INTRODUCTION

The technical staff of the DOE Technical Information Center, during its subject indexing activities, develops and structures a vocabulary that allows consistent machine storage and retrieval of information necessary to the accomplishment of the DOE mission. This thesaurus incorporates that structured vocabulary.

The terminology of this thesaurus is used for the subject control of information announced in DOE *Energy Research Abstracts, Energy Abstracts for Policy Analysis, Solar Energy Update, Geothermal Energy Update, Fossil Energy Update, Fusion Energy Update*, and *Energy Conservation Update*. This terminology also facilitates subject searching of the DOE technical information data base, a research in progress data base, which describes energy-related research, and a general and practical energy information data base on the DOE on-line retrieval system, RECON.

The rapid expansion of DOE's activities will result in a concomitant thesaurus expansion as information relating to new activities is indexed. Only the terms used in indexing documents at the Technical Information Center to date are included. The thesaurus will be published annually with cumulated updates being issued quarterly.

Terms in the thesaurus are listed alphabetically on a "word by word" basis. Each alphabetic entry is accompanied by a "word block" containing all the terms associated with the entry. In the word block, terms which have a hierarchical relationship to the entry are identified by the symbols BT and NT for Broader Term and Narrower Term. Terms with an affinitive relationship are identified by RT (Related Term); terms with a preferential relationship are identified by USE or SEE, and the reciprocals (UF and SF) are used to designate Used For and Seen For. Notes explaining restrictions imposed at TIC on the use of a particular descriptor are given for some of the terms. Descriptors added since December 1974 have the entry date and in some instances also contain a definition as part of the word block. A number [01] in square brackets listed to the right of some descriptors indicates terms that appear in a thesaurus (IAEA-INIS-13) published by the International Nuclear Information System (INIS). This indicator facilitates the input of nuclear related information published in the United States to the International Nuclear Information System (INIS).

Some descriptors in the thesaurus represent a class consisting of a large number of specific descriptors, e.g., even-even nuclei. Long lists of narrower terms in the word blocks of this type term are not always of equal usefulness to indexers and retrievers. Hence the display of these word blocks has been truncated in the main body of the thesaurus, and whenever this has been done it is indicated by an asterisk (*) at the level below which no narrower terms are listed. If the asterisk appears next to the alphabetic entry, i.e., when none of the narrower terms below the alphabetic entry are listed, the complete word block for the descriptor in question is given with full listings of narrower terms in the Appendix to the thesaurus. Furthermore, the alphabetic entry is followed by the scope note: "For specific terms, consult the Appendix." If the asterisk appears next to the reference indicator "NT" of a term *within* a word block, narrower terms more specific than that identified by the asterisk are not listed in that particular word block. They are listed, however, in the word block of the descriptor which is accompanied by the asterisk.

Comments, questions, or suggestions relating to the structure or terminology used in this thesaurus are welcome and should be addressed to:

CEA-ADL DUAL ALKALI PROCESS
DA June 1978
RT Desulfurization
RT Waste Processing
DEF Flue gas is passed through an absorption section where sulfur dioxide, chlorides, and sulfur trioxide are removed via contact with a solution of sodium salts. The sodium/sulfur salts are reacted with hydrated lime in a special 2-stage reactor to regenerate the sodium. Calcium/sulfur solids produced are separated from the liquor containing regenerated sodium compounds and disposed of. The regenerated liquor is recirculated to the absorption section.

RT Engineering
DEF Geology as applied to engineering practice, esp. mining and civil engineering. It is the application of geologic data, techniques, and principles to the study of naturally occurring rock and soil materials or ground water for the purpose of assuring that geologic factors affecting the location, planning, design, construction, operation, and maintenance of engineering structures, and the development of ground-water resources, are properly recognized and adequately interpreted, utilized, and presented for use in engineering practice.

DEF Coal is reacted with steam in a Fluidized-bed gasifier at 1500-1700°F. To provide the necessary heat, a stream of circulating char is withdrawn from the gasifier and partially burned with air in a char heater to raise its temperature. The heated char is returned to the gasifier after separation from the flue gas. The product gas is a medium BTU gas suitable for methanation to S.N.G.

EXXON LIQUEFACTION PROCESS
DA September 1976
BT1 Coal Liquefaction
BT2 Liquefaction
BT3 Thermochemical Processes
DEF Crushed coal is slurried with a recycle solvent, preheated to about 800°F, and then pumped into the liquefaction reactor operating at about 2,000 p.s.i. Preheated hydrogen is also added to the reactor. The product from the liquefaction reactor is sent to the separation step where gas, naphtha, recycle solvent, distillate, and heavy bottoms are separated by distillation.

DEF Dry oxidation of the sulfurous component of dry pulverized coal with gaseous NO_2 is followed by caustic washing to solubilize and remove sulfur compounds generated. The active oxidant, NO_2, can be generated at operating temperature and pressure in the reaction chamber by oxidation of NO feed gas.
