ABSTRACT

This document summarizes the available information concerning the decommissioning of the Ames Laboratory Research Reactor (ALRR), a five-megawatt heavy water moderated and cooled research reactor. The data were placed in a computerized information retrieval/manipulation system which permits its future utilization for purposes of comparative analysis. This information is presented both in detail in its computer output form and also as a manually assembled summarization which highlights the more important aspects of the decommissioning program. Some comparative information with reference to generic decommissioning data extracted from NUREG/CR 1756, "Technology, Safety and Costs of Decommissioning Nuclear Research and Test Reactors," is included.

NOTICE

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, or any of their employees, makes any warranty, expressed or implied, or assumes any legal liability of responsibility for any third party's use, or the results of such use, of any information, apparatus, product or process disclosed in this report, or represents that its use by such third party would not infringe privately owned rights.

Availability of Reference Materials Cited in NRC Publications

Most documents cited in NRC publications will be available from one of the following sources:

1. The NRC Public Document Room, 1717 H Street, N.W.
Washington, DC 20555
2. The NRC/GPO Sales Program, U.S. Nuclear Regulatory Commission,
Washington, DC 20555
3. The National Technical Information Service, Springfield, VA 22161

Although the listing that follows represents the majority of documents cited in NRC publications, it is not intended to be exhaustive.

Referenced documents available for inspection and copying for a fee from the NRC Public Document Room include NRC correspondence and internal NRC memoranda; NRC Office of Inspection and Enforcement bulletins, circulars, information notices, inspection and investigation notices; Licensee Event Reports; vendor reports and correspondence; Commission papers; and applicant and licensee documents and correspondence.

The following documents in the NUREG series are available for purchase from the NRC/GPO Sales Program: formal NRC staff and contractor reports, NRC-sponsored conference proceedings, and NRC booklets and brochures. Also available are Regulatory Guides, NRC regulations in the *Code of Federal Regulations*, and *Nuclear Regulatory Commission Issuances*.

Documents available from the National Technical Information Service include NUREG series reports and technical reports prepared by other federal agencies and reports prepared by the Atomic Energy Commission, forerunner agency to the Nuclear Regulatory Commission.

Documents available from public and special technical libraries include all open literature items, such as books, journal and periodical articles, and transactions. *Federal Register* notices, federal and state legislation, and congressional reports can usually be obtained from these libraries.

Documents such as theses, dissertations, foreign reports and translations, and non-NRC conference proceedings are available for purchase from the organization sponsoring the publication cited.

Single copies of NRC draft reports are available free upon written request to the Division of Technical Information and Document Control, U.S. Nuclear Regulatory Commission, Washington, DC 20555.

Copies of industry codes and standards used in a substantive manner in the NRC regulatory process are maintained at the NRC Library, 7920 Norfolk Avenue, Bethesda, Maryland, and are available there for reference use by the public. Codes and standards are usually copyrighted and may be purchased from the originating organization or, if they are American National Standards, from the American National Standards Institute, 1430 Broadway, New York, NY 10018.

1.0 INTRODUCTION

This document summarizes the available information concerning the decommissioning of the Ames Laboratory Research Reactor (ALRR) in the DECON mode, as defined in Section 1.1. Although the removal and disposal of the reactor and all reactor-associated equipment and material was completed, the existence of very low levels of residual radioactivity precluded the facility's release for "unrestricted use". Further information on final site conditions is presented in Section 5.0.

The decision to shut down and decommission the ALRR, made jointly by the Department of Energy and the Ames Laboratory, was brought about by continuing reductions in funding for basic nuclear research. Because the space utilized by the reactor and its associated equipment was considered desirable for future Laboratory activities, the DECON decommissioning mode was chosen in order to clear the space in question for "unrestricted use".

The prompt institution of the decommissioning program was determined to be necessary for several reasons; among them, a knowledgeable staff of reactor employees was available and could be maintained, and the inflationary escalation of costs could conceivably be minimized.

The services of a nuclear consultant firm were utilized for preparation of the necessary documentation, and in the pre-decommissioning cost estimates. The original sum budgeted for the decommissioning program was 4.5 million dollars. The decommissioning schedule called for completion of the physical work in 3 years and of post-decommissioning documentation in an additional six months. The actual work was completed nine months later than the original schedule and the large majority of required documentation completed at approximately the same time.

The decommissioning data were assembled in a form that permitted its input into a computerized data-handling system. The computer program used results in a flexible data accumulation, manipulation and retrieval system which can provide such benefits as:

- Greater accuracy of cost, labor and radiation exposure estimates
- Increased perception concerning ALARA responsiveness
- Guidance in time schedule projections
- Predictability of radiation and contamination levels

- Identification of special areas of difficulty in the decommissioning process

As the accumulation of data from actual decommissioning projects mounts, the value of the program as a decommissioning aid is enhanced. Some comparative information with reference to reference research and test reactors is included in Section 2.0.

1.1 Acronyms - Abbreviations - Definitions

Definitions of Decommissioning Alternatives

DECON - to immediately remove all radioactive material to permit unrestricted release of the property.

SAFSTOR - to fix and maintain property so that risk to safety is acceptable for period of storage followed by decontamination and/or decay to an unrestricted level.

ENTOMB - to encase and maintain property in a strong and structurally long-lived material (e.g., concrete) to assure retention until radioactivity decays to an unrestricted level.

2.0 FACILITY SUMMARY REPORT

This section contains a manually summarized duplication of the computer-output information presented in Section 7.0, and comparative information with reference to generic decommissioning data extracted from NUREG/CR 1756, "Technology, Safety and Costs of Decommissioning Nuclear Research and Test Reactors."

The purpose for this section is two-fold: (1) to provide the reader with a condensed overview of the decommissioning of a 5MWt D₂O research reactor, similar to several U.S reactors which will, of course, eventually be decommissioned, and (2) to present a brief comparison of major facets of the above decommissioning project with those of the generic decommissioning of a reference 1 MWt research reactor (RRR) and of a reference 60 MWt Test Reactor (RTR).

Cost information for RRR and RTR is assumed to be in 1981 dollars, while comparative ALRR information is assumed to be in approximate 1980 dollars. As ALRR cost items became due, they were paid on approximately the completion dates of the specific cost items being charged.

2.1 Facility Description

| | | |
|---|----------------------------|--------------------------|
| Name: ALRR | RRR | RTR |
| Ames Laboratory Research Reactor | Reference Research Reactor | Reference Test Reactor |
| Location: Ames, IA | Corvallis, OR | Sandusky, OH |
| Owner: Department of Energy | Oregon St. University | NASA |
| Operator: Ames Laboratory | OSU | NASA |
| Reactor Type: Research (D ₂ O) | TRIGA (Pool-Type) | Test, (H ₂ O) |
| Operating Lifetime: 12 yrs | 40 yr. (5% operating) | 40 yr. |
| Decommissioning Mode: DECON | DECON | DECON |
| Power Rating: 5 MWt | 1 MWt (Steady State) | 60 MWt |
| Lifetime Power: 15200 MWdt | 740 MWdt | 98000 MWdt |
| Reason for Decommissioning: Reduced funding | End-of-Life | End-of-Life |

2.2 Summary of Costs and Radioactive Waste

| | <u>ALRR</u> | <u>RRR</u> | <u>RTR</u> |
|--------------------------------------|-------------|------------|------------|
| Total Decommissioning Cost, Dollars: | 4,335,000 | 850,000 | 15,600,000 |
| Personnel Exposure, Manrem: | 69.4 | 18.3 | 322 |

| | <u>ALRR</u> | <u>RRR</u> | <u>RTR</u> |
|--|-------------|------------|------------|
| Radwaste Volume, Cu. Ft.: | 40,830 | 5650 | 174,200 |
| Radionuclide Inventory, Radwaste, Curies: | 6832 | 1500 | 369,000 |

2.3 Comparisons of Cost Items

2.3.1 Dollar Costs

The following listed items are compared to total dollar costs for the decommissioning project.

| <u>Item (Unit)</u> | <u>ALRR</u> | | <u>RRR</u> | | <u>RTR</u> | |
|---------------------------------|-------------------------|-------------------------------|-------------------------|--|-------------------------|-------------------------------|
| | <u>No. of Units</u> | <u>No. of \$ Per Unit</u> | <u>No. of Units</u> | <u>No. of \$ Per Unit</u> | <u>No. of Units</u> | <u>No. of \$ Per Unit</u> |
| Radionuclide Inventory (Ci.) | 6832 | 634.43 | 1500 | 56.67 <i>566.67</i> 150.44 | 369000 | 42.28 |
| Radwaste (Cu. Ft.) | 40830 | 106.18 | 5650 | 15.04 | 174200 | 89.55 |
| Lifetime Pwr. Output (MWdt) | 15200 | 285.16 | 740 | 114.86 <i>1148.65</i> | 98000 | 159.18 |
| Spending Rate (Mon) | 45 | 96320 | 8.5 | 100000. | 25 | 624000 |

2.3.2 Man-Rem Costs

The following listed items are compared to the total personnel exposure to radiation during the decommissioning program.

| <u>Item (Unit)</u> | <u>ALRR</u> | | <u>RRR</u> | | <u>RTR</u> | |
|---------------------------------|-------------------------|--|-------------------------|--|-------------------------|--|
| | <u>No. of Units</u> | <u>No. of Units Per Manrem</u> | <u>No. of Units</u> | <u>No. of Units Per Manrem</u> | <u>No. of Units</u> | <u>No. of Units per Manrem</u> |
| Radionuclide Inventory (Ci.) | 6832 | 98.44 | 1500 | 81.97 | 369000 | 1145.96 |
| Radwaste Volume (Cu. Ft.) | 40830 | 588.33 | 5650 | 308.74 | 174200 | 540.99 |
| Decommissioning Costs (\$) | 4335000 | 62460 | 850000 | 46450 | 15600000 | 48450 |

3.0 DESCRIPTION OF COMPUTER REPORTS

The reports described below are the basic reports used in the DDS program. The descriptions, as presented, are intentionally idealized. It should be understood that all functional facets of the reports will not always be utilized, simply because the documentation of decommissioning information will vary from project to project. In addition to the basic reports, MAPPER provides the ability to produce supplementary reports by manipulating the data available in the basic reports.

3.1 General Information

This report is a free format input report designed to accommodate descriptive data of any kind. Entries may be given any title and related to any facility system by a system component number. Data are entered in any format on any subject. The report should be used to record information that does not fit into any of the report types organized by column. This includes facility location, description, owners, operators, builders. Summary data may also be included where it is not readily derivable from other reports or for convenient reference.

3.2 Decommissioning Code Table/Index

This report contains a list of unit items, including facility buildings, systems and system components, and budgetary items, with a corresponding identification number for each unit. The identification system is used throughout DDS to relate data to specifically identified units.

This basic report type may be expanded to include tables or indices of other kinds related to facility decommissioning. Candidate tables are labor category wage rates, shipping company rates, shipping company name codes, disposal site name codes and rates, or archived file tape names.

One of the basic values of this report is the fact that, by utilizing an index which can ultimately be made common to all reactor facilities included in the program, the report can become the intercomparison base for the DDS. The full utilization of this base will not be possible until a certain minimum number of facilities as yet unspecified, are included in the DDS.

3.3 Significant Event Report

This report is used to record the facility's operating history, which in some cases could impact facility decommissioning. It contains dates, system/component numbers, and event descriptions. Noteworthy events such as construction completion, startup, shutdowns, significant incidents, and accidents are recorded in this report.

3.4 Radionuclide Inventory

An inventory of radionuclides present in each facility system will be made prior to the start of decommissioning. The amount of each radionuclide or its concentration, the measurement date, and a description of each system's material composition will be recorded. It will be noted whether a radionuclide present in a system is the result of neutron activation or contamination.

3.5 Project Cost/Exposure Report

Costs, schedules, man-hours, man-rem, both estimated and actual, are listed for each activity specification number. These costs may be broken out on lines having a subactivity specification number. This report is the main repository of cost and exposure information for a decommissioning project.

3.6 Dose Rate and Contamination Report

Dose rates at locations throughout each facility are recorded prior to decommissioning. Locations relative to a reference map, elevation, system/component number, and type of measurement are recorded for each measurement. Both upper and lower limits of dose rates or contamination levels (in disintegrations per minute) are listed.

3.7 Project Labor Report

Decommissioning labor costs, exposure, and man-weeks for each activity specification are recorded at a to-be-determined frequency. This supplements the project cost/exposure report by providing data on how costs and exposures accumulate over the course of a decommissioning project.

3.8 ALARA Report

The ALARA report contains records of ALARA efforts by activity specification number. The affected facility system, date, cost items, exposure information, and a description of the ALARA effort are listed. This report can be used to calculate by activity

specification number or for all activities the total estimated man-rem saved as well as total cost incurred through the implementation of the ALARA effort.

3.9 Shipment Report

Volumes, weights, and other physical data are recorded by waste type for material produced by each activity specification. These data are listed for each shipment of material from the decommissioning site. Trip lengths and vehicle dose rates are recorded in order to calculate public exposure.

3.10 Disposal Costs

The costs associated with each waste disposal shipment are recorded in the Disposal Costs Report. Costs are divided into transportation, burial, and container categories. Costs for each container type on the shipment are also listed.

3.11 Surveillance Report

The surveillance report is used to record annual costs and exposures associated with long term surveillance of a decommissioned facility. Under normal conditions a surveillance report would not be required for a facility decommissioned under Mode DECON.

3.12 Public Dose Report

The exposure of the public to radiation which results from the decommissioning of nuclear facilities is one criterion which is to be considered during the pre-decommissioning evaluation phase. This report presents an estimate of such exposure information, based on extrapolations of measurement data and numerous assumptions, including both routine and accident conditions.

4.0 COST ADJUSTMENTS

All cost information included in this document is presented in actual dollars as the charges were paid through the decommissioning program. For adjusting costs listed in the computer reports to year of interest, use the inflation rate table below.

Normalized Cost Escalation Table

| <u>Annual Inflation Rate *</u> | <u>Year</u> | <u>1970</u> | <u>1971</u> | <u>1972</u> | <u>1973</u> | <u>1974</u> | <u>1975</u> | <u>1976</u> | <u>1977</u> | <u>1978</u> | <u>1979</u> | <u>1980</u> | <u>1981</u> | <u>1982</u> |
|--|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 0.029 | 1966 | | | | | | | | | | | | | |
| 0.029 | 1967 | | | | | | | | | | | | | |
| 0.042 | 1968 | | | | | | | | | | | | | |
| 0.054 | 1969 | | | | | | | | | | | | | |
| 0.059 | 1970 | 1.000 | | | | | | | | | | | | |
| 0.043 | 1971 | 1.043 | 1.000 | | | | | | | | | | | |
| 0.033 | 1972 | 1.076 | 1.033 | 1.000 | | | | | | | | | | |
| 0.062 | 1973 | 1.138 | 1.095 | 1.062 | 1.000 | | | | | | | | | |
| 0.110 | 1974 | 1.248 | 1.295 | 1.172 | 1.110 | 1.000 | | | | | | | | |
| 0.091 | 1975 | 1.339 | 1.296 | 1.263 | 1.201 | 1.091 | 1.000 | | | | | | | |
| 0.058 | 1976 | 1.397 | 1.354 | 1.321 | 1.259 | 1.149 | 1.058 | 1.000 | | | | | | |
| 0.065 | 1977 | 1.462 | 1.419 | 1.386 | 1.324 | 1.214 | 1.123 | 1.065 | 1.000 | | | | | |
| 0.077 | 1978 | 1.539 | 1.496 | 1.463 | 1.401 | 1.291 | 1.200 | 1.142 | 1.077 | 1.000 | | | | |
| 0.113 | 1979 | 1.652 | 1.609 | 1.576 | 1.514 | 1.404 | 1.313 | 1.255 | 1.190 | 1.113 | 1.000 | | | |
| 0.135 | 1980 | 1.787 | 1.744 | 1.711 | 1.649 | 1.539 | 1.448 | 1.390 | 1.325 | 1.248 | 1.135 | 1.000 | | |
| 0.089 | 1981 | 1.876 | 1.833 | 1.800 | 1.738 | 1.628 | 1.537 | 1.479 | 1.414 | 1.337 | 1.224 | 1.089 | 1.000 | |
| 0.060** | 1982 | 1.936 | 1.893 | 1.860 | 1.798 | 1.688 | 1.597 | 1.539 | 1.474 | 1.397 | 1.284 | 1.149 | 1.060 | 1.000 |

Example: A cost paid in 1971 dollars would increase to a cost of 1.893 times the original, if paid in 1982 dollars.

*Source: Statistical abstract of the United States, 1981 Consumer Price Index.

**1982 data are interim estimated.

In planning for large decommissioning projects which cover long time spans or are scheduled to start at some time in the future, cost estimates should consider the "worth" of current money and then adjust cost estimates to reflect this consideration. This exercise, referred to as a "time value cost analysis", considers the year of expenditure, interim surveillance and maintenance costs, major non-routine maintenance costs, and inflation rates. "Worth" of current money is usually based upon an average yield on stable, non-speculative investments such as long and short-term treasury bills. A "time value cost analysis" results in a percentage value, referred to as the discount rate, which is used to discount the cost of a future project to the current "worth" of money. This discount rate includes consideration of financial uncertainties, such as project cost overruns, recovery costs for major accidents, etc.

Example - A discount rate of two percent yields the following table:

| <u>Year</u> | <u>Discount Factor</u> | <u>Year</u> | <u>Discount Factor</u> |
|-------------|----------------------------|-------------|----------------------------|
| 1 | 0.9804 | 6 | 0.8880 |
| 2 | 0.9612 | 7 | 0.8706 |
| 3 | 0.9423 | 8 | 0.8513 |
| 4 | 0.9238 | 9 | 0.8535 |
| 5 | 0.9057 | 10 | 0.8204 |

If project is estimated to cost \$10,000 during a time period six years from today, the amount of money presently required to be invested is (\$10,000) (0.8880) or \$8,800.

5.0 FINAL SITE CONDITION

5.1 Criteria

The original goal for decommissioning the ALRR as stated in the Environmental Impact Assessment was to place the building and site in condition for unrestricted use by removing the reactor-related radioactivity. The radiochemistry laboratories in a laboratory wing, the laboratory part of a Warehouse/Laboratory Building, and the Waste Disposal Building were excluded from the goal of unrestricted use since it was considered that they would be in continued use involving radioactive materials. However, removal of reactor-related radioactivity from these areas was included in the decommissioning plan.

The exact values of residual levels of radioactivity acceptable for unrestricted use were not well-defined and appeared to undergo change during the course of decommissioning. Guidelines used were those of DOE Order 5480.1, Chapter XI, Table II (also in 10-CFR-20, Appendix B), and the unrestricted use levels of NRC Regulatory Guide 1.86. The former are maximum values averaged over a year for the concentrations of radioactive isotopes in water and air releasable to the general public. The relationship between allowable residual radioactivity in soil and concrete and these values is not at all clear. The criteria originally suggested were that concentrations of radioactivity in water, soil and concrete of 10% of the Table II value for water could be allowed to remain. This was to be defined on a weight basis, i.e., concentrations in uCi/g of the material in place of uCi/ml of water used in Table II.

In informal discussion with CH, it was indicated that levels in the range of 1-3% of the Table II value should be the goal rather than 10% in guiding the removal of soil in areas which contained low levels of contamination.

The discovery of widespread low-level diffusion of tritiated water into the concrete of the reactor room floors and walls made it obvious that the criterion of 1-3% of the Table II value could not be met for tritium in this part of the building. An ANL-based Radiological Survey Group* stated in their report, "Interim Overview/Certification Activities Report for the Ames Laboratory Research Reactor Facility, Ames, Iowa" of February 11, 1981 that, "It is also quite evident, from

*Authorized to perform in behalf of the Department of Energy in matters concerning radiological safety.

the airborne tritium levels encountered, that the release of this structure for unrestricted use is not possible at this time or in the near future." This conclusion was endorsed by CH and agreed to by the Ames Laboratory and has been used as the basis for decontamination of the reactor room. However, this decision does not imply that the room cannot be used. Another conclusion by the Survey Group was that it appears possible "to essentially allow uncontrolled access" to the room as long as Health Physics surveillance of airborne tritium is maintained.

Exemptions from strict adherence to the unrestricted criteria for removal of radioisotopes other than tritium were granted for several pipe lines buried in concrete. These aspects of the problem are discussed in the next section.

5.2 Final Site Condition

The reactor and its associated systems, components and wastes were removed, and major decontamination was completed. Only the tasks of final detailed survey remain to be completed, and will be documented in the form of interim and final addenda to the final decommissioning report referenced in the General Information Report of Section 7.0.

5.2.1 Site, Other Structures and Reactor Building Outside the Reactor Room

In August and September 1981, soil samples were taken at two depths from 65 sites around the reactor building using a grid based on quadrant/radial segment areas centered on the reactor, including area inside and outside of the reactor exclusion fence. Samples were also taken from five control sites. To this date all control site samples and seven of the reactor site samples have been analyzed by gamma spectroscopy. All samples contain ^{137}Cs , but with no significant difference between reactor site and control samples. Additional samples have been prepared for gamma analysis and sufficient samples will be analyzed to provide adequate documentation.

Traces of radioactivity dating to pre-reactor days remain in a controlled waste holding area on the site which has been used by the Laboratory since 1950. Most of the radioactive material stored in this area was removed, and much of it included with decommissioning waste shipments. Survey results showed small areas of slightly contaminated soil, with uranium and thorium the major components.

The laboratory half of the Warehouse/Laboratory Building was not cleared of radioactivity because work with radioactive materials is expected to continue in these laboratories. However, no radioactivity

produced from or related to the ALRR remains. At present some neutron diffraction equipment which was slightly activated at the face of the reactor is stored in the warehouse half of this building. This equipment is considered by the experimenter to be too valuable to consign to waste and continues to be of potential usefulness in the continuing program in neutron scattering conducted by Ames Laboratory scientists at the Oak Ridge Reactor. This equipment is catalogued and will be kept on the record as radioactive as long as it shows radiation levels above background.

The Radioactive Waste Disposal Building will be maintained for handling, packaging and temporarily storing radioactive waste. Since shipments of waste in less than truck load quantities presents problems, storage may last for more than a year.

The Laboratory Wing of the Reactor Building includes several laboratories in which radioactive material from the ALRR was handled and used. It was earlier considered that these laboratories would continue to be utilized for radiochemical research, but programs which do not involve radioactivity were installed after decommissioning was completed, and the laboratories were decontaminated. The hood exhausts in the laboratories included horizontal runs of square ducts made of an asbestos composition. Since the ducts were slightly radioactive, they were removed, crushed, boxed and included in last waste shipments. The vertical runs of the hood exhausts to the roof, the exhaust fans and the fume hoods were surveyed for removable and fixed contamination and were decontaminated where necessary. One hood was decontaminated, removed and stored for future use within the *Laboratory*. The laboratories were decontaminated and surveyed. With the exception of tritium contamination the final survey showed the facility could be released for unrestricted use using the guidelines from NRC Regulatory Guide 1.86, "Termination of Operating Licenses for Nuclear Reactors."

The Staging Area section of the Reactor Building were cleared and surveyed. The accessible floors and walls were determined to be free of removable contamination.

5.2.2. Reactor Room and Basement

As stated above, it is not possible to release the Reactor Room for unrestricted use at this time because of the tritium present as tritiated water of hydration in the concrete. Since this action permits the use of the room as laboratory space, the removal of other radioisotopes which might further restrict the use of the room remained the objective with the unrestricted use criteria as the basis.

This objective has been achieved in all but a few inaccessible locations in buried drain lines. Exemption from strict application of the removal criteria for radioisotopes other than tritium was made on the basis of inaccessibility and the very small amounts of radioactivity. The walls and floor of the reactor room and basement were washed down and surveyed for both removable and fixed contamination. Removable activity met the unrestricted use criteria in all areas. In small areas scattered over the reactor room floor, the residual fixed activity level was above these criteria. A survey by the Radiological Survey Group showed a number of these areas, and others were found in a thorough survey by the Laboratory Health Physics Group. Since further scrubbing did not remove all of the radioactivity, various abrasive and chipping devices were used to remove a surface layer of concrete from 1/8 to 1/2 inch deep in these areas. The only reactor-related radioactivities identified in samples of the surface concrete by gamma spectroscopy were ^{137}Cs and ^{60}Co . Removal of a single thin layer of concrete usually reduced the contamination to below unrestricted use criteria. If the activity still exceeded these levels, the process was repeated. The ceiling, walls and floor areas of the main floor of the reactor room were brought to levels below the unrestricted use level of NRC Regulatory Guide 1.86 for all radioisotopes other than tritium.

On completion of this survey and decontamination effort, and of similar work in the reactor basement, staging area and other possibly contaminated areas, documentation will be presented in addenda to the final decommissioning report.

6.0 CONCLUSIONS AND LESSONS LEARNED*

Decommissioning of the Ames Laboratory Research Reactor was accomplished within the original budget authorization of \$4.5M.

Because of escalation, the cost of decommissioning cannot be directly compared to the construction costs.

A delay of approximately seven months occurred in one task as a result of contractor's problems and an unforeseen error in as-built drawings. Change in DOE policy on waste disposal caused a delay of about one month. With these exceptions, the original schedule was followed fairly closely. Completion was six to nine months later than scheduled, but preparation of the final report was not delayed as much.

The decision to proceed with decommissioning immediately after shutdown seems to have been correct. Although this action resulted in funding on an annual rather than a continuing basis, the original staff was intact to begin the work, and it otherwise would have been necessary to bring in more contract workers with much less knowledge of the system to be removed, in all likelihood at a greater cost. Also, the rate of inflation during the years of decommissioning has been usually high. Although this was not predictable, if the work had been postponed, the total cost would have been considerably greater.

The use of annually appropriated rather than line item funds which could be carried into subsequent fiscal years did create problems, particularly because of the delay in completion of one contract and the mandatory postponement of following work. The time available between the decision to shut down the reactor and the scheduled start of decommissioning was not sufficient to obtain funding as a line item.

The matter of the type of subcontracts to be used was discussed in planning the decommissioning. As is customary in the DOE, contracts were awarded on a fixed-bid basis, but some consideration was given to the use of cost-plus-fixed-fee contracts. In this project, the cost for subcontract work was unquestionably less with the fixed bid procedure. In two of the contracts, the low bid may have led to a substantial loss by the contractor. Soliciting bidders on a cost-plus

*The information presented in this section was taken from the final ALRR decommissioning report referenced on page 17 under "References".

basis would have cost more, but could have provided personnel with more experience leading to more prompt completion of the work. Whether greater prior experience is required and whether completion on schedule is worth the extra costs are debatable questions which depend on other circumstances.

It was suggested by subcontractors that they would rather see the complete work as a single package. It might be advantageous to include all of those tasks for which contractors were hired, e.g., core tank and thermal shield removal and pedestal demolition, in a single package to enhance continuity. However, time would still be required to prepare the bid specifications and it is doubtful if any savings in time or money would be realized. Several vendors would have welcomed the opportunity to provide managerial and/or engineering services for the complete task. Such contracts were not considered and it seems doubtful if the work would have proceeded any more smoothly or at a comparable cost under such an arrangement.

In future decommissioning projects it is suggested that the bid specifications be expanded to include more information on radiation levels and radioactivity content in order to assist the vendors in planning and preparing cost proposals. A major problem in providing this information is the potential exposure of personnel in obtaining it. The cost and time for the preparation of specifications would also be increased.

7.0 COMPUTER REPORTS

The following section comprises the basic computerized data which was taken from available documentation, stored reactor records and on-site interviews with Ames Laboratory employees associated with the decommissioning program.

NOTE 1- THE TOTAL TO BE OBTAINED FROM THIS COLUMN IS THE MEASURED PERSONNEL EXPOSURE TOTAL FOR THE ENTIRE DECOMMISSIONING PROJECT. ESTIMATION OF REACTOR EMPLOYEE EXPOSURE INFORMATION FOR INDIVIDUAL COST ITEMS WAS, HOWEVER, NECESSARY IN ORDER TO OBTAIN THAT TOTAL.

NOTE 2- INFORMATION INCLUDED HERE REPRESENTS TOTALS FOR LISTED COST ITEMS, INCLUDING SALARIES, SUPPLIES AND OUTSIDE SERVICES, CONTRACTS, PACKAGING, SHIPPING AND DISPOSAL.

NOTE 3- ACTUAL MAN-HOUR AND MAN-REM DATA SHOWN HERE INCLUDE ONLY CONTRACTOR INFORMATION FOR THE PERIOD OF TIME ENCOMPASSED BY THEIR CONTRACTS.

NOTE 4- RADIATION EXPOSURES INCURRED BY HEALTH PHYSICS EMPLOYEES ARE NOT SHOWN HERE, BUT INCLUDED IN EXPOSURE INFORMATION PRESENTED FOR ACTUAL INDIVIDUAL COST ITEMS.

ALRR-DECON U.N.C. DECOMMISSIONING DATA - SURVEILLANCE REPORT 74E1130

* .S. .<----- ANNUAL ----->.
* . DECOM ./EXPENDITUR. . MAN- .MAN- . COST .
*YEAR. MODE .M. ITEM .FREQ. REM .HOURS . \$. EXPENDITURE ITEM DESCRIPTION
=====

- . THE COST OF SURVEILLANCE ACTIVITIES REQUIRED SPECIFICALLY BECAUSE OF THE
- . PAST EXISTANCE OF THE REACTOR IS ABSORBED IN THE COST OF OTHER SURVEILLANCE
- . ACTIVITIES REQUIRED BY THE CONTINUING UTILIZATION OF RADIOACTIVE MATERIALS
- . IN LABORATORIES AT THE FACILITY.
- . MAINTENANCE COSTS ARE LIKEWISE ABSORBED. SECURITY ACTIVITIES IN AREAS WHICH
- . WERE ORIGINALLY WERE REACTOR-ASSOCIATED ARE NO LONGER NECESSARY BECAUSE THOSE
- . AREAS ARE ROUTINELY SECURED FROM CASUAL ENTRY.
