers are thoroughly trained by Solaron in all aspects of solar heating, design, equipment application and installation. Solaron engineers and field servicemen support the distributors and dealers as required, and provide on site assistance.

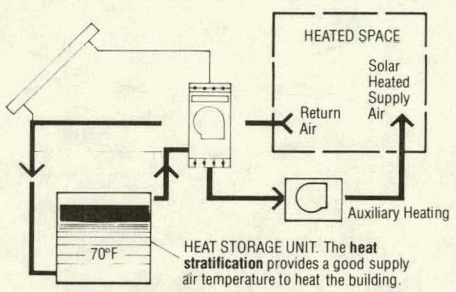
The Solaron collector, air handler and controller and necessary ductwork is installed by the HVAC contractor. The general contractor usually builds the heat storage container. The system is then tested through all of the operating modes and thoroughly checked for proper operation.

OP—OVERALL PRODUCT, IN PLACE

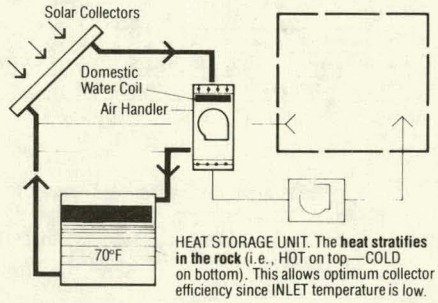
SYSTEM OPERATION



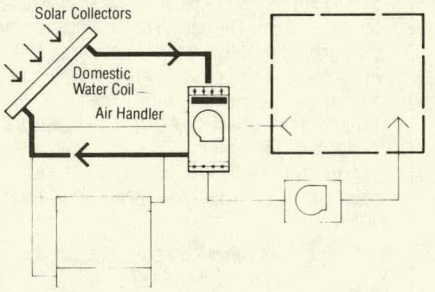
HEATING FROM COLLECTOR Air, the circulating heat transfer medium is drawn through the collector where it is normally heated to about 120-150°F. When the space requires heat, the solar heated air is drawn through the air handling unit in which motorized dampers are automatically opened to direct the hot air to the space. The air then returns to the collector where it is again heated and the cycle repeats itself.



HEATING FROM STORAGE At night or on cloudy days when solar energy is unavailable and when heat is needed in the space, the automatic control system directs the building return air into the bottom of the heat storage unit, up through the pebbles where the air is heated, through the air handling unit and into the space. When the solar heated air does not maintain the space thermostat setting, the automatic control turns on the auxiliary heater to add to the required heat.

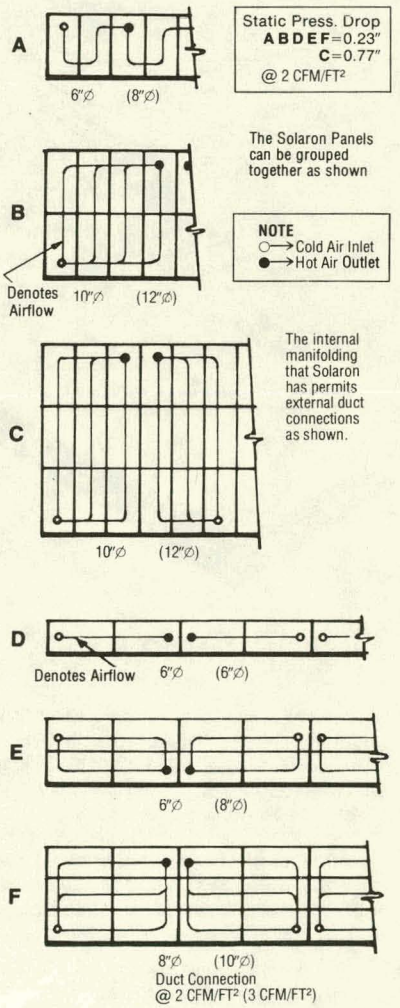


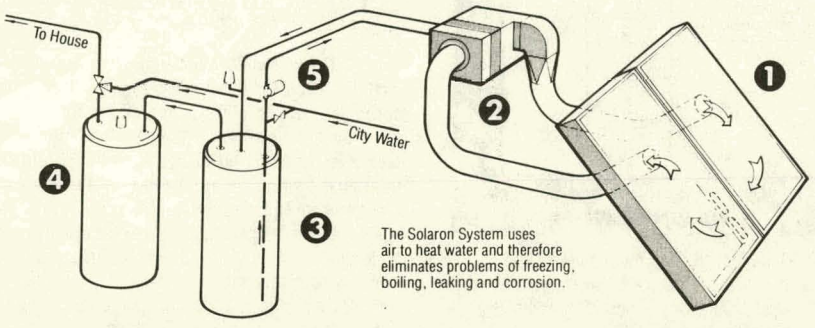
STORING HEAT When the space temperature is satisfied the automatic control system diverts the air into the heat storage unit where the heat is absorbed by the pebble bed. The air returns to the collector where it is heated and this cycle is repeated.



SUMMER WATER HEATING In the summer, when space heating is not required, air is drawn through the collector where it is heated and then through the water heat exchanger coil. The solar heated air transfers its heat to the water which is being circulated through the coil and the air is then returned back to the collector inlet.

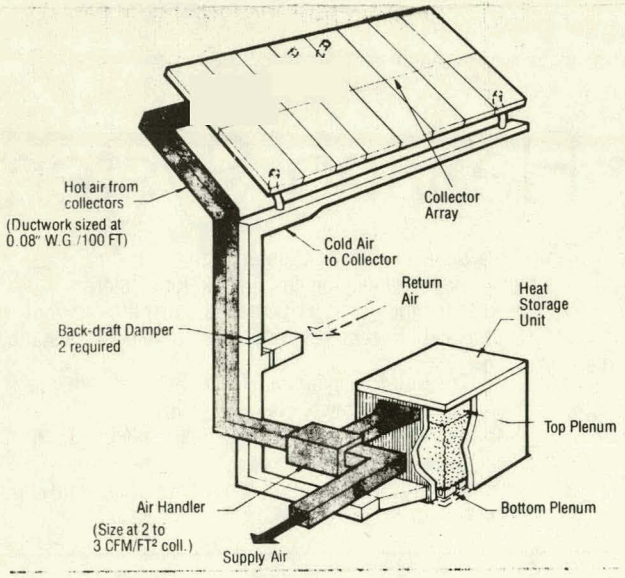
TYPICAL COLLECTOR ARRAYS





SOLARON DOMESTIC WATER HEATING SYSTEM

The Solaron Domestic Water Heater System involves a very simple operating cycle. Solar energy is collected by the south facing collector **1**. Air is circulated by the heat exchange unit **2** where the solar energy is transferred to the water being circulated by the domestic water circulating pump **5**. Solar heated water is continuously circulated into the storage tank **3** as long as the Solaron control unit indicates that solar energy is available at the collectors **1** and until tank temperature in the storage tank **3** reaches 160 degrees F. When hot water is required water is drawn from the conventional domestic hot water heater **4** and preheated water is drawn from the storage tank **3** into the conventional domestic water heater.



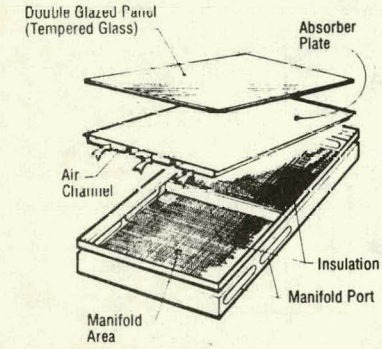
GENERAL SYSTEM DESCRIPTION

A drawing of a typical installation is shown to the left. The collectors can be grouped as shown or in any of the configurations shown on page 2, Typical Collector Arrays. Due to the Solaron internal manifolding technique (i.e. air flow from one panel to another internally) the external duct connections are minimized as shown above (i.e. one inlet and one outlet for 8 panels, 156 ft.²). This technique reduces field labor and leads to an economical installation.

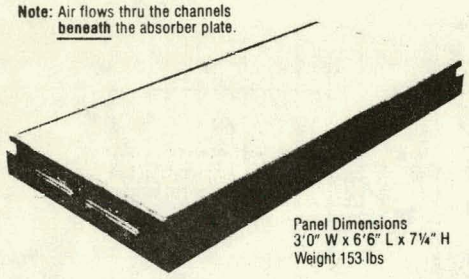
CONTACT SOLARON TO OBTAIN SYSTEM SCHEMATICS SHOWING HOW TO COMBINE SOLAR HEATING WITH:

- Heating & air conditioning
- Heat pumps
- V.A.V. systems
- Multiple zones
- Process water heating
- Make-up air heating
- Process air htg-drying
- Swim pool water htg.
- Industrial & agricultural heating

CP—COMPONENTS, PARTS



Note: Air flows thru the channels **beneath** the absorber plate.



SOLARON COLLECTOR PANEL DETAILS (patents applied for)

The Solaron solar collector is an advanced type of an air heating, flat plate collector. Our exclusive internal manifolding allows the Solaron collector to be completely modular. Factory preassembled collector panels are plugged into each other with a minimum of installation time. Air inlets and outlets are field cut into each collector array as required. The Solaron solar collector is designed for installation on any structurally sound surface, such as a roof, wall or specially made supports.

The Solaron solar collector has the following general construction characteristics:

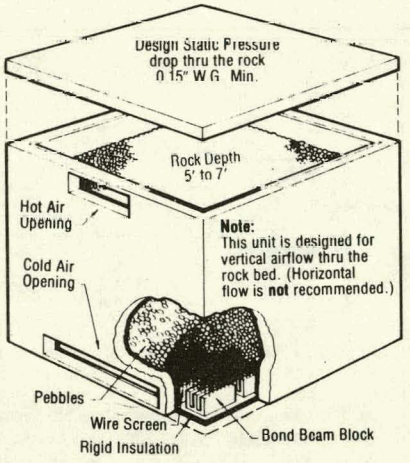
Absorber: 28 gauge steel with porcelain enamel coating.

Glazing: Two ⅛" sealed special low iron tempered glass panels with a long life EPDM perimeter gasket. Glass plate can be easily removed for service or replacement.

Pan: 20 gauge steel, fully insulated with 3¾" fiberglass batt. Painted external surfaces.

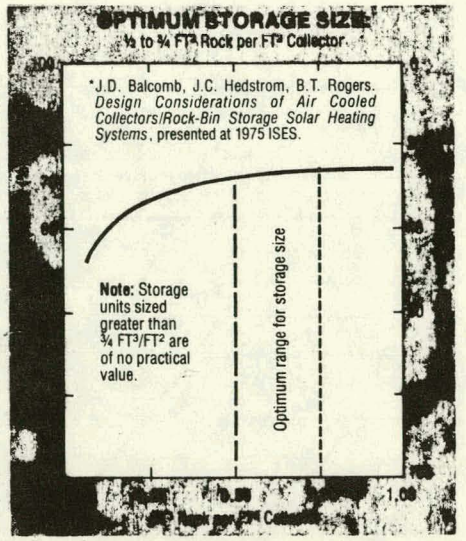
Connection Ports: Unique flange configuration permits tight air seal automatically as modules are installed.

Cap Strip: Painted steel designed to provide weather seal between panels.

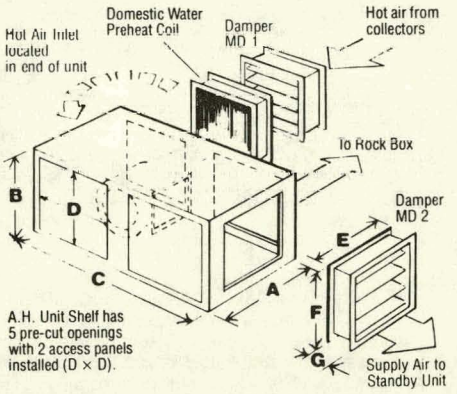


PEBBLE-BED HEAT STORAGE UNIT

The use of pebbles in the heat storage unit is particularly effective with an air circulating solar heating system. The pebble bed maintains a steep temperature stratification (i.e. hot on top and cold on the bottom). This allows air to be provided at the highest available temperature to the heated space from the top of the pebble bed. It also allows air to return from the bottom of the bed to the collector at essentially room temperature. This ensures maximum efficiency of solar heat collection and delivery.



The heat storage unit must be built and installed by the local contractor to Solaron standard drawings and specifications. Contact Solaron for a copy of these specs.



Model No.	Air Handling Unit (in.) A	B	C	D	Dampers & Coil E	F	G	C.F.M. Range at 1.2" S.P.
AU—0400	20	18	42	14	16	16	8	300 to 1400
AU—0500	24	22	51	18	20	20	10	1200 to 2400
Larger, custom built air handlers are also available.								

AIR HANDLING UNIT

Solaron provides a standard factory preassembled air handling unit, including a blower, and motor driven dampers. A separate damper pair is furnished for mounting in the duct system, (i.e. backdraft dampers).

A typical installation for the air handling unit, near the auxiliary heater and heat storage, is shown in the General System Description (upper left). The air handler can be mounted either vertically or horizontally, and with proper orientation and clearance to receive all connecting ducts without interference.

SOLARON AUTOMATIC CONTROL UNIT

The automatic temperature control unit is included as part of the Solaron system. The controller handles all of the operational modes which are shown in the schematics on page 2. The controller operates the solar side of the system and ties into a 2-stage thermostat to provide solar and/or auxiliary heat to the space as required. The standard controller can be modified (with Solaron hardware) to combine with heat pumps or other types of auxiliary heating systems. Solaron can provide technical assistance to design special controllers for large projects or special applications.

OP—OVERALL PRODUCT, IN PLACE

SOLAR *SYSTEM* PERFORMANCE COMPARISON

Comparison of various types of solar heating systems can only be done properly if the entire solar *system* is evaluated over an *entire heating season*. Collector efficiency is an instantaneous point in time measurement and is not a valid parameter to evaluate the solar system performance. The ideal situation for a solar system is to keep the fluid inlet temperature to the collector as low as possible and have a high usuable temperature for space heating. Therefore, the ideal solar system has heat stratified in the storage unit. An air solar system using rocks as the thermal storage provides this stratification. Therefore, the inlet temperature to an air collector is typically 70°F where the liquid collector inlet temperature is 130°F.

$$\frac{Q_U}{A_C} = F_R[\bar{H}_T \tau\alpha - U_L(T_i - T_a)] = \frac{BTU}{Ft.^2\ Day}\ *$$

gains | losses

Two collectors of similar construction can be compared using the performance equation. When the average collector inlet temperature (T_i) is used, the liquid systems produce almost the same heat output as the air system.

$$\text{AIR: } \frac{Q_U}{A_C} = 0.69[(300)(0.75) - (0.8)(\mathbf{70}° - 40°)] = 139 \frac{BTU}{Ft^2\text{-}Day}$$

$$\text{LIQUID: } \frac{Q_U}{A_C} = 0.90[(300)(0.75) - (0.8)(\mathbf{130}° - 40°)] = 138 \frac{BTU}{Ft^2\ Day}$$

However, this is still an instantaneous point in time measurement which doesn't take into account the fact that the air system will typically collect for longer periods of time and therefore deliver more total heat output. When these systems are evaluated over an entire season, the results are as reported by the C.S.U. report #C00-2868-1. Because of the stratification, the temperature of the air returning to the collector from the bottom of storage is always near room temperature. Thus, the air collector can deliver useful heat from early morning to late afternoon; the liquid system starts up later in the morning and shuts off earlier in the afternoon . . . Therefore, when *system performance* is evaluated over an *entire season* it shows that *AIR solar systems actually produce more usable energy than liquid systems*. The C.S.U. tests report that the air solar system delivered considerably more heat output than the same sized liquid system right next to it.

*Ref. Hottel, H.C. and Woertz, B.B. A.S.M.E. Transactions 64, 91 1942 *Performance of Flat Plate Solar-Heat Collectors*

PRELIMINARY SIZING CRITERIA

1. Solar Collector Area: The collector area can be determined by using the Solaron Conversion Factors shown to the right. The design heat loss is divided by the S.C.F. to get ft² of collector. Recommendations—Annual fuel savings for space heating should equal 30% to 70%. Annual fuel savings for applications with a more uniform load throughout the year can be higher than 70%.
2. Air Flow Rate: 2 SCFM to 3 SCFM per ft² of solar collector area. Contact Solaron for special applications such as make-up air heating, outside air heating for drying or industrial or agricultural process heating.
3. Heat Storage Size: ½ to ¾ ft³ rock per ft² of solar collector area. Rock size ¾" to 1½" diameter.

SELECTION EXAMPLE

Given that: A commercial building with a design heat loss = 136,800 BTU/HR, the location is Denver, Colorado and the desired annual fuel savings is 50%.

1. Collector Area = (Design heat loss) ÷ (S.C.F.) = 136,800 ÷ (171) = 800 ft² collector.
2. FLOW Rate = (2 SCFM per ft²) × (Collector Area) = (2) × (800) = 1600 SCFM.
3. Heat Storage Unit = (½ ft³ rock per ft²) × (Collector Area) = (½) × (800) = 400 ft³ rock.

CORRECTIONS FOR NON/OPTIMUM CONDITIONS

Example: Project at 40° N. Latitude, 500 ft² Collector Area.

1. If Orientation is 20° to the West: The relative collector area required to provide the same annual fuel savings as a system at due South is approximately 1.04 times the calculated collector area. (1.04) × (500) = 520 ft².
2. The optimum collector tilt would be 45° to 55° (i.e. L + 5 to L + 15). If the collectors were at a tilt of 35° (i.e. L − 5) the relative collector area required would be 1.03 × 500ft² = 515ft². If both conditions exist (i.e. 20° West & 35° tilt) the correction would be (1.04)(1.03)(500) = 535.6 ft².

SOLARON CONVERSION FACTORS

Solar collector area = (design heat loss $\frac{BTU}{HR}$) ÷ (S.C.F.) = Ft²

SOLARON CORPORATION ™

TECHNICAL DATA
Series 2000
Air Type Solar Collector

PATENTS PENDING

The Solaron series 2000 flat plate air type collector represents the most advanced technology and manufacturing know-how available today in the solar heating field. The collector is based on over thirty years of research and testing and has proven highly efficient, reliable and maintenance free.

The collectors are completely factory pre-assembled to minimize field installation time and assure uniform quality and performance. The exclusive port and manifold system allows the collectors to be simply butted together and bolted in place. No field fittings are required between collectors.

The Solaron series 2000 collector is universal in application. Substantial energy savings can be realized in commercial, industrial and residential applications such as:

- MAKEUP AND FORCED AIR HEATING
- HYDRONIC SPACE HEATING
- DOMESTIC HOT WATER HEATING
- PROCESS HOT WATER APPLICATIONS
- PROCESS HOT AIR DRYING APPLICATIONS

The Solaron System can be used where application temperatures can be satisfied directly by the collectors as well as where the collectors are used to preheat air or water for high temperature applications.

The Solaron series 2000 collector conforms to the interim performance standards established by the Energy Research and Development Administration for solar collectors. These standards include:

- RESISTANCE TO HAIL, WIND FLUTTERING AND WIND LOAD.
- FREEDOM FROM FREEZING, CORROSION, AND OUTGASSING.
- RESISTANCE TO THERMAL AND SOLAR DEGRADATION.
- CONFORMITY TO NATIONAL SAFETY AND FIRE CODES.

FEATURES

- The Solaron series 2000 air type collector can be used in hydronic applications through the use of a high efficiency air to water heat exchanger. Since the collector uses air as the transfer medium, costly field piping, maintenance and wear are reduced or eliminated.
- Attractive appearance allows for architecturally pleasing applications, including construction of entire roofs and wall sections with solar panels.
- Factory preassembly includes insulation, manifolding and glazing to eliminate field assembly.
- Simple installation system includes all hold down hardware and cap strip necessary for a complete installation. Perimeter flashing, typically field measured is provided by the builder.

CONSTRUCTION

The series 2000 collector module, designed for high efficiency and ease of installation, is constructed of the following materials:

PAN - 24 gauge steel, fully insulated with 3-3/4" fiberglass batt. Painted external surfaces.

COVER PLATES - Two 1/8" hermetically sealed special low iron tempered glass panels with long life neoprene perimeter gaskets. Plates can be easily removed for service or replacement.

ABSORBER - 28 gauge steel with baked on high absorbency ceramic enamel coating.

CAP STRIP - Painted steel. Designed to assure weather seal between modules.

CONNECTION PORTS - Unique flange configuration permits tight air seal automatically as modules are installed.

PERFORMANCE

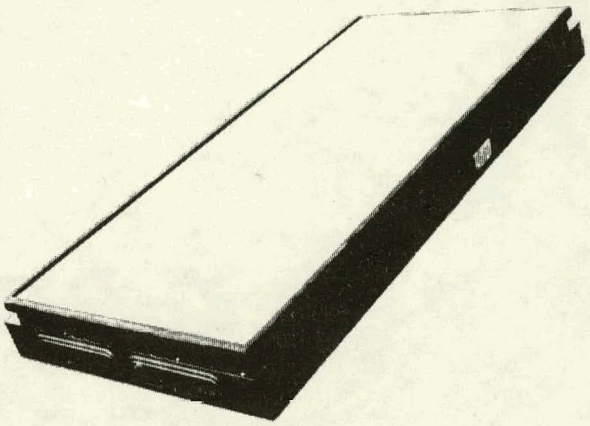
EFFICIENCY - collector efficiency is as high as 64.5% as a function of outlet minus ambient temperature over solar insolation. Where $T_{out} - T_{amb}$ equals 120° and insolation equals 300 BTU's per hour per square foot, a typical operating environment, the Solaron series 2000 collector efficiency exceeds that of flat plate liquid type collector.

REFLECTANCE - the total reflectance of the absorber surface averages only about 5%.

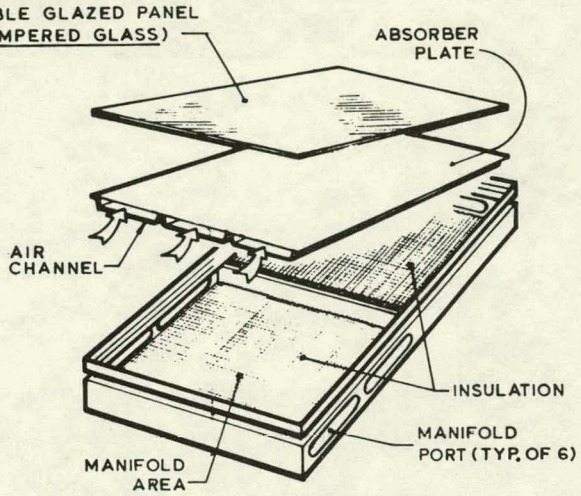
COVER TRANSMITTANCE - the transmittance of the two plate, low iron tempered glass cover is 80 percent from a 0 to 48 degree angle of solar incidence.

HEAT DELIVERY - the excellent heat delivery characteristics of the Solaron series 2000 collector are shown on Figure 3.

SOLARON COLLECTOR PANEL DETAILS



COLLECTOR PANEL



PANEL DIMENSIONS
3'-0"W x 6'-6"L x 7¼ H

NOTE: AIR FLOWS THRU THE CHANNELS BENEATH THE ABSORBER PLATE

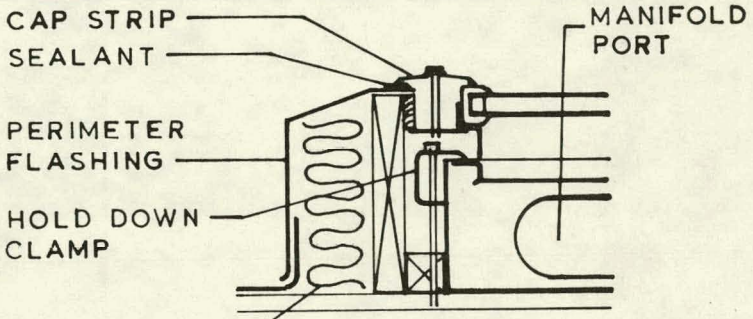
NOTE

THE SERIES 2000 COLLECTOR IS AVAILABLE IN 3 MODELS:

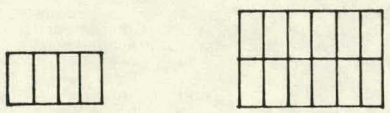
2001 – STD. FOR 2 PANELS HIGH

2002 – OPTIONAL FOR MIDDLE ROW OF 3 HIGH ARRAY AND SPECIAL CONFIGURATION

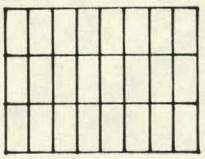
2003 – STD. FOR 1 PANEL HIGH



EXTERIOR MOUNTING SYSTEM



2003 2001



2001
2002
2001

COLLECTOR PANELS MAY ALSO BE GROUPED IN HORIZONTAL CONFIGURATION

The Solaron series 2000 collector is flexible in application. The modules can be installed on a roof section, wall section or free standing roof frame.

The collectors are installed as shown in the mounting system details above. Return and supply air is provided by simply installing a standard starting collar on the bottom of the collector anywhere within the 29" × 36" manifold area, thus collars can easily be located to clear roof trusses or wall studs. Perimeter flashing is field measured and installed to complete the system.

Other product information:

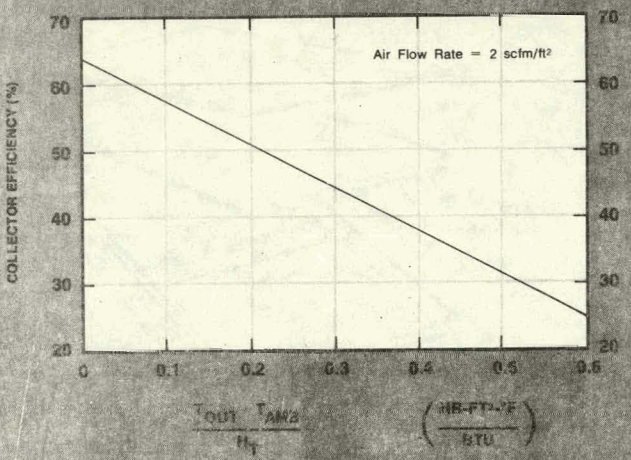
COLLECTOR WEIGHT - 183 pounds

INSTALLED DIMENSIONS - 36" × 78", center to center

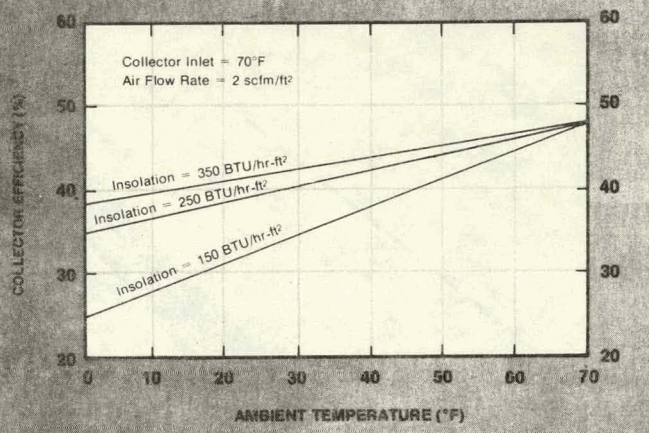
PORT NET FREE AREA - 26.7 square inches each

PORT END CAPS - provided by Solaron as required

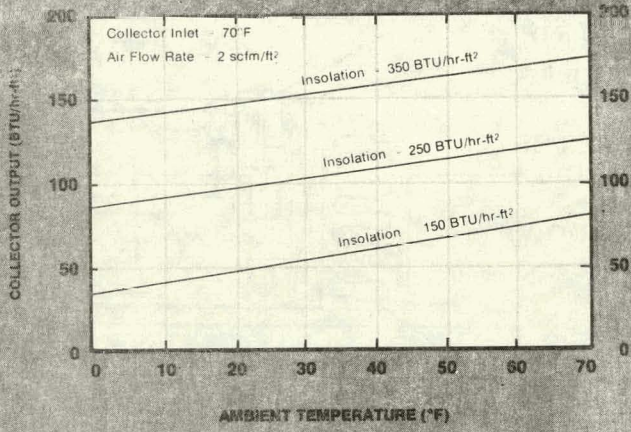
MEASURED*
COLLECTOR PERFORMANCE DATA



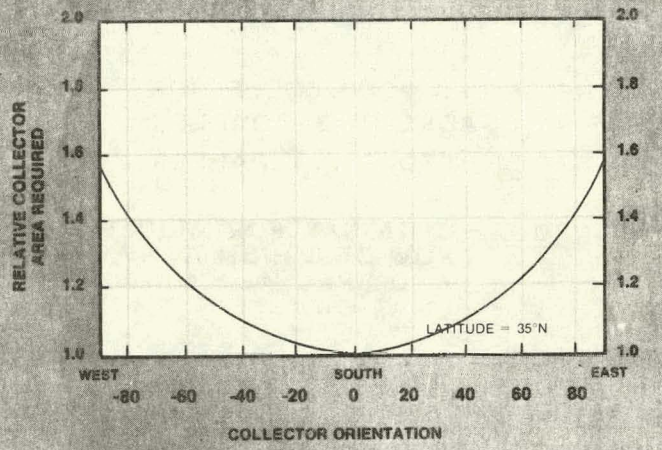
A—Collector efficiency as a function of outlet minus ambient temperature over insolation.



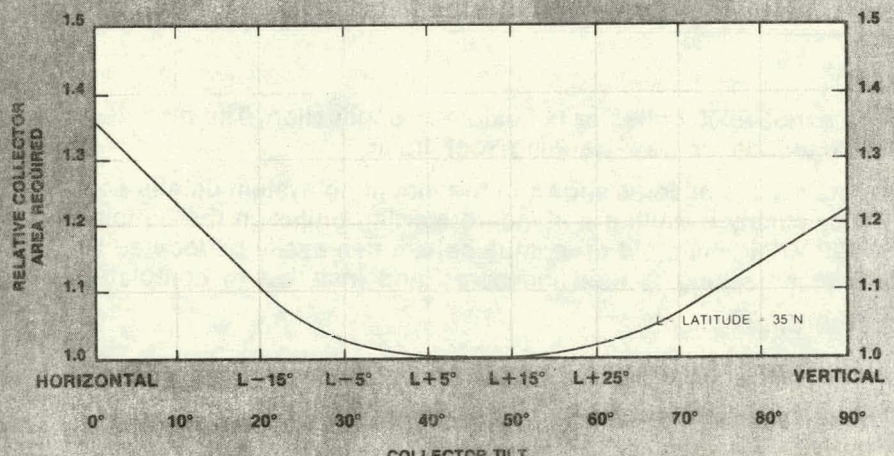
B—Collector efficiency as function of outdoor temperature for various solar inputs.



C—Collector heat delivery as a function of outdoor temperature for various solar inputs.



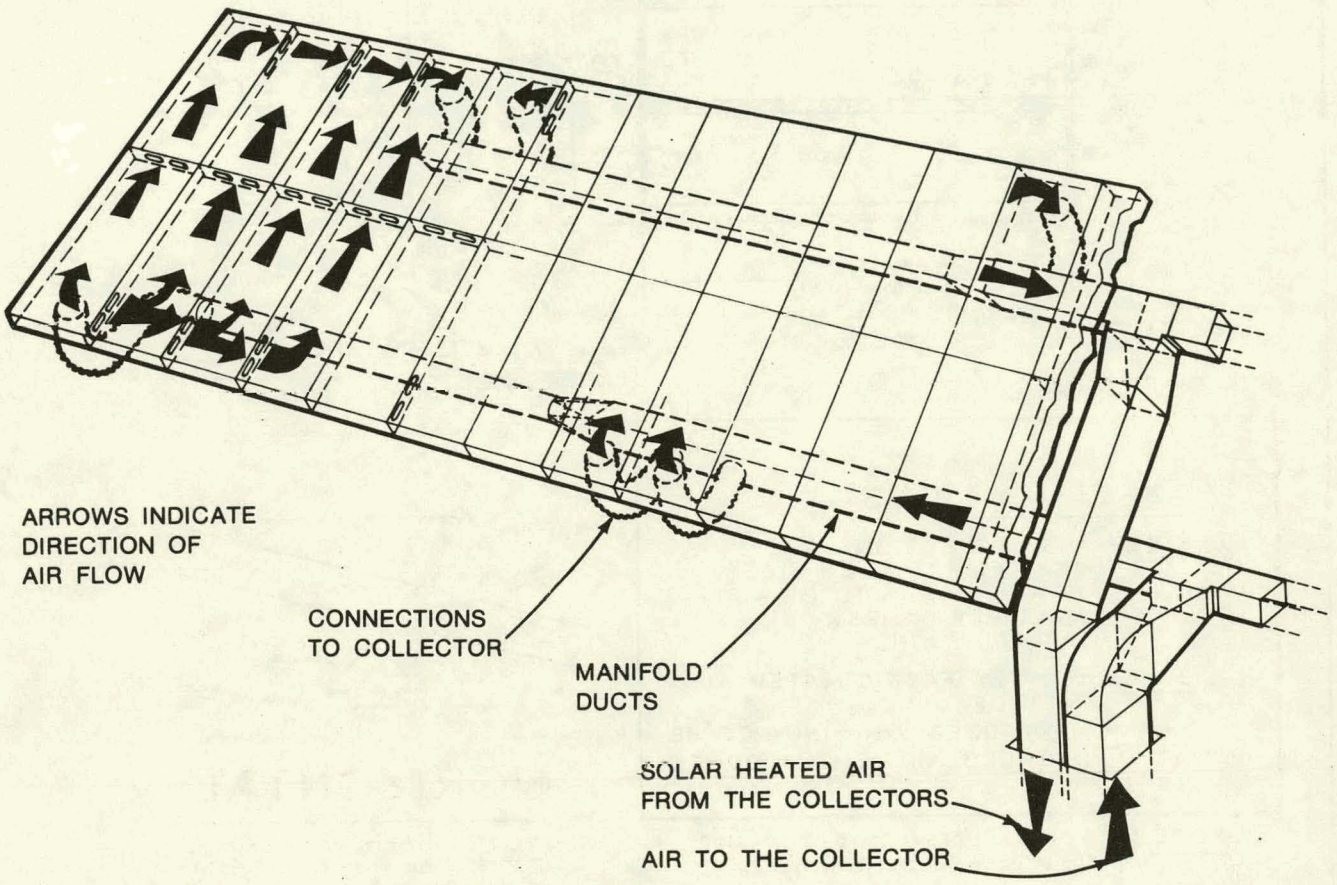
D—Effect of collector orientation on total system performance of a typical installation at 35° N latitude. *(J. D. Balcomb, J. C. Hedstrom, B. T. Rogers "Design Considerations of Air Cooled Collector/Rock-Bin Storage Solar Heating Systems," presented at 1975 ISES Los Angeles Meeting, Aug. 1975)*



E—Effect of collector tilt on total system performance for a typical installation at 35° N latitude *(J. D. Balcomb, J. C. Hedstrom, B. T. Rogers "Design Considerations of Air Cooled Collector/Rock-Bin Storage Solar Heating Systems," presented at 1975 ISES Los Angeles Meeting, Aug. 1975)*

*Measured in accordance with NBS IR-74-635 "Methods of Testing for Rating Solar Collectors Based On Thermal Performance"

TYPICAL COLLECTOR INSTALLATION



The Solaron series 2000 solar collector can be installed in either a horizontal or vertical position. Installation can be efficiently accomplished by a two-man crew. No special tools or installation techniques are required.

The optimal air flow rate through the collector is 2 SCFM/ft.^{2}. The design static pressure is 0.23" when the collectors are ducted as shown above.

On a special order basis, Solaron can provide collectors with precut manifold openings and manifold ports omitted where specified to further reduce field installation time.

Solaron Corporation provides mechanical engineering and field services to assist the local engineer and HVAC contractor in design and installation.

For additional information on the Solaron collector and related Air Handling and Automatic Control systems, contact Solaron Corporation Marketing Services.

PROJECT: FIRE STATION No. 24
LOCATION: KANSAS CITY, MISSOURI
ARCHITECT: MIDGLEY, SHAUGHNESSY, FICKEL & SCOTT
ENGINEERS: AEC INC.
SUB. CONTR: TRUOG & NICHOLS, INC.

EQUIPMENT SCHEDULE

ROOF EXHAUSTERS (EF-1 & 2)
PENN LC Dynafans, low contour type, aluminum housing, with 115/60/1 motors, adjustable V-belt drive and disconnect switch.

1 - EF-1: LC-16A, 1/4 H.P., single speed, with 115 volt motor operated back-draft damper; 1050 cfm @ .375" S.P., 870 RPM.

1 - EF-2: LC-16A, 1/3 H.P., two speed, with gravity backdraft damper and hinged sub-base; 900 cfm @ .5" S.P., 950 RPM.- mech contr responsible for connecting to separate spare circ in panelbd. 120V.

WALL EXHAUSTERS (EF-3 & 4)
2 - PEERLESS Model PVH-18 direct drive with 1/2 H.P., 115/60/1 motor, aluminum fan blade, wire inlet guard, and 20 x 20 RUSKIN BD2A2 back-draft damper (front flange frame); Capacity: 3825 CFm @ .375" S.P.

CONTROLS
3 - (EF-1,3 & 4) C-H 9101H92 flush manual starters with overload protection, pilot light and stainless steel flush plate.
1 - (EF-2) C-H 9106H14, flush 2 speed starter, with overload protection on both speeds, pilot light and stainless steel flush plate.

CURBS & EQUIPMENT SUPPORTS
2 - PATE PC-5A, with 2" raised cant, 23.5" square O.D. (EF-1 & 2)
6 - PATE ES-5A, with 2" raised cant, 42" long. ← not reqd - by ch. order.

LOUVERS & DAMPERS - RUSKIN MFG. CO.
2 - 60 x 24 L-5, galv. with 1/2" mesh , 16 ga. galv. birdscreen on rear, channel frame.

BACK-DRAFT DAMPER
NMS non-metallic, steel channel frame.
1 - 15 x 14. 2 - 24 x 18.

MANUAL DAMPERS
3 - 10 x 10 MD-35-OBC, with extended shaft for quadrant.

FIRE DAMPERS - Horinontal
IBD2 - A frame, UL, 212° fusible link.
2 - 26 x 16. 2 - 26 x 20. 1 - 17 x 16. 1 - 16 x

AIR DISTRIBUTION EQUIPMENT - TITUS PRODUCTS
SD: TDC-S1, #25 white finish, with AG-95 damper.
2 - 6 x 6, 1S. 4 - 9 x 9,3A. 1 - 9 x 9, 2G.
1 - 9 x 9, 4A. 2 - 12 x 12,3S. 3 - 12 x 12, 4A.
1 - 12 x 12, 1S. 1 - 12 x 12, 2G.

SR: 272-RS-5, #25 white finish.
2 - 18 x 12. 4 - 22 x 8. 1 - 26 x 12.

RG: 25-RL, #25 white finish.
1 - 10 x 10. 1 - 12 x 12. 1 - 16 x 16. 1 - 18 x 12.
1 - 24 x 20. 1 - 26 x 26. 1 - 48 x 36.

ER: 25-RL-5, #25 white finish.
2 - 8 x 6. 1 - 12 x 10. 1 - 12 x 12.

AER: 4-FL-5, #25 white finish.
3 - 8 x 6.

OG: 4-FL, #25 white finish.
3 - 10 x 10.

EXTRACTORS: AG-45
#2 operator: 2 - 8 x 6. 2 - 8 x 8. 1 - 11 x 6. 1 - 14 x 6. 2 - 14 x 7.
#1 operator: 2 - 22 x 8.

BACKDRAFT DAMPER
Aluminum

TYPE ~~BD2/A1~~ BD2/A2

STANDARD CONSTRUCTION

FRAME: 6063T5 extruded aluminum .090" wall thickness. Mitered corners.

LINKAGE: 1/8" x 1/2" aluminum tie-bars concealed in frame.

MAXIMUM SIZE:
Single section — 40"w x 48"h
Assembly of sections — size unlimited.

MINIMUM SIZE: 6"w x 6"h

TEMPERATURE LIMITS:
-40°F to +200°F

FINISH: Mill

~~**BD2/A1**~~
~~(Spot velocities up to 1500 fpm)~~

~~**BLADES:** .025 formed aluminum with extruded vinyl edge seals.~~

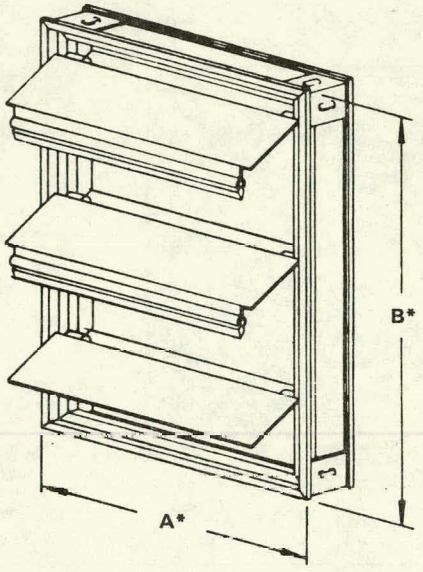
BEARINGS: Valox

BD2/A2
(Spot velocities up to 2500 fpm)

BLADES: 6063T5 extruded aluminum .050" wall thickness with extruded vinyl edge seals.

BEARINGS: "Cycoloy 800"

Note: When used in fan discharge applications, damper should be located at least ½ fan diameter from fan discharge.



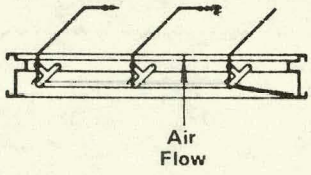
FEATURES

BACKDRAFT PROTECTION:
Low leakage:
Less than 12 CFM/sq. ft. at ½" w.g.

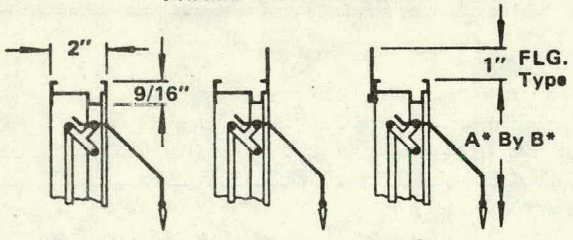
WEATHER RESISTANT:
Blades overlap frame.

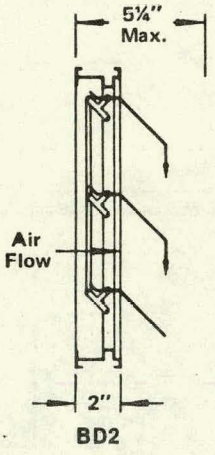
QUIET OPERATING:
Non metalic blade to blade seal.

APPEARANCE:
Good looking — contemporary styling.



FRAME CONSTRUCTION





HORIZONTAL MOUNT — AIR FLOW UP
(Not available in air flow down)

HORIZONTAL DAMPER

FEATURES

BLADES: Exceptionally strong & tear resistance. Virtually Inert–is unaffected by mildew or rot. Fire resistant–self extinguishing. Will not support combustion. Waterproof–does not absorb moisture. Resist most oils, chemicals & grease. Temperature range: 40°F to 190°F.

SUPER–SENSITIVE ACTION: Opens on slightest movement of air.

QUIET: No metallic noises.

SEALS EASILY: For the best back draft protection.

NO MECHANICAL PIVOTS: Means long dependable operations.

OVER 60% FREE AREA.

*Unit furnished approx. ¼" smaller than given 'opening' dimensions.

MANUAL DAMPER

TYPE MD 35

STANDARD CONSTRUCTION

FRAME: 3½" x 7/8" 18 ga. galv. steel channel

BLADES: 6" width 18 ga. galv. steel on approx. 6" centers.

LINKAGE: Concealed in frame.

BEARINGS: Cycoloy 800.

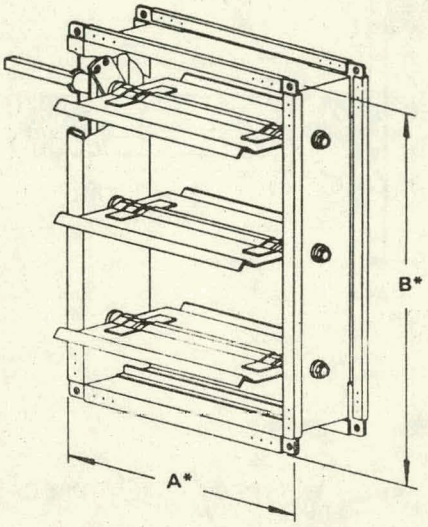
AXLES: ½" Hex.

CONTROL SHAFT: 3" x 3/8" sq. plated steel.

MAXIMUM SIZE: 48"w x 46"h

MINIMUM SIZE: OB—6"w x 11"h (2 blades) PB—6"w x 8"h (1 blade)

For sizes larger than maximum or smaller than minimum, use Model CD-35.



FEATURES

STEEL CONSTRUCTION: "INTERLOCKING DESIGN" Entire unit locked together without bolts, screws, or rivets to shake loose.

BEARINGS: "Cycoloy 800," non stick and non corrosive, assures long life and ease of operation.

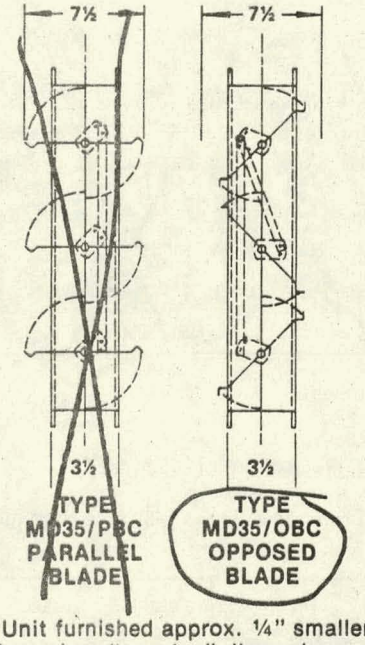
LINKAGE Shake proof. Low maintenance.

AXLES: Positively locked to blade. No screws or welds used, will not shake loose.

FRAME CORNERS: Internally braced to reduce racking.

CUSTOM TAILORED: To fit any size opening.

Standard construction only available.



*Unit furnished approx. ¼" smaller than given "opening" dimensions.

NOTE:
For proper operation all dampers must be installed square & free from racking.

FIRE DAMPER
CURTAIN TYPE INTERLOCKING BLADE

TYPE
IBD2

STANDARD CONSTRUCTION

FRAME: 4½" galvanized steel channel.

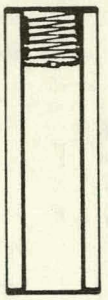
BLADES: Interlocking type galvanized steel.

ENCLOSURES: 18 gage steel (Types B, C, CO, & CR).

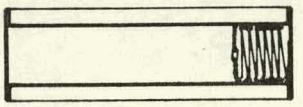
FINISH: Mill galvanized.

FUSIBLE LINK: 212°F Standard. 160°F available at no additional cost.

MOUNTING: Vertical or Horizontal.



VERTICAL MOUNT



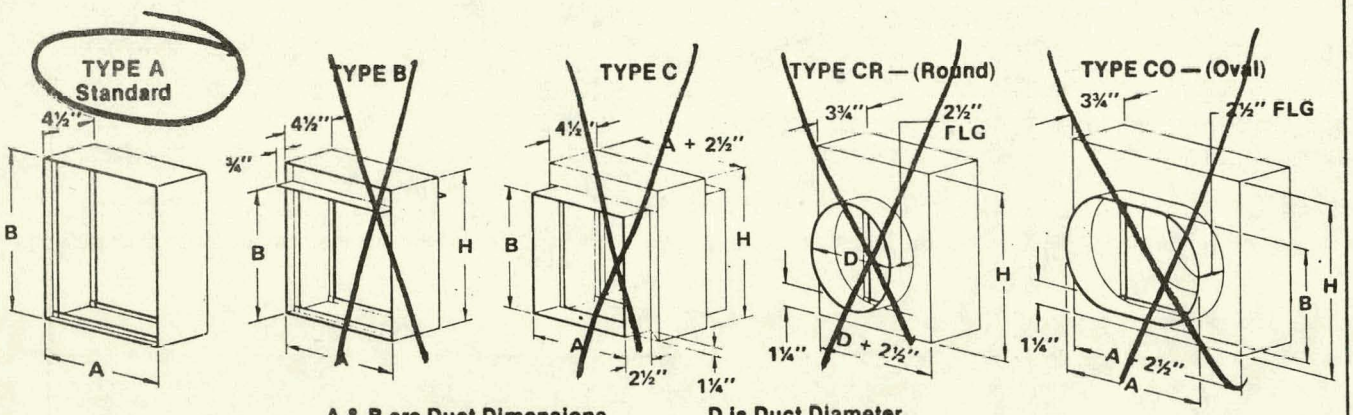
HORIZONTAL MOUNT

FEATURES

Standard model includes 1½ hour UL Fire Damper Label. Approved for use in Fire Partitions with ratings up to 2 hours.

Meets all UL and NFPA requirements for PRIMARY FIRE DAMPERS.

Gravity operated for Vertical Installation. Available with closure springs and latches for horizontal installation.



A & B are Duct Dimensions D is Duct Diameter

NOTE: For overall Frame Dim. on type B, C, CR, & CO see appropriate IBD2 Spec. sheet.

TYPE A & B will be furnished approx. 1/4" less than given duct dims. TYPE C's will be furnished approx. 1/8" less than given duct dims.

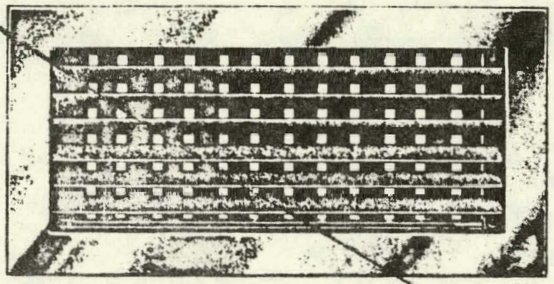
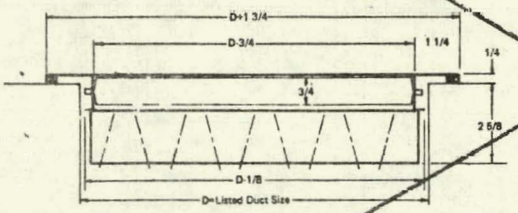
Supply Registers

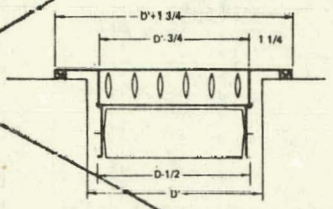
(STEEL) Core Styles 271 & 272



☐ **Model 271-RL-5** One set of AIRFOIL LOUVERS parallel to long dimension and individually adjustable to any degree of deflection in the vertical plane.

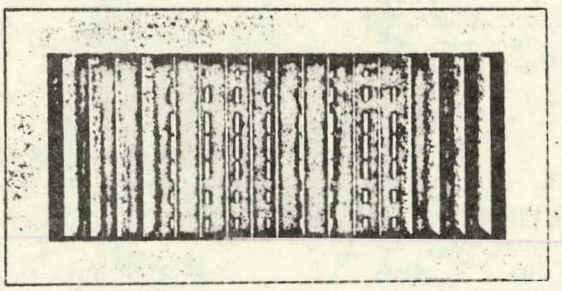
☐ **Model 271-RS-5** One set of AIRFOIL LOUVERS parallel to short dimension and individually adjustable to any degree of deflection in the horizontal plane.





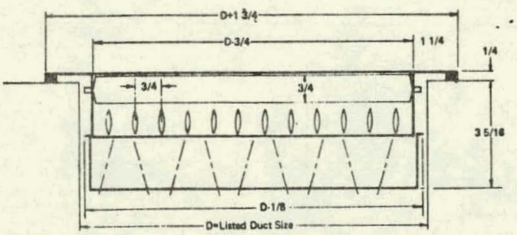
LOUVERS: One set of individually adjustable AIRFOIL louvers. Extruded aluminum — solid section.
LOUVER DEPTH: ¾". Assures positive air deflection.
DAMPER: Opposed Blade. Opposed acting blades are always parallel to short dimension and operated by standard screwdriver.

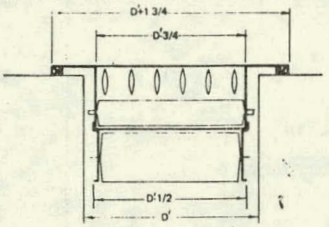
FINISH: Baked Aluminum Enamel.
GASKET: Polyurethane Foam
SIZES: Stocked in many standard sizes. Any size made to order.
BORDER: Cold Rolled Steel



☐ **Model 272-RL-5** Two sets of AIRFOIL LOUVERS. Front set parallel to long dimension and individually adjustable to any degree of deflection in vertical plane. Second set parallel to short dimension and individually adjustable to any degree of deflection in the horizontal plane.

☒ **Model 272-RS-5** Two sets of AIRFOIL LOUVERS. Front set parallel to short dimension and individually adjustable to any degree of deflection in horizontal plane. Second set parallel to long dimension and individually adjustable to any degree of deflection in vertical plane.





LOUVERS: Two sets of individually adjustable Airfoil louvers. Extruded aluminum — solid section.
LOUVER DEPTH: ¾" Assures positive air deflection.
DAMPER: Opposed blade, Screwdriver operated from face of register

BORDER: cold-rolled steel.
FINISH: Baked Aluminum Enamel.
GASKET: Polyurethane Foam

SPECIFICATION DATA

Furnish and install Cook type CH (SWSI) centrifugal blower, air [illegible] design. Fan Housing shall be all aluminum of the gauge stan[illegible] with the manufacturer for the size unit specified. Housing will [illegible] throughout with the spun aluminum venturi inlet bolted to the housing for access to the wheel. Blower wheel shaft will be stainless [illegible].

Blower wheel shall be all aluminum with extruded airfoil blades and cast aluminum back plate having an integral hub. Housing assembly will be supported on cast aluminum legs as shown on the drawing.

Split ring mounting bracket shall be an integral part of the blower to permit the blower housing to be rotated into any desired position (360 degree rotation) by loosening four bolts located at the support brackets to properly line up the discharge with the existing duct work.

Each unit shall be licensed by AMCA to bear the certified rating seal. Fan speed and horsepower shall be as shown on the drawing.

CERTIFIED RATINGS

Loren Cook Company certifies that the Type C[illegible] Blow[illegible] shown herein have been tested, and rated, in accor[illegible] the applicable AMCA Standard Test [illegible] Ratings Program and are licensed to bear the A[illegible] Ratings Seal. Performance shown is for Ty[illegible] Outlet duct. The AMCA Certified Rat[illegible]s [illegible]

The Type CH blower shown here has been [illegible] by the Canadian Standards Association [illegible] Laboratories. When [illegible]

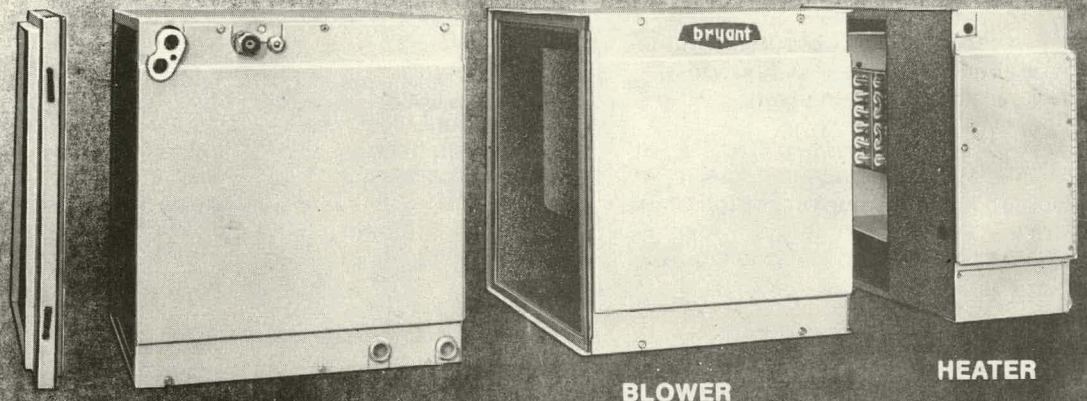
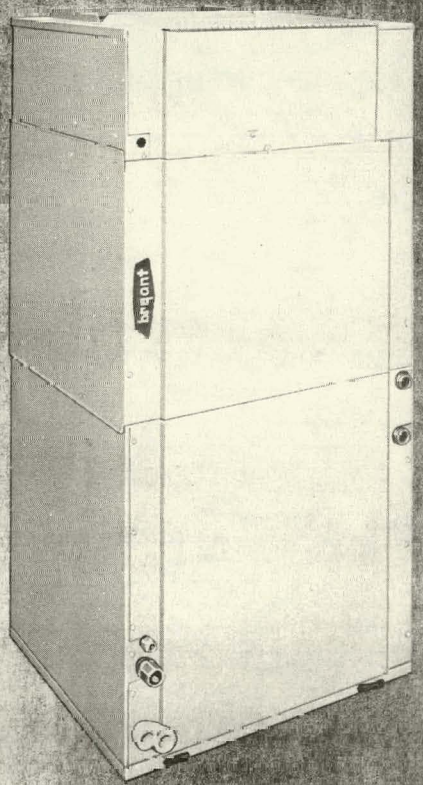
MODULAR FAN-COIL UNITS
Models 519A/MCC & 520B/BP



FILTER COIL BLOWER HEATER



The modular fan coil consists of a 519A/MCC Coil Section, a 520B/BP Blower Package section, and a heater section. These components can be used individually or in combination with each other. The 519A/MCC Modular Cased Coil is specifically designed for heat-pump-duty operation in combination with the 541B/SHP Outdoor Heat Pump sections. These coils can also be used for conventional air conditioning applications when combined with standard or deluxe condensing units. The 520B/BP Blower Package can be combined with the electric heater packages for conventional heating applications. Later, they can be combined with the modular cased coil for either heat pump or conventional air conditioning installations. Modular fan-coil components can be used in upflow, horizontal, or downflow installations.

Modular fan coils are available in 36,000-, 42,000-, 48,000-, and 60,000-Btuh nominal sizes. Electric heater packages range in nominal capacity from 8 to 30 KW. Heaters are available with either standard overcurrent protection or disconnecting circuit breakers. The fused and circuit breaker models provide overcurrent protection for both the heaters and the blower motor.

The versatility of the modular fan-coil components permits installation in a multitude of applications. Fan-coil sections are constructed of heavy-duty steel, with an attractive baked-enamel malibu-beige exterior. All cabinets are fully insulated for thermal and accoustic isolation.

FEATURES

519A/MCC DESIGN—Coils are computer-designed to provide optimum heat transfer during heating and cooling. Refrigerant and condensate connections are

bryant®
Bryant
Air Conditioning
Indianapolis, Indiana
La Puente, California

made on front of units for ease of installation. Flare refrigerant connections provide quick, leak-proof connections with matching refrigerant tube sets. Primary and secondary drain connections permit either vertical or horizontal applications.

CHECK-FLO-RATER—The 519A/MCC Coil includes the unique Check-Flo-Rater refrigerant metering device which eliminates potential serviceability requirements of check valves and expansion devices used in conventional heat pump fan coils. Because it is external, the Check-Flo-Rater is readily serviceable. For added reliability, a liquid-tube strainer assures clean, unrestricted operation.

520B/BP DESIGN—The blower package includes a permanent, washable air filter and filter rack. High-static, multispeed, direct-drive PSC blower motors provide proper air performance during heating and cooling. The motor is mounted on rubber isolators to prevent vibration and sound transmission.

ELECTRIC HEAT PACKAGES—Either disconnecting circuit breaker models or standard heater packages are available in all KW ratings. A low-voltage terminal block simplifies installation. The use of simplified low-voltage wiring systems increases the reliability of the field electrical hookup. Sequencers permit incremental energization and deenergization of the heating elements.

ACCESSORIES

Optional outdoor thermostats are available to energize incrementally the heating elements as a function of outdoor temperature. A uniquely designed automatic changeover room thermostat, with emergency heat switch and light, is available for the heat pump application of these modular fan coils. Optional return air plenums simplify their installation.

*Use copper wire only. If other than 60°C copper wire is used, size can be determined from unit ampacity given in above table applicable table of National Electric Code. Wire size must not create a voltage drop between service panel and unit in excess of 2% of unit rated voltage.
†Use 75°C copper wire.
‡Required for downflow applications.

NOTE: Circuit breakers of disconnect models are UL listed as disconnects for heater and blower when approved combinations are installed.

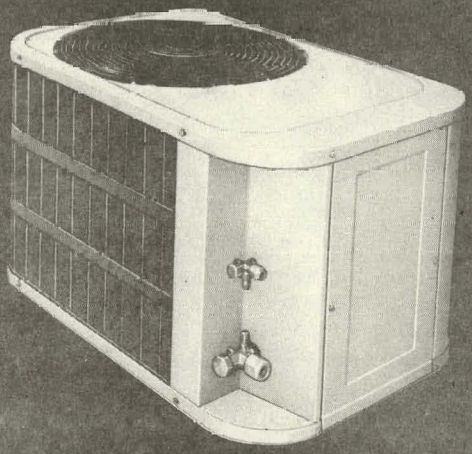
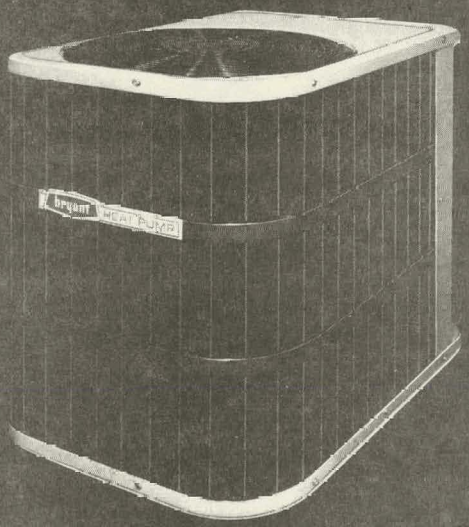
SPLIT-SYSTEM HEAT PUMP UNITS

Model 541B/SHP





The 541B/SHP Outdoor Sections of split-system heat pumps, are designed for quiet, reliable heating during the winter, and cooling during the summer. These heat pump systems provide economy of operation through energy conservation. The energy utilization efficiency of these heat pump systems during the heating season, is in many areas, more than double that of conventional electric space heating equipment. These units recover heat for indoor comfort from outdoor air during the heating season and, by automatically reversing the refrigerant system, remove indoor heat and excess humidity during the cooling season. All models have an ARI-certified cooling energy efficiency of 7.0 Btuh/Watt or better, with heating coefficiency of performance of 2.6 or better and 1.5 or better, respectively, at the 47°F and 17°F outdoor temperature rating points. The COP for all the units is 1.0 or better at −5°F outdoor temperature.

FEATURES

COMPRESSOR—Designed specifically for heat pump duty, with high energy efficiency during heating and cooling operation. Each compressor is hermetically sealed against contamination to assure long life and trouble-free performance. They are internally sprung and externally mounted on rubber isolators for quiet, vibration-free operation. Continuous, reliable operation can be achieved down to −40°F. All models include a discharge-tube muffler to prevent sound transmission of the compressor pulsations to the indoors or outdoors.

BUILT-IN RELIABILITY COMPONENTS—Include a suction-tube accumulator that keeps liquid refrigerant from reaching the compressor; low-pressure switch that stops the compressor if refrigerant charge is lost; a crankcase heater to keep the compressor oil warm and free of refrigerant for maximum lubricity; compressor relief valve for high-pressure protection; and compressor quick-start components to assure reliable operation of the units during brownout conditions and low outdoor temperatures.

WEATHER-PROTECTIVE CABINET—The low-profile design of the 541B/SHP units, with the pleasing malibu beige and jade exterior, blends in well with plants and shrubbery. Galvanized steel, coated with a layer of zinc phosphate to which a coat of alkyd melamine enamel is applied and baked on, is used throughout. This provides a hard, smooth finish that lasts for many years. All screws on the cabinet exterior are stainless steel for a durable, rust-free, quality appearance.

Bryant
Air Conditioning

Indianapolis, Indiana
La Puente, California

UNIT DESIGN—All units are equipped with totally enclosed fan motors for greater reliability under rain and snow conditions. The large, wraparound coil is designed for optimum heat transfer during heating and cooling. The vertical air discharge carries the sound and air up and away from adjacent patio areas and foliage. Sufficient space is provided between rows of composite coils so they can be cleaned with a common garden hose. A divider panel is installed between the compressor and coil section so that the unit can be checked and serviced while operating.

EXTERNAL SERVICE VALVES—Both brass refrigerant service valves are externally located so that refrigerant tube connections can be made quickly and easily. Each valve has a service port for ease of checking operating refrigerant pressures. The valves are designed for flare refrigerant tube connections.

HEAT-SAVING REVERSING VALVE—The operation of the reversing valve is designed so that when the room thermostat is satisfied, the reversing valve locks the hot refrigerant in the indoor coil. With the room thermostat set for continuous blower operation, this locked-in heat will be distributed through the living area after the outdoor unit has shut down—for additional energy conservation and reduced electrical bills.

TIME/TEMPERATURE DEFROST—The defrost cycle is initiated by a time/temperature control to clear the coil of frost and ice. The cycle is started only if the defrost thermostat senses ice buildup on the outdoor coil. After a few minutes, the control automatically returns the unit to the heating cycle.

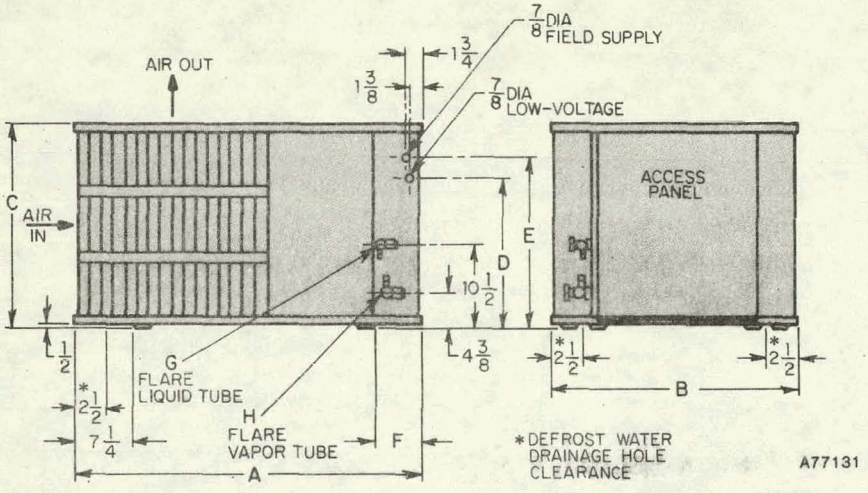
UNIQUE CHECK-FLO-RATER—The refrigerant metering for the outdoor and indoor units is done with the unique CHECK-FLO-RATER which eliminates the potential servicability requirements of check valves and expansion devices used in conventional heat pumps. For added reliability, a liquid-tube strainer assures clean unrestricted operation.

ACCESSORIES

A uniquely designed automatic changeover room thermostat, with emergency heat switch and light, is available for this line of heat pumps. Only the first bank of supplemental electric heaters is circuited through the second-stage heat anticipator to assure that the current flow always matches the anticipator setting. This minimizes the room temperature swing. Because of the simplified low-voltage circuitry, only the 30-KW units require an emergency heat relay to obtain the emergency heat function.

The outdoor thermostat kit includes a mounting bracket and thermostat for systems with 12- through 25-KW supplemental electric heaters. The thermostat, which mounts inside the Model 541B/SHP, is easily wired to the nearby low-voltage terminal board. An additional outdoor thermostat kit is available with a thermostat and emergency heat relay for use with systems having 30-KW supplemental electric heat.

A convenient unit mounting base kit is available to raise the 541B/SHP 8 inches above ground level. This kit is ideal for installation in areas where the snow level normally does not exceed 2 inches.



Clearance Requirements (In Inches)

Bottom of unit to ground or normal snow level..... 6
Inlet air (both sides and coil end)..... 12
Discharge air (top)..... 48
Service Clearance (compressor end)..... 30

NOTE: Unit can be installed with 6 in. clearance on LH side (facing control end of unit) when 24-in. clearance is maintained from RH side and coil end.

*If other than 60°C copper wire is used, size can be determined from unit ampacity given in above table and applicable table of National Electric Code. Wire size selected must have current capacity not less than that of copper wire specified and must not create a voltage drop between service panel and unit in excess of 2% of unit rated voltage.

†Rated in accordance with ARI Standard 270-75.

‡Rated in accordance with ARI Standard 240-76.

**The factory refrigerant charge is sufficient for systems requiring up to 30 ft of innerconnecting tubing. For tubing lengths greater than 30 ft see Installation Instructions for additional refrigerant requirements.

*Special order unit—consult factory for lead time required.

†If other than 60°C copper wire is used, size can be determined from unit ampacity given in above table and applicable table of National Electric Code. Wire size selected must have current capacity not less than that of copper wire specified and must not create a voltage drop between service panel and unit in excess of 2% of unit rated voltage.

‡Rated in accordance with ARI Standard 270-75.

**Rated in accordance with ARI Standard 240-76.

††The factory refrigerant charge is sufficient for systems requiring up to 30 ft of innerconnecting tubing. For tubing lengths greater than 30 ft see Installation Instructions for additional refrigerant requirements.

‡‡Required only for systems with 30-KW supplemental heat.

NOTES:

1. The Btuh heating capacity values shown are net "integrated" values from which the defrost effect has been subtracted. The Btuh heating from supplemental heaters should be added to these values to obtain total system capacity.
2. The KW values include the compressor, outdoor fan motor, and indoor blower motor. The KW from supplemental heaters should be added to these values to obtain total system KW.
3. See the Heating Performance Correction Factors Table for Ft^3/Min and indoor coil entering air temperature adjustments.

NOTE: When used with 519A042MCC/520B042BP, add 0.1 KW													

1. Total and sensible capacities are net capacities. Blower motor heat has been subtracted.
2. Sensible capacities shown are based on 80°F entering air at the indoor coil. For sensible capacities at other than 80°F, deduct 835 Btuh per 1000 Ft^3/Min of indoor coil air for each degree below 80°F, or add 835 Btuh per 1000 Ft^3/Min of indoor coil air per degree above 80°F.
3. Detailed cooling capacities are based on indoor and outdoor unit at the same elevation and connected by 30 feet of tubing. If other than 30 feet of tubing is used and/or indoor unit is located above outdoor unit, a slight variation in capacity may occur.
4. Unit KW is total of indoor and outdoor unit KW's.

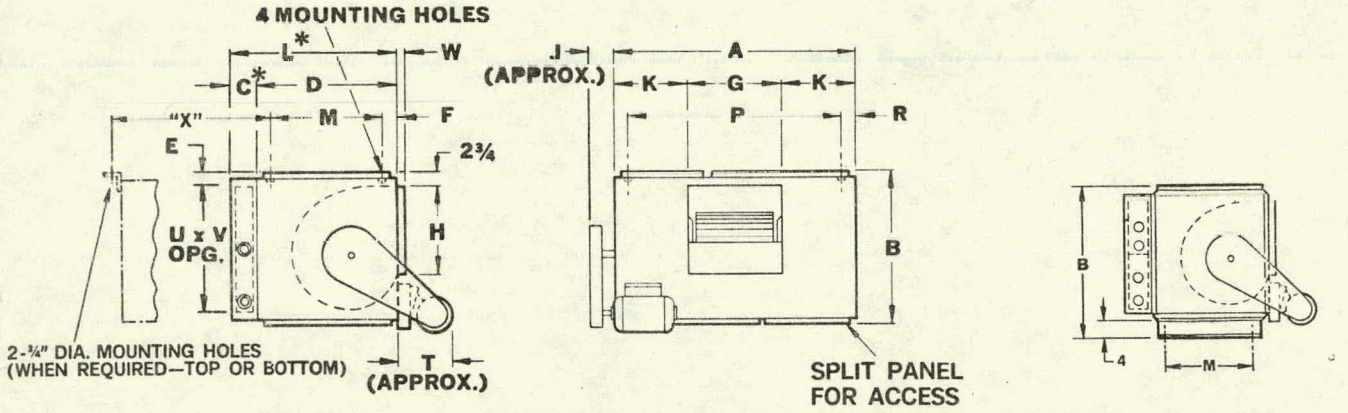
CERTIFIED DRAWING
281184Y

TYPE LHD

McQuay certifies that it will furnish equipment in accordance with this drawing and specifications, and subject to its published warranty. Purchaser's approval of this drawing signifies that the equipment is acceptable under the provisions of the job specifications. Any change made hereon by any person whomsoever is subject to acceptance by McQuay at its home office.

GENERAL SPECIFICATIONS

CABINET – GALVANIZED STEEL STRUCTURAL FRAME AND PANELS. ACCESS DOORS AND REMOVABLE PANELS PROVIDE COMPLETE ACCESSIBILITY TO INTERIOR.
FANS – GALVANIZED STEEL DYNAMICALLY BALANCED. BLADES RIVETED TO RIMS AND CENTER PLATE. CAST IRON HUBS.
HOUSINGS – GALVANIZED STEEL, DIE FORMED WITH SPOT WELDED SEAMS.
SHAFTS – SOLID HIGH CARBON STEEL SIZED SO THAT THE OPERATING SPEED IS WELL BELOW THE FIRST CRITICAL SPEED.
SHEAVES – MACHINED CAST IRON, "V" GROOVE TYPE, KEY SEATED TO SHAFT.
MOTOR MOUNT – ADJUSTABLE FOR VARYING BELT TENSION.
BEARINGS – SELF ALIGNING, BALL TYPE WITH GREASE FITTINGS AND EXTENDED LUBE LINES.
BELT GUARDS – GALVANIZED STEEL WITH FAN SHAFT TACHOMETER OPENING.



NOTE:
1. MOUNTING HOLE DATA:
   UNIT SIZES 103-228:
   5/8 V.C. TAPPED TOP OR BOTTOM
   UNIT SIZES 237-164:
   3/4 DIA. BOTTOM ONLY
2. UNIT SIZE 130-228 ARE SUITABLE FOR INVERTED MOUNTING.
3. FOR CEILING SUSPENSION, UNIT SIZES 237-164 MUST BE PLATFORM MOUNTED.
4. UNIT SIZES 237-164 WITH NO'S. 5, 6, 7 OR 8 FAN DISCHARGES REQUIRE SQUARED BLOWER SECTIONS. FOR SQUARED BLOWER SECTIONS ADD "Q" TO "D", "L" AND "M" DIMENSIONS.
5. "X" DIMENSION IS FOUND BY ADDING DIMENSION OF THE OPTIONAL SECTIONS USED PLUS 10-1/4" THRU UNIT SIZE 217 AND 10-3/4" THRU UNIT SIZE 164. INCLUDE 1/8" FOR GASKETING WHERE SECTIONS BOLT TOGETHER. IF 3 OR 4 ROW COIL USED ADD 3-1/2" TO THESE DIMENSIONS.

CABINETS WITH OPTIONAL A.F. FAN WHEELS
